- If banding occurs in gradient fills, try printing with the Pattern halftoning option selected. (In the print dialog box, click the Color button, then select the Pattern option.)

Aldus PageMaker 5.0

- To see the Color StyleWriter 2400 Page Setup and Print dialog boxes, click the Setup button in PageMaker's Print dialog box.
- When printing rotated PICT or EPS images, be sure background printing is turned on in the Chooser. If you must print in the foreground, rotate the image in another program, then import it into PageMaker in the orientation in which you plan to print it.
- PageMaker 5.0 prints pages in reverse order on the Color StyleWriter 2400, which may be particularly confusing if you are using 2-up or 4-up printing. To print the first page first, turn on the Reverse Order option in the Print dialog box.

ClarisDraw 1.0v1

- If you have problems printing in the background, you may want to increase the Desktop PrintMonitor extension's preferred size to 300K (by using the Get Info command, as explained in the instructions that came with your Macintosh). The extension is located in the Extensions folder inside your System Folder.

ClarisImpact 1.0v1

- If you have problems printing ClarisImpact documents from a Power Macintosh,

upgrade to ClarisImpact 1.0v3.

DeltaGraph Pro 2.0.3

- When printing charts, always click the QuickDraw button in the Print dialog box.

FrameMaker 4.0

- Some FrameMaker documents, including some the Concern.Doc sample document that comes with the program, will not print with version 3.8.1 of Adobe Type Manger. If you try to print a document and your system crashes, try printing again after turning off or removing the ATM software.

- If you import text as a graphic, you can crop it on the screen but it will print uncropped.

- Rotated text in large point sizes will print as a gray box. For best results, break up the text blocks into smaller pieces or individual characters.

MacDraw II 1.1 v2

- To print in color, be sure to turn on the Print Color Patterns in the Print Options dialog box and select Color in the Image pop-up menu in the Print dialog box.

- If you experience problems when printing your MacDraw II document with layout of 2-Up or 4-Up, try using a different program, like ClarisDraw.

Microsoft Excel 4.0 and Lotus 1-2-3

- To print in color, be sure to check the Print Using Color option in the Print dialog box and select Color in the Image pop-up menu.

Microsoft Excel 5.0

- If colored cell borders drop out when printing, try using yellow or brown or you can use the line tool in the Drawing tools palatte.
- When you choose the Page Setup command, you get Excel's own version of the Page Setup dialog box. Click the Options button to see the version of the dialog box with the special Color StyleWriter 2400 options.

Microsoft Word 6.0

- When you cancel a print request from MicroSoft Word 6.0, some of the document will still print. If you are using desktop printing, try stopping the print queue on your desktop printer and then removing the print request instead of cancelling. To do this, click on you desktop printer icon and select Stop Print Queue from the Printing menu.

Ofoto 2.0

- For best results, make a custom calibration for the Color StyleWriter 2400 and click the Custom Profile button.

The Print Shop v1.3.2

- To print in color, select ImageWriter in the Preferences dialog box.

Print Shop Deluxe 1.0

- Make sure you open your document before printing.

SoftWindows 1.0

- You may not be able to print to your Color StyleWriter 2400 from SoftWindows. Contact Insignia Solutions Inc. for more information on printing from SoftWindows.

Studio/8 v 2.0 and Studio/32 v 1.2

- Always click the QuickDraw button in the Print dialog box.

Article Created: 22 February 1996

TOPIC -----

This article contains the read me file for the StyleWriter 1200 printer.

DISCUSSION -----

Information About Your StyleWriter 1200 Printer

This document contains important reminders and some information that's not in the user manual.

Installation and Setup Tips

Follow the instructions in the user manual to install the StyleWriter 1200 software. Keep the following tips in mind when setting up and working with your new software:

- After installing the printing software, you must create a desktop printer. To do so, select the StyleWriter 1200 in the Chooser, then close the Chooser.
- If you have a PowerBook computer, see "Special Information for PowerBook Users" in the section "Telling Your Computer to Use the StyleWriter 1200" in Chapter 1 of the user manual.
- If you get the message, "Serial port in use by another application, please quit the application and try again," restart your Macintosh before trying to print again.
- If you upgrade your system software, you must reinstall the StyleWriter 1200 software.
- Close the Chooser after making any changes to it.

- See the Troubleshooting chapter in the StyleWriter 1200 user manual for more information.
- If you have version 7.1 or 7.1.1 of the Macintosh Operating System (Mac OS) in any language besides English, the Installer program's Easy Install procedure will replace your version of the Finder with an English-language version. You can avoid this by using the Installer's Custom Install feature (instead of the Easy Install feature) to install PrintMonitor 7.1 and QuickDraw Printer Software. In that case, however, the desktop printer features will be unavailable to you.

About Desktop Printing

Your new printing software comes with Desktop PrintMonitor version 1.0.3. You use Desktop PrintMonitor to create printer icons (or "desktop printers") on your Mac OS desktop. You can print a document by simply dragging it to a desktop printer icon. Desktop printers also give you more control over printing, including setting printing priorities and choosing specific times for printing.

Installed Desktop Printing Files

The following files are installed for desktop printing on computers that use version 7.1 or later of the Mac OS:

- Desktop PrintMonitor, Desktop Printer Spooler, and Desktop Printer Extension are placed in the Extensions folder.
- If your computer has version 7.1.1 or 7.1.2 of the Mac OS, Finder 7.1.3 is placed in your System Folder and Finder Help 7.1.3 is placed in the Extensions folder.
- If your system has version 7.1.1 or 7.1.2 of the Mac OS, these files are placed in the Extensions folder: Thread Manager 2.1, Network Extension 7.1.3, Macintosh Drag and Drop, and Dragging Enabler.

Creating Desktop Printers

You create desktop printers by selecting a printer in the Chooser. A desktop printer icon appears on your desktop when you close the Chooser.

You can drag this icon to any position you want on your desktop. You cannot move it off the desktop.

If you want, you can select other printers in the Chooser and create other desktop printers for easy access. You must close the Chooser each time to create a desktop printer.

The last desktop printer created becomes the default printer. Your documents will automatically be printed on the default printer.

Printing With Desktop Printers

You can print documents within your applications as you normally do. You can

also print documents without leaving the Finder, using one of the two methods described here. These methods are particularly efficient when you have a number of documents created by the same application that you want to print at once.

- Drag the icons of the documents (all created by the same application) to the desktop icon of the printer you want to use.
- Select the icons of the documents you want to print and choose the Print command from the File menu.

The computer will show you the Print dialog box so you can choose printing options. Make your choices, then click the Print button.

After a few moments, the document starts to print. If background printing is turned on, you can continue working while the document is printing.

Selecting a Default Printer

If you have more than one printer available, you can select which you want to use. The printer you select is called the "default printer." All your documents will be printed on the default printer until you select a new one.

To change the default printer, use one of these three methods:

- Drag the document you want to print to a desktop printer icon, and it will automatically become the default printer.
- Select the desktop printer icon and use the Printing menu to set the printer as the default.
- Select a new printer using the Chooser.

Note: Switching between printers may change how much information you can fit on a page. It's best to choose a printer before you spend much time formatting the document.

Working With Desktop Printer Icons

Desktop printer icons change to indicate printing status:

You can do the following with desktop printer icons:

- Throw away the icon. Drag the icon to the Trash. You can't throw away a desktop printer icon while the printer is printing a document. (You can create another desktop printer icon for that printer whenever you like.)

Note:

You must always have at least one printer icon on your desktop. If you throw away the last icon, it will immediately be created again.

- Rename the icon. Rename the icon as you would any other Finder icon. Click the name to highlight it, then type the new name. This changes the name of the icon, not the name of the printer.

- Move the icon. You may drag the icon anywhere you like on the desktop. However, you may not move it off the desktop.
- Create an alias for the icon. You may create an alias for the icon as you would any Finder icon, by selecting the icon and choosing the Make Alias command from the File menu. The alias may be moved anywhere on or off the desktop.

Monitoring Printing

If you are using background printing, you can use the desktop printer features to monitor and control the documents that are waiting to print. To learn how to turn background printing on and off, see your printer manual.

To monitor the printing of documents:

- 1 Double-click the desktop printer icon you're interested in.

A window opens listing the documents that are printing or waiting to print.

Watching the status messages can be helpful when troubleshooting printing problems. When more than one job is waiting to be printed, a list of print jobs appears in the waiting list, showing the order in which they will be printed (when sorted by print time.)

- 2 Choose what you'd like to do.

- To cancel a print request, select it by clicking its icon and click the Remove button.

You can select only the currently printing document by clicking its icon. (You can select more than one item at a time by holding down the Shift key while clicking.) You can also drag the icon for the print request to the Trash. Note that these methods delete only the print request (also referred to as a spool file), not the document itself.

- To put a print request on hold, select it and click the Hold button.

The print request will stay on hold until you select it again and click the Resume button. You can also put the document that's currently printing on hold by dragging it to the list of documents waiting to print (lower part of the window).

- To indicate that a print request is urgent, select it and choose Set Print Time from the Printing menu. In the dialog box that opens, click Urgent.
- To indicate that a print request should not print until a future time, select it and choose Set Print Time from the Printing menu. In the dialog box that opens, click At Time, then set the time you want.
- To change the order of the items waiting to print, move their place in the list by dragging their titles up or down in the list.

- To sort the list of documents waiting to print, click the title of the column you want to sort by.

For example, to sort by the name of the document, click "Document Name." (You can also sort by choosing the commands in the View menu.) The column title you sorted by is underlined. Sorting the items does not change the order in which they will print. To see that order, sort by Print Time.

- To temporarily stop all documents from printing on this printer, choose Stop Print Queue from the Printing menu.

To resume using the printer, choose Start Print Queue from the Printing menu. If the Desktop PrintMonitor window is open, you can begin printing the document from the first page by Option-clicking the Resume button (holding down the Option key while clicking the Resume button).

Shortcut: The Printing menu for starting and stopping the print queue is available without opening the window for the printer, as long as the printer's icon is selected on the desktop.

- To move a print request from one printer to another printer of the same type (for example, from a StyleWriter 1200 to a StyleWriter 2400), drag the icon for the print request to the icon of the printer where you want to move it.

The printing software won't let you move a print request to an incompatible printer. For example, you can't move a request from a LaserWriter printer to a StyleWriter printer.

Turning the Manual Feed Notification On or Off

When you install the printer software, the Desktop PrintMonitor is set up to notify you about manually feeding paper the same way your PrintMonitor was set. For example, if you turned off notification for manual feeding in your PrintMonitor, the Desktop PrintMonitor will also have manual feed notification turned off.

If you want to change how the Desktop PrintMonitor notifies you about manual feeding, follow this procedure:

1. Hold down the Shift key and restart your computer, keeping the Shift key depressed until the message "Extensions off" or your normal desktop appears.
2. Open your System Folder and then open your Extensions folder.
3. Double-click the PrintMonitor application.
4. Choose Preferences from the File menu.
5. Select your manual feed option and click OK.
6. Close the PrintMonitor.

7. Restart your computer.

Turning Off or Removing the Desktop Printing Software

Removing a Desktop Printer Icon

You can remove an individual desktop printer icon by dragging it into the trash. If you have only one desktop printer, you can't get rid of the icon by dragging it to the Trash. (The icon will reappear if you do.) To get rid of the desktop printer, you must first select a different desktop printer as the default printer and then drag the desktop printer icon to the Trash. If you don't want to use desktop printer icons, see "Turning Off the Desktop PrintMonitor" or "Removing Desktop Printing Software" for information about how to remove the desktop printer software.

Turning Off the Desktop PrintMonitor

If you don't want to use desktop printers, you can turn off the Desktop PrintMonitor using the Extensions Manager (available on Macintosh System 7.5, the current version of the Mac OS).

To turn off the Desktop PrintMonitor:

1. Open the Extensions Manager control panel in the Control Panels folder.
2. Click to deselect (uncheck) the Desktop PrintMonitor, Desktop Printer Extension, and Desktop Printer Spooler extensions in the panel.
3. Click the close box to close the control panel.
4. Restart your computer.

Removing the Desktop Printing Software

The desktop printing software uses both the Desktop PrintMonitor and the PrintMonitor software. The Desktop PrintMonitor requires 200-400K bytes more free system memory in addition to the memory required by the PrintMonitor. If you don't want to use the desktop printing software, you can remove it.

To remove desktop printing software:

1. Restart your computer with the extensions off by holding down the Shift key and choosing Restart from the Special menu. Hold the Shift key down until the message "Extensions off" appears or until your normal desktop appears.
2. Drag the following files from the Extensions folder to the Trash:
 - Desktop PrintMonitor 1.0.3
 - Desktop Printer Spooler 1.0.3
 - Desktop Printer Extension 1.0.3

3. Restart your computer.

Using Save or Open with Desktop Printers

When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

Having More Than Five Desktop Printers

If you want to have more than five or six desktop printers, you must increase the Desktop PrintMonitor memory allocation by 12K for each additional desktop printer you want. To do so, select its icon (it's in the Extensions folder inside the System Folder), choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

About Creating Duplicate Desktop Printer Icons

If you use different versions of the printer software and print using the Desktop PrintMonitor, you may create duplicate desktop printer icons for the same printer. For example, say you select between two versions of the StyleWriter software. If you select your printer in the Chooser using one version, and select it later using the another version, two desktop printer icons will appear for that printer. To avoid creating confusing duplicate printer icons, primarily use one version of your printer software, or rename the icons with distinguishing names.

Using Desktop PrintMonitor on a Non-English System

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an older version of the PrintMonitor. Newer versions of the PrintMonitor are not replaced.) You have three choices:

- Use PrintMonitor 7.1.2 (or a later version)
- Obtain a set of installation disks of the printer software in the language of your system software from your Apple-authorized dealer and install it.
- Upgrade your system software to System 7.5 and install the printing software again. An English-language version of the Desktop PrintMonitor is installed.

Low-Memory Troubleshooting

If you notice any of these symptoms, your Macintosh may be running out of memory.

- The edges of some letters appear jagged.
- The Macintosh displays "out of memory" warning messages.
- Some portions of a document don't print.

– Some text prints in the Geneva font instead of the font you selected.

To make more memory available, try these suggestions:

- Have only one program open at a time.
- Increase the amount of memory you give to the program you're printing from by using the Get Info command (as explained in the documentation that came with your Macintosh).
- Use the Chooser to turn off background printing, as explained in Chapter 2 of the user manual.
- Remove any watermarks from your document.
- In the Page Setup dialog box, choose Portrait (normal) orientation instead of Landscape (sideways) orientation.
- Desktop printing requires more memory to print than the old PrintMonitor. You can remove desktop printing by using the custom install option called "PrintMonitor 7.1.2 (no Desktop Printing)."
- When you print in the background, if you often get a message that there is not enough memory to print on a certain desktop printer, you can give that desktop printer more memory by selecting its icon and choosing the Get Info command. Then increase the number in the Preferred Size box. (For more information on increasing a program's memory, see the documentation that came with your Macintosh.)
- As long as there are any print requests waiting to be printed, Desktop PrintMonitor (the desktop printing software) remains active in memory, even when background printing is off. If you are not printing in the background, you can remove all print requests from your desktop printer queues to reduce memory requirements by 160K.
- Use the Memory control panel to turn on virtual memory, as explained in the documentation that came with your Macintosh.
- Try a program like RamDoubler.
- See the "Troubleshooting" chapter in the StyleWriter 1200 user manual for more suggestions.

Watermark Tips

- When using a watermark, make sure the font that is in the watermark file is also in the Fonts folder inside your System Folder. If you give the watermark file to someone, they also need any fonts that it uses in order to use the watermark in their own documents.

Tips on Sharing Your Printer

- To avoid confusion, be sure to give each shared StyleWriter 1200 printer a unique name. If you have more than one printer with the same name in a single AppleTalk zone, the Chooser will display only one of them.
- To clean the print head of a shared StyleWriter 1200, you must send the request from the Macintosh that is directly connected to the printer.

Miscellaneous Printing Tips

- When printing very light colors in grayscale mode, you may see thin lines fade or break up. If this happens, pick a darker color for the affected object, or try printing with the Pattern halftoning option selected. (In the Print dialog box, click the Options button, then select the Pattern option.)
- For best results when printing envelopes, do not put images or text along the bottom edge of the envelope.
- If you use the StyleWriter 1200 software to print on an older StyleWriter as well as on the StyleWriter 1200, not all the valid options (such as glossy paper) will show up when you switch back to the StyleWriter 1200 until after you print at least one page.

Printing With QuickDraw GX

If you have QuickDraw GX on your system, the StyleWriter 1200 Installer will automatically install everything you need for printing with QuickDraw GX.

- If you installed QuickDraw GX after you set up your StyleWriter 1200, you must reinstall the StyleWriter 1200 software.
- After you click the Print button to print a complex document, you may notice a delay before you see printer activity.

If printing with QuickDraw GX doesn't produce satisfactory results, you can use the GX Helper utility to turn off QuickDraw GX and use the regular QuickDraw printing software. For more information, see Appendix E of your user manual.

Using the StyleWriter 1200 With Application Programs

If you have problems printing from a specific program, it may be a problem in that program. If you have problems, contact the publisher of the program. In some cases a newer, more compatible version of the software may be available.

- In some programs—such as Microsoft Word 5.1, WordPerfect 3.0, ClarisWorks 2.0, and Symantec GreatWorks 2.0—rotated text created within the program may print with jagged edges. For best results, create the rotated text in another program and paste it in.

Notes About Specific Programs

..TIL19388-StyleWriter_1200-Software_v2-1-2_Readme_2-96_(TA35109).pdf

The following list describes some special situations that you should be aware of when working with specific programs. (There may be other problems with these programs or with other programs not mentioned in this document.)

Adobe Type Manager

- If you rotate Adobe Type 1 fonts in FreeHand 3.11 and then paste them into another program, your Macintosh will display a system error when you try to print.
- If you print rotated Adobe Type 1 fonts using FrameMaker 4.0, your Macintosh will display a system error.
- If you print rotated Adobe Type 1 fonts that are also bold or italic using Intellidraw, and text will not print, you probably need to upgrade to ATM version 3.8.1.
- If you get incorrect output when you try to print rotated and flipped Adobe Type 1 fonts, try using a TrueType font instead.
- When Adobe Type 1 fonts are both outlined and underlined, characters may be misprinted (incorrect locations, multiple characters in same location, lower portions of characters shift left or right).

Adobe Dimensions

- Always print your documents in the foreground when using Adobe Dimensions. To turn background printing off, open the Chooser, click Off for Background Printing. If you accidentally print in background and your Macintosh crashes, you may have to restart with extensions off, open your desktop printer and drag all print requests from the queue.

Adobe Illustrator 5.0

- Unless you have at least 10 MB of free disk space on your startup disk, you will see a "disk is full" error message when you try to print. The more complex the document, the more space you need.
- If banding occurs in gradient fills, try printing with the Pattern halftoning option selected. (In the print dialog box, click the Options button, then select the Pattern option.)

Aldus PageMaker 5.0

- To see the StyleWriter 1200 Page Setup and Print dialog boxes, click the Setup button in PageMaker's Print dialog box.
- When printing rotated PICT or EPS images, be sure background printing is turned on in the Chooser. If you must print in the foreground, rotate the image in another program, then import it into PageMaker in the orientation in which you plan to print it.
- PageMaker 5.0 prints pages in reverse order on the StyleWriter 1200, which may

be particularly confusing if you are using 2-up or 4-up printing. To print the first page first, turn on the Reverse Order option in the Print dialog box.

ClarisDraw 1.0v1

- If you have problems printing in the background, you may want to increase the Desktop PrintMonitor extension's preferred size to 300K (by using the Get Info command, as explained in the instructions that came with your Macintosh). The extension is located in the Extensions folder inside your System Folder.

ClarisImpact 1.0v1

- If you have problems printing ClarisImpact documents from a Power Macintosh, upgrade to ClarisImpact 1.0v3.

DeltaGraph Pro 2.0.3

- When printing charts, always click the QuickDraw button in the Print dialog box.

FrameMaker 4.0

- If you import text as a graphic, you can crop it on the screen but it will print uncropped.
- Rotated text in large point sizes will print as a gray box. For best results, break up the text blocks into smaller pieces or individual characters.

MacDraw II 1.1 v2

- To print in grayscale, follow the usual instructions and also turn on the Print Color Patterns in the Print Options dialog box and select Color in the Image pop-up menu in the Print dialog box.
- If you experience problems when printing your MacDraw II document with layout of 2-Up or 4-Up, try using a different program, like ClarisDraw.

Microsoft Excel 4.0 and Lotus 1-2-3

- To print in grayscale, check the Print Using Color option in the Print dialog box and select Color in the Image pop-up menu.

Microsoft Excel 5.0

- If colored cell borders drop out when printing, try using yellow or brown or you can use the line tool in the Drawing tools palette.

Microsoft Word 6.0

- When you cancel a print request from MicroSoft Excel 6.0, some of the document will still print. If you are using desktop printing, try stopping the print queue on your desktop printer and then removing the print request instead of cancelling. To do this, click on you desktop printer icon and select Stop Print

Queue from the Printing menu.

Print Shop Deluxe 1.0

- Make sure you open your document before printing.

SoftWindows 1.0

- You may not be able to print to your StyleWriter 1200 from SoftWindows. Contact Insignia Solutions Inc. for more information on printing from SoftWindows.

Studio/8 v 2.0 and Studio/32 v 1.2

- Always click the QuickDraw button in the Print dialog box.

Workgroup Server 6150, 7250, 8550: Comparison Chart (3/97)

Revised: 3/3/97
Security: Everyone

Workgroup Server 6150, 7250, 8550: Comparison Chart (3/97)

Article Created: 22 February 1996
Article Reviewed/Updated: 3 March 1997

TOPIC -----

This article is a comparison chart for the Workgroup Server 6150, 7250, and 8550.

DISCUSSION -----

Here is a chart comparing the Workgroup Server 6150, 7250, and 8550.

Begin_Table

Product Features	6150/66	7250/120	8550/132
Processor	601/66 MHz	601/120 MHz	604/132 MHz
L2 Cache	256 KB	256 KB	512 KB
CPU Card	No	No	Yes
RAM (shipping with)	16 MB	16 MB	24 MB
RAM (expandable to)	128 MB	256 MB	512 MB
Number of RAM Slots	2	4	8
VRAM	DRAM video	1 MB (2)	2 MB (2)
Number of VRAM Slots	n/a	4	4
Expansion Slots	1PDS/NuBus	3 PCI	3 PCI
Drive Bays	3	4	4 (1)
Internal HD	1.2 GB	1.2 GB	2 GB
Internal CD Player	AppleCD 600i	AppleCD 600i	AppleCD 600i
Internal Floppy Drive	1.4MB SuperDrive	1.4MB SuperDrive	1.4MB SuperDrive
Internal DAT Drive	n/a	n/a	DDS-2 DAT Drive
System SW	MacOS 7.5.1	MacOS 7.5.3	MacOS 7.5.3
		OT 1.1	OT 1.1
Configurations	Two	Three	Four

End_Table

(1) The Workgroup Server 8550 has four drive bays set up by Apple. An additional "fifth" drive bay can be added to the lowest bay, but the drive cage and cable have to be provided by a third party and installed by an authorized Apple service technician.

(2) VRAM DIMMs must be 112-pin fast-paged mode, 32 bit wide, and 70 ns RAM access time or faster. Do not use 256K VRAM SIMMs.

Article Change History:

03 Mar 1997 - Added keyword.

05 Dec 1996 - Added information on number of RAM slots.

03 Jun 1996 - Added information on VRAM.

DISCUSSION -----

Information About Your Color StyleWriter 2200 Printer

This document contains important reminders and some information that's not in the user manual.

Installation and Setup Tips

Follow the instructions in the user manual to install the Color StyleWriter 2200 software. Keep the following tips in mind when setting up and working with your new software:

- If you are having problems during installation, restart with Extensions off and try installing again.
- After installing the printing software, you must create a desktop printer. To do so, select the Color SW 2200 in the Chooser, then close the Chooser.
- If you have a PowerBook computer, see "Special Information for PowerBook Users" in the section "Telling Your Computer to Use the Color StyleWriter 2200" in Chapter 1 of the user manual.
- If you get the message, "Serial port in use by another application, please quit the application and try again," restart your Macintosh before trying to print again.
- If you upgrade your system software, you must reinstall the Color StyleWriter

2200 software.

- Close the Chooser after making any changes to it.
- See the Troubleshooting chapter in the Color StyleWriter 2200 user manual for more information.

About Desktop Printing

Your new printing software comes with Desktop PrintMonitor version 1.0.3. You use Desktop PrintMonitor to create printer icons (or "desktop printers") on your Macintosh Operating System (Mac OS) desktop. You can print a document by simply dragging it to a desktop printer icon. Desktop printers also give you more control over printing, including setting printing priorities and choosing specific times for printing.

Installed Desktop Printing Files

The following files are installed for desktop printing on computers that use version 7.1 or later of the Mac OS:

- Desktop PrintMonitor, Desktop Printer Spooler, and Desktop Printer Extension are placed in the Extensions folder.
- If your computer has version 7.1.1 or 7.1.2 of the Mac OS, Finder 7.1.3 is placed in your System Folder and Finder Help 7.1.3 is placed in the Extensions folder.
- If your system has version 7.1.1 or 7.1.2 of the Mac OS, these files are placed in the Extensions folder: Thread Manager 2.1, Network Extension 7.1.3, Macintosh Drag and Drop, and Dragging Enabler.

Creating Desktop Printers

You create desktop printers by selecting a printer in the Chooser. A desktop printer icon appears on your desktop when you close the Chooser.

You can drag this icon to any position you want on your desktop. You cannot move it off the desktop.

If you want, you can select other printers in the Chooser and create other desktop printers for easy access. You must close the Chooser each time to create a desktop printer.

The last desktop printer created becomes the default printer. Your documents will automatically be printed on the default printer.

Printing With Desktop Printers

You can print documents within your applications as you normally do. You can also print documents without leaving the Finder, using one of the two methods described here. These methods are particularly efficient when you have a number of documents created by the same application that you want to print at once.

- Drag the icons of the documents (all created by the same application) to the desktop icon of the printer you want to use.
- Select the icons of the documents you want to print and choose the Print command from the File menu.

The computer will show you the Print dialog box so you can choose printing options. Make your choices, then click the Print button.

After a few moments, the document starts to print. If background printing is turned on, you can continue working while the document is printing.

Selecting a Default Printer

If you have more than one printer available, you can select which you want to use. The printer you select is called the "default printer." All your documents will be printed on the default printer until you select a new one.

To change the default printer, use one of these three methods:

- Drag the document you want to print to a desktop printer icon, and it will automatically become the default printer.
- Select the desktop printer icon and use the Printing menu to set the printer as the default.
- Select a new printer using the Chooser.

Note: Switching between printers may change how much information you can fit on a page. It's best to choose a printer before you spend much time formatting the document.

Working With Desktop Printer Icons

Desktop printer icons change to indicate printing status:

You can do the following with desktop printer icons:

- Throw away the icon. Drag the icon to the Trash. You can't throw away a desktop printer icon while the printer is printing a document. (You can create another desktop printer icon for that printer whenever you like.)

Note: You must always have at least one printer icon on your desktop. If you throw away the last icon, it will immediately be created again.

- Rename the icon. Rename the icon as you would any other Finder icon. Click the name to highlight it, then type the new name. This changes the name of the icon, not the name of the printer.
- Move the icon. You may drag the icon anywhere you like on the desktop. However, you may not move it off the desktop.

- Create an alias for the icon. You may create an alias for the icon as you would any Finder icon, by selecting the icon and choosing the Make Alias command from the File menu. The alias may be moved anywhere on or off the desktop.

Monitoring Printing

If you are using background printing, you can use the desktop printer features to monitor and control the documents that are waiting to print. To learn how to turn background printing on and off, see your printer manual.

To monitor the printing of documents:

- 1) Double-click the desktop printer icon you're interested in.

A window opens listing the documents that are printing or waiting to print.

Watching the status messages can be helpful when troubleshooting printing problems. When more than one job is waiting to be printed, a list of print jobs appears in the waiting list, showing the order in which they will be printed (when sorted by print time.)

- 2) Choose what you'd like to do.

- To cancel a print request, select it by clicking its icon and click the Remove button.

You can select only the currently printing document by clicking its icon. (You can select more than one item at a time by holding down the Shift key while clicking.) You can also drag the icon for the print request to the Trash. Note that these methods delete only the print request (also referred to as a spool file), not the document itself.

- To put a print request on hold, select it and click the Hold button.

The print request will stay on hold until you select it again and click the Resume button. You can also put the document that's currently printing on hold by dragging it to the list of documents waiting to print (lower part of the window).

- To indicate that a print request is urgent, select it and choose Set Print Time from the Printing menu. In the dialog box that opens, click Urgent.

- To indicate that a print request should not print until a future time, select it and choose Set Print Time from the Printing menu. In the dialog box that opens, click At Time, then set the time you want.

- To change the order of the items waiting to print, move their place in the list by dragging their titles up or down in the list.

- To sort the list of documents waiting to print, click the title of the column you want to sort by.

For example, to sort by the name of the document, click "Document Name." (You can also sort by choosing the commands in the View menu.) The column title you sorted by is underlined. Sorting the items does not change the order in which they will print. To see that order, sort by Print Time.

- To temporarily stop all documents from printing on this printer, choose Stop Print Queue from the Printing menu.

To resume using the printer, choose Start Print Queue from the Printing menu. If the Desktop PrintMonitor window is open, you can begin printing the document from the first page by Option-clicking the Resume button (holding down the Option key while clicking the Resume button).

Shortcut: The Printing menu for starting and stopping the print queue is available without opening the window for the printer, as long as the printer's icon is selected on the desktop.

- To move a print request from one printer to another printer of the same type (for example, from a StyleWriter 1200 to a StyleWriter 2400), drag the icon for the print request to the icon of the printer where you want to move it.

The printing software won't let you move a print request to an incompatible printer. For example, you can't move a request from a LaserWriter printer to a StyleWriter printer.

Turning the Manual Feed Notification On or Off

When you install the printer software, the Desktop PrintMonitor is set up to notify you about manually feeding paper the same way your PrintMonitor was set. For example, if you turned off notification for manual feeding in your PrintMonitor, the Desktop PrintMonitor will also have manual feed notification turned off.

If you want to change how the Desktop PrintMonitor notifies you about manual feeding, follow this procedure:

1. Hold down the Shift key and restart your computer, keeping the Shift key depressed until the message "Extensions off" or your normal desktop appears.
2. Open your System Folder and then open your Extensions folder.
3. Double-click the PrintMonitor application.
4. Choose Preferences from the File menu.
5. Select your manual feed option and click OK.
6. Close the PrintMonitor.
7. Restart your computer.

Turning Off or Removing the Desktop Printing Software

Removing a Desktop Printer Icon

You can remove an individual desktop printer icon by dragging it into the trash. If you have only one desktop printer, you can't get rid of the icon by dragging it to the Trash. (The icon will reappear if you do.) To get rid of the desktop printer, you must first select a different desktop printer as the default printer and then drag the desktop printer icon to the Trash. If you don't want to use desktop printer icons, see "Turning Off the Desktop PrintMonitor" or "Removing Desktop Printing Software" for information about how to remove the desktop printer software.

Turning Off the Desktop PrintMonitor

If you don't want to use desktop printers, you can turn off the Desktop PrintMonitor using the Extensions Manager (available on Macintosh System 7.5, the current version of the Mac OS).

To turn off the Desktop PrintMonitor:

1. Open the Extensions Manager control panel in the Control Panels folder.
2. Click to deselect (uncheck) the Desktop PrintMonitor, Desktop Printer Extension, and Desktop Printer Spooler extensions in the panel.
3. Click the close box to close the control panel.
4. Restart your computer.

Removing the Desktop Printing Software

The desktop printing software uses both the Desktop PrintMonitor and the PrintMonitor software. The Desktop PrintMonitor requires 200-400K bytes more free system memory in addition to the memory required by the PrintMonitor. If you don't want to use the desktop printing software, you can remove it.

To remove desktop printing software:

1. Restart your computer with the extensions off by holding down the Shift key and choosing Restart from the Special menu. Hold the Shift key down until the message "Extensions off" appears or until your normal desktop appears.
2. Drag the following files from the Extensions folder to the Trash:
 - Desktop PrintMonitor 1.0.3
 - Desktop Printer Spooler 1.0.3
 - Desktop Printer Extension 1.0.3
3. Restart your computer.

Using Save or Open with Desktop Printers

When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

Having More Than Five Desktop Printers

If you want to have more than five or six desktop printers, you must increase the Desktop PrintMonitor memory allocation by 12K for each additional desktop printer you want. To do so, select its icon (it's in the Extensions folder inside the System Folder), choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

About Creating Duplicate Desktop Printer Icons

If you use different versions of the printer software and print using the Desktop PrintMonitor, you may create duplicate desktop printer icons for the same printer. For example, say you select between two versions of the StyleWriter software. If you select your printer in the Chooser using one version, and select it later using the another version, two desktop printer icons will appear for that printer. To avoid creating confusing duplicate printer icons, primarily use one version of your printer software, or rename the icons with distinguishing names.

Using Desktop PrintMonitor on a Non-English System

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an older version of the PrintMonitor. Newer versions of the PrintMonitor are not replaced.) You have three choices:

- Use PrintMonitor 7.1.2 (or a later version)
- Obtain a set of installation disks of the printer software in the language of your system software from your Apple-authorized dealer and install it.
- Upgrade your system software to System 7.5 and install the printing software again. An English-language version of the Desktop PrintMonitor is installed.

Low-Memory Troubleshooting

If you notice any of these symptoms, your Macintosh may be running out of memory.

- The edges of some letters appear jagged.
- The Macintosh displays "out of memory" warning messages.
- Some portions of a document don't print.
- Some text prints in the Geneva font instead of the font you selected.

To make more memory available, try these suggestions:

- Have only one program open at a time.
- Increase the amount of memory you give to the program you're printing from by using the Get Info command (as explained in the documentation that came with your Macintosh).
- Use the Chooser to turn off background printing, as explained in Chapter 2 of the user manual.
- Remove any watermarks from your document.
- In the Page Setup dialog box, choose Portrait (normal) orientation instead of Landscape (sideways) orientation.
- Choose Normal in the Print dialog box and Pattern in the Print Options dialog box.
- Desktop printing requires more memory to print than the old PrintMonitor. You can remove desktop printing by using the custom install option called "PrintMonitor 7.1 (no Desktop Printing)".
- When you print in the background, if you often get a message that there is not enough memory to print on a certain desktop printer, you can give that desktop printer more memory by selecting its icon and choosing the Get Info command. Then increase the number in the Preferred Size box. (For more information on increasing a program's memory, see the documentation that came with your Macintosh.)
- As long as there are any print requests waiting to be printed, Desktop PrintMonitor (the desktop printing software) remains active in memory, even when background printing is off. If you are not printing in the background, you can remove all print requests from your desktop printer queues to reduce memory requirements by 160K.
- Use the Memory control panel to turn on virtual memory, as explained in the documentation that came with your Macintosh.
- Try a program like RamDoubler.
- See the "Troubleshooting" chapter in the Color StyleWriter 2200 user manual for more suggestions.

Color Printing Tips

- When printing very light colors in grayscale mode, you may see thin lines fade or break up. If this happens, pick a darker color for the affected object, or try printing with the Pattern halftoning option selected. (In the Print dialog box, click the Color button, then select the Pattern option.)
- If you print a document that should have a smooth gradient from one color or shade to another and notice an unexpected color change, it may be that one of

the colors in the gradient cannot be reproduced by the printer. Try using a different matching method in the Color Options dialog box, or try turning off ColorSync.

- If the blues on your printout appear purple, turn on ColorSync in the Color dialog box.
- In some programs, colors on the screen may look solid but contain tiny black dots when printed. To print solid blocks of color without these black dots, use the Business Graphics color-matching method. In the Print dialog box, click the Color button. In the Color Options dialog box that appears, make sure there is an X in the ColorSync box, and then select Business Graphics from the Matching Method pop-up menu.

If your colors still have too many black dots, create the document in a program that allows you to define each color, then make the color fully saturated. For example, to print yellow without any black dots in it, use your program to define the yellow you are using as 100% red and 100% green without any blue.

Watermark Tips

- When using a watermark, make sure the font that is in the watermark file is also in the Fonts folder inside your System Folder. If you give the watermark file to someone, they also need any fonts that it uses in order to use the watermark in their own documents.

Tips on Sharing Your Printer

- To avoid confusion, be sure to give each shared Color StyleWriter 2200 printer a unique name. If you have more than one printer with the same name in a single AppleTalk zone, the Chooser will display only one of them.
- To clean the print head of a shared Color StyleWriter 2200, you must send the request from the Macintosh that is directly connected to the printer.

Other Printing Tips

- If you see very thin stripes near the bottom of your printout, use your application program to make your bottom margin larger. A bottom margin of 0.8 inches or greater is best.
- For best results when printing envelopes, do not put images or text along the bottom edge of the envelope.
- If you are printing from a Quadra 800 and you get a message that the battery on the Color StyleWriter 2200 is low, be sure to click Okay and dismiss the dialog BEFORE replacing the discharged battery.

Printing With QuickDraw GX

..TIL19390-Color_StyleWriter_2200-v2-1-2_Readme_File_2-96_(TA35111).pdf

If you have QuickDraw GX on your system, the Color StyleWriter 2200 Installer will automatically install everything you need for printing with QuickDraw GX.

- If you installed QuickDraw GX after you set up your Color StyleWriter 2200, you must reinstall the Color StyleWriter 2200 software.
- After you click the Print button to print a complex document, you may notice a delay before you see printer activity.

If printing with QuickDraw GX doesn't produce satisfactory results, you can use the GX Helper utility to turn off QuickDraw GX and use the regular QuickDraw printing software. For more information, see Appendix E of your user manual.

Using the Color StyleWriter 2200 With Application Programs

If you have problems printing from a specific program, it may be a problem in that program. If you have problems, contact the publisher of the program. In some cases a newer, more compatible version of the software may be available.

- In some programs—such as Microsoft Word 5.1, WordPerfect 3.0, ClarisWorks 2.0, and Symantec GreatWorks 2.0—rotated text created within the program may print with jagged edges. For best results, create the rotated text in another program and paste it in.

Notes About Specific Programs

The following list describes some special situations that you should be aware of when working with specific programs. (There may be other problems with these programs or with other programs not mentioned in this document).

AdobeType Manager

- When you install version 3.8.1 or later of Adobe Type Manager, some system fonts are removed from your system and placed in a folder called "De-installed Fonts1." If you later turn off ATM, drag all the fonts in the "De-installed Fonts1" folder back into the Fonts folder inside the System folder to prevent characters with jagged edges.
- If you rotate Adobe Type 1 fonts in FreeHand 3.11 and then paste them into another program, your Macintosh will display a system error when you try to print.
- If you print rotated Adobe Type 1 fonts using FrameMaker 4.0, your Macintosh will display a system error.
- If you print rotated Adobe Type 1 fonts that are also bold or italic using Intellidraw, and text will not print, you probably need to upgrade to ATM version 3.8.1.
- If you get incorrect output when you try to print rotated and flipped Adobe Type 1 fonts, try using a TrueType font instead.

..TIL19390-Color_StyleWriter_2200-v2-1-2_Readme_File_2-96_(TA35111).pdf

- When Adobe Type 1 fonts are both outlined and underlined, characters may be misprinted (incorrect locations, multiple characters in same location, lower portions of characters shift left or right).

Adobe Dimensions

- Always print your documents in the foreground when using Adobe Dimensions. To turn background printing off, open the Chooser, click Off for Background Printing. If you accidentally print in background and your Macintosh crashes, you may have to restart with extensions off, open your desktop printer and drag all print requests from the queue.

Adobe Illustrator 5.0

- Unless you have at least 10 MB of free disk space on your startup disk, you will see a "disk is full" error message when you try to print. The more complex the document, the more space you need.
- If banding occurs in gradient fills, try printing with the Pattern halftoning option selected. (In the print dialog box, click the Color button, then select the Pattern option.)

Aldus PageMaker 5.0

- To see the Color StyleWriter 2200 Page Setup and Print dialog boxes, click the Setup button in PageMaker's Print dialog box.
- When printing rotated PICT or EPS images, be sure background printing is turned on in the Chooser. If you must print in the foreground, rotate the image in another program, then import it into PageMaker in the orientation in which you plan to print it.
- PageMaker 5.0 prints pages in reverse order on the Color StyleWriter 2200, which may be particularly confusing if you are using 2-up or 4-up printing. To print the first page first, turn on the Reverse Order option in the Print dialog box.

ClarisDraw 1.0v1

- If you have problems printing in the background, you may want to increase the Desktop PrintMonitor extension's preferred size to 300K (by using the Get Info command, as explained in the instructions that came with your Macintosh). The extension is located in the Extensions folder inside your System Folder.

ClarisImpact 1.0v1

- If you have problems printing ClarisImpact documents from a Power Macintosh, upgrade to ClarisImpact 1.0v3.

DeltaGraph Pro 2.0.3

- When printing charts, always click the QuickDraw button in the Print dialog box.

FrameMaker 4.0

- Some FrameMaker documents, including some the Concern.Doc sample document that comes with the program, will not print with version 3.8.1 of Adobe Type Manger. If you try to print a document and your system crashes, try printing again after turning off or removing the ATM software.
- If you import text as a graphic, you can crop it on the screen but it will print uncropped.
- Rotated text in large point sizes will print as a gray box. For best results, break up the text blocks into smaller pieces or individual characters.

MacDraw II 1.1 v2

- To print in color, be sure to turn on the Print Color Patterns in the Print Options dialog box and select Color in the Image pop-up menu in the Print dialog box.
- If you experience problems when printing your MacDraw II document with layout of 2-Up or 4-Up, try using a different program, like ClarisDraw.

Microsoft Excel 4.0 and Lotus 1-2-3

- To print in color, be sure to check the Print Using Color option in the Print dialog box and select Color in the Image pop-up menu.

Microsoft Excel 5.0

- If colored cell borders drop out when printing, try using yellow or brown or you can use the line tool in the Drawing tools palatte.
- When you choose the Page Setup command, you get Excel's own version of the Page Setup dialog box. Click the Options button to see the version of the dialog box with the special Color StyleWriter 2200 options.

Microsoft Word 6.0

- When you cancel a print request from MicroSoft Word 6.0, some of the document will still print. If you are using desktop printing, try stopping the print queue on your desktop printer and then removing the print request instead of cancelling. To do this, click on you desktop printer icon and select Stop Print Queue from the Printing menu.

Ofoto 2.0

- For best results, make a custom calibration for the Color StyleWriter 2200 and click the Custom Profile button.

The Print Shop v1.3.2

- To print in color, select ImageWriter in the Preferences dialog box.

Print Shop Deluxe 1.0

- Make sure you open your document before printing.

SoftWindows 1.0

- You may not be able to print to your Color StyleWriter 2200 from SoftWindows. Contact Insignia Solutions Inc. for more information on printing from SoftWindows.

Studio/8 v 2.0 and Studio/32 v 1.2

- Always click the QuickDraw button in the Print dialog box.

What are PowerBook Demo files? (2/96)

Revised: 2/22/96
Security: Everyone

What are PowerBook "Demo" files? (2/96)

=====

Article Created: 22 February 1996

TOPIC -----

A customer has installed the PowerBook 5300 Software Update and he is now noticing the following files in his Extensions folder:

Demo click&drag
Demo drag/lock
Demo single.click

What are these for, and why are they called "Demo"?

DISCUSSION -----

The "demo" files that the customer sees in his System Folder are QuickTime movies. They are used by AppleGuide to illustrate the functionality of the "clickable" Trackpad used in some PowerBook computers. They are only labelled "demo" because they demonstrate the operation of certain Trackpad features.

To see what the movies demonstrate, open them using MoviePlayer, or try the following:

Step 1

Go to the Finder and choose "Macintosh Guide" from the Help/Guide menu.

Step 2

Locate the word "Trackpad" in the index.

Step 3

Click on "How do I use the Trackpad to click and drag?" Click OK.

Step 4

Follow the instructions in the Guide window.

AppleVision Display Software: v1.0.1 & v1.0.2 Changes (5/96)

Revised: 5/21/96
Security: Everyone

AppleVision Display Software: v1.0.1 & v1.0.2 Changes (5/96)

=====

Article Created: 23 February 1996
Article Reviewed/Updated: 20 May 1996

TOPIC -----

This article contains the changes made between Version 1.0.1 and 1.0.2 of the AppleVision Display software.

DISCUSSION -----

AppleVision Display Software version 1.0.2 contains the following improvements:

- The 1.0.2 installer maintains compatibility with the next System Software Update.
- A driver conflict that caused some computers to restart during the startup process has been eliminated.
- To provide better support for computers with multiple monitors using Accurate Color settings, changes were made to the way the Accurate Color panel updates its pop-up menus and saved settings list.
- To shorten the startup process on computers running System Software 7.1.x, the AppleVision extension was renamed "°AppleVision."
- After recalibration in thousands or millions of colors and restarting the computer, Gamma settings will be saved correctly.
- To eliminate crashes caused by pressing the monitor's bezel buttons during startup, improved error handling has been implemented. However, pressing bezel buttons during startup is still not supported and may cause the software to fail to load correctly.

QuickTime Conferencing Web Installer: Read Me file (2/96)

Revised: 2/23/96
Security: Everyone

QuickTime Conferencing Web Installer: Read Me file (2/96)

=====

Article Created: 23 February 1996

TOPIC -----

This article contains the readme file included with the QuickTime Conferencing Web Installer available on the Internet and World Wide Web.

DISCUSSION -----

QuickTime Conferencing Web Installer

This installer will:

- Install free QuickTime Conferencing software for Internet and web use
- Upgrade existing QuickTime Conferencing users to a newer version of the software with enhanced Internet and QuickTime capabilities

With the QuickTime Conferencing Web Installer, you will be able to:

- Videoconference with Mac users around the world via TCP/IP on the Internet
- View live audio-video broadcasts on the worldwide internet
- Make calls or start watching broadcasts from a web page

The QuickTime Conferencing Web Installer installs:

- The QuickTime Conferencing system extensions (version 1.0.4)
- "QuickTime TV" application, for viewing Internet broadcasts
- "QuickTime Web Conference" application, for Internet videoconferencing
- "Conferencing Helper Application", which is used for:
 - launching live connections via the WWW
 - creating files which can launch live connections via the WWW
- QuickTime 2.1 and Sound Manager 3.1 with enhanced QuickTime sound codecs

This release of the QuickTime Conferencing Web Installer has some limitations: you will need bandwidth equal to or greater than (128 kbit/sec) to

videoconference or view live broadcasts, and connectivity is between Mac users only at this time.

Cross-platform support can be gained by purchasing the QuickTime Conferencing ISDN Kit, which supports videoconferencing with users on H.320 compatible Windows systems, or by purchasing the Apple Media Conference software application, which supports audioconferencing with Windows users on the Internet.

In addition, cross-platform and collaboration capabilities such as the shared whiteboard, drag and drop sharing of styled text, pictures and sounds, file transfer and more can be accomplished through purchase of third party or Apple based QuickTime Conferencing collaborative applications.

Basic System Requirements

- Power Macintosh or 68040 Macintosh computer
- System software version 7.5 or newer
- 16 Megabytes of memory
- Internet connection of 128 kbit/sec or more (for instance, T1 or basic rate ISDN)
- MacTCP and Network Software Installer version 1.5, or OpenTransport

Additional System Requirements (For QuickTime Web Conference)

- Video source (for instance, a video camera for A/V Macs or QuickCam for others)
- Sound source (for instance, a Plaintalk microphone)

Installing QuickTime Conferencing Software

Follow these steps to install the QuickTime Conferencing software.

- (1) If you are installing from the Internet web site, download the install package.
- (2) Locate the Web Conferencing Install folder and open it. Double-click the Installer icon located in the folder.
- (3) Read the message that appears, then click Continue.
- (4) If the installer tells you that you must run the Network Software Installer 1.5, download that and install it. Then repeat steps 2 & 3.
- (5) In the Easy Install dialog box, click Install. All the necessary software will be installed on your computer's hard disk.
- (6) When installation is complete, click Restart.

When you restart, you will find a new folder titled "QuickTime Conferencing" on your hard disk. This folder contains the broadcast viewing, conferencing and web browser helper application for QuickTime Conferencing Internet software. Also included is the QuickTime application MoviePlayer 2.1. Note that the QuickTime

Conferencing Web Installer will install QuickTime version 2.1 as well as a new QuickTime video compressor, H.261, which allows for conferencing at low bit rates. The H.261 compressor is a PowerPC native compressor. Any videoconference session in which all machines are PowerPCs, will use the H.261 compressor.

To Place a Videoconference Call to an Internet User

When using QuickTime Web Conference as a standalone application:

(1) Configure your MacTCP or OpenTransport TCP/IP control panel as your Internet Service Provider (ISP) recommends.

(2) Launch the "QuickTime Web Conference" application

(3) Select the menu item "Call" from the "File" menu.

(4) Type in the host name or IP address of the Internet user with whom you wish to videoconference and click on 'Connect'.

(5) The call will be placed via the Internet and an audio-video connection established

(This feature temporarily disabled for 1.0.4a4) During a connection, you can store a "QTC Calling Card" for a QuickTime Conferencing Internet user, by selecting the "Save Calling Card" menu item in the "File" menu. The next time you wish to call the user, you can select the "Speed Dial" option and select the QTC Calling Card for that user. You can also save a single QTC Calling Card, to represent a group of conferencing users. To do this, select the "Save Group Card" menu item. When you wish to re-establish a conference with the same participants, select the "Speed Dial" option, and then select the QTC Calling Card for the group of conferencing users.

Calls can be initiated from a web page. A URL to a QTC stored-address file (with a .qtc extension) can cause QuickTime Web Conference to launch, open the stored-address file, and attempt to make a connection to the address described in the file. The server and browser must both be properly configured for QTC; this process is described below.

To View an Internet Broadcast

When using QuickTime TV as a standalone application:

- Configure your MacTCP or OpenTransport TCP/IP control panel as your Internet Service Provider (ISP) recommends.

- Launch the "QuickTime TV" application

- Select the menu item "Watch Broadcast" from the "File" menu.

- Type in the domain name or ip address of the Internet live broadcast you wish to watch

- The broadcast will be viewed via the internet

(This feature temporarily disabled for 1.0.4a4) While viewing a broadcast, you can store a "QTC Calling Card" for a QuickTime Conferencing Internet user, by selecting the "Save Calling Card" menu item in the "File" menu. The next time you wish to view the broadcast you can select the "Speed Dial" option and select the QTC Calling Card for that broadcast. You can also save a single QTC Calling Card, to represent a group of broadcasts. To do this, select the "Save Group Card" menu item. When you wish to re-establish a session with the same set of broadcasts, select the "Speed Dial" option, and then select the QTC Calling Card for the group of broadcasts.

Watching a broadcast can be initiated from a web page. A URL to a QTC stored-address file (with a .qtc extension) can cause QuickTime Web Conference to launch, open the stored-address file (a "calling card"), and attempt to make a connection to the address described in the file. The server and browser must both be properly configured for QTC; this process is described below.

Configuring a Web Browser for QuickTime Conferencing Calling Cards

Netscape 2.0b4 and later comes pre-configured for QTC.

To configure other web browsers so that they may view live broadcasts and connect to other users for videoconferences on the Internet, follow the steps listed below:

In general, for any web browser,:

(1) Install the "Conferencing Helper Application" as the Helper Application for the Mime Type "video/x-qtc", with the file extension ".qtc".

Specifically for Netscape (versions 1.1 through 2.0b3), follow the directions below:

- From the Netscape Options menu, choose General Preferences. The Preferences panel opens, showing a variety of preferences to select.

- Choose the panel in preferences which says "Helpers". The window changes to show the Helper Applications settings.

- Type in the Mime type "video"

- Type in the Mime sub-type "x-qtc"

- Type in the extension ".qtc"

- Set the "Action" to launch application.

- Click on "Browse", and then a file directory pop-up is displayed. Browse through your directories, and select the "Conferencing Helper Application" in the local "QuickTime Conferencing" folder on your hard disk. When you are done with this step, the "Conferencing Helper Application" will be displayed as the helper application for the Mime type "video/x-qtc" with action "Launch" and

extension ".qtc".

- Close the preferences panel of Netscape, and close the application. When you restart Netscape, you will now be able to launch the appropriate QuickTime Conferencing application to view live broadcasts and make video conference connections to other users, after restarting Netscape.

Configuring a Web Server for QuickTime Conferencing Calling Cards

The following steps will result in the creation and usage of a file which can be used from within HTML to reference a QuickTime Conferencing broadcast or videoconference connection.

(This feature temporarily disabled for 1.0.4a4)

1) The first step is to create a QTC "calling card" which can be referenced from HTML:

- Establish a QuickTime Conferencing connection (live broadcast viewing or a videoconference session) using an existing QTC application, such as QuickTime TV, QuickTime Web Conference (version 1.0.3) or Apple Media Conference (version 1.1).

- Save a reference to the connection (conferencing user or live broadcast) by selecting "Save Calling Card" in QuickTime TV or QuickTime Web Conference. You can save a reference to a set of connections by selecting "Save Group Card" in QuickTime TV or QuickTime Web Conference.

- Launch the Conferencing Helper Application included with the Conferencing Web Installer.

- Convert the QTC calling card (typically found in System Folder/Preferences/QTC Calling Cards) using the "Convert Calling Card" menu item in the Conferencing Helper Application. The file will be converted to a data fork only file format, which can be stored on Macintoshes, PCs and UNIX-based web servers.

2) The second step is to transfer the selected QTC calling card to the web server.

3) The third and final step is to configure the web server so that it is aware of the QuickTime Conferencing MIME type.

To configure your Web browser so that web pages can reference QuickTime Conferencing connections, you will typically need to add a line to the list of supported MIME types for the web server. For web server configuration files, where the configuration is specified as:

```
<type> <suffix> <mac file type> <mac creator> <mime type>
```

add the following line, so that QuickTime Conferencing connections referenced via HTML will be supported at the web server:

```
BINARY .QTC .qtc * video/x-qtc
```

The configuration file command may be different for various HTTP web servers, but this example should serve as a useful guideline.

QuickTime Conferencing and Firewalls

At those sites with Internet firewalls, it may be necessary to configure the firewall so that QuickTime Conferencing applications can use certain features.

- To allow incoming QuickTime Conferencing calls to be received at an Internet site, it is necessary to allow incoming TCP traffic on port 458.
- To allow outgoing QuickTime Conferencing calls at an Internet site, it is necessary to permit outgoing TCP traffic on port 458.
- To allow QuickTime Conferencing broadcasts to be transmitted from an Internet site, it is necessary to allow incoming and outgoing TCP traffic on port 545.
- To allow QuickTime Conferencing media streams to flow outwards through the firewall, UDP traffic with static port 458 and with dynamic port values greater than or equal to 7000 must be allowed outgoing.
- To allow QuickTime Conferencing media streams to flow in through the firewall, UDP traffic with static port 458 and with dynamic port values greater than or equal to 7000 must be allowed incoming.

Printers: Paper Weight Conversions (2/96)

Revised: 2/23/96
Security: Everyone

Printers: Paper Weight Conversions (2/96)

=====

Article Created: 23 February 1996

TOPIC -----

How do I convert a paper weight of grams/meter² (g/m²) to Lbs? My ream of paper says 75 grams/meter².

DISCUSSION -----

The international weight of paper is measured in grams/meter² (g/m²), to convert this to the U.S. standard measurement of pounds (Lbs), use this formula:

$$.2667 \times \text{g/m}^2 = \text{Lbs}$$

Examples:

$$.2667 \times 75 = 20.0025 = 20 \text{ lb}$$

$$.2667 \times 90 = 24.003 = 24 \text{ lb}$$

$$.2667 \times 60 = 16.002 = 16 \text{ lb}$$

Convert from Lbs to g/m²

$$\text{Lbs} / .2667 = \text{g/m}^2$$

Example

$$28 / .2667 = 104.99 = 105 \text{ g/m}^2$$

Network Server: AIX and Application Binary Compatibility (6/96)

Revised: 6/24/96
Security: Everyone

Network Server: AIX and Application Binary Compatibility (6/96)

=====

Article Created: 26 February 1996
Article Reviewed/Updated: 24 June 1996

TOPIC -----

This article will provide a brief introduction to Network Server hardware running IBM's AIX 4.1.4 operating system, and will discuss hardware and software considerations relating to application binary compatibility.

DISCUSSION -----

Most of the thousands of AIX 4.1 applications running today on IBM's RS/6000 platform should run on the Network Server AIX 4.1.4 without any modification. Exceptions include those applications with specific hardware dependencies, and applications which do not yet run on AIX 4.1 due to incompatibilities between IBM's implementation of AIX 4.1 and previous releases of AIX.

IBM's AIX 4.1 represents a state of the art UNIX operating system adhering to accepted industry standards including IEEE POSIX, FIPS 151-2, and XPG4. AIX 4.1 is also designed to meet the emerging common application interface as defined by Specification 1170. AIX features supported include:

- JFS (Journaled File System) with mirroring and striping.
- UNIX networking including NFS, TCP/IP.
- Common Desktop Environment (industry standard UNIX GUI).
- System Management Interface Tool and Visual System Manager.

Network Server with AIX 4.1.4

=====

Apple will provide the AIX 4.1.4 operating system running on high-performance hardware custom-designed to be a greater server platform. AIX 4.1.4 provides a high-performance base operating system on which to run higher-level services such as file, print, and database. Additional Apple value-added features required by our customers will also be provided. To meet these needs, the

Network Server integrates a number of complex technologies, from several different sources.

- PowerPC RISC processor technology from IBM, Motorola, and Apple.
- IBM's AIX 4.1.4 including UNIX networking and AIX Windows (X and Motif)
- Berkeley-style sockets and TLI-compliant AppleTalk protocol stack, with router functionality and support for multiple Ethernet interfaces.
- Third-party solutions such as RAID and file/print services.

Considerations for Binary Compatibility

=====

Binary compatibility means that a compiled program (the executable) can be taken from one platform to another without having to either recompile it, or make source code changes.

Most applications will be binary compatible with AIX 4.1.4 running on the Network Server because in most cases, differences in hardware that may affect binary compatibility are masked by the operating system environment, and are not visible to the applications layer. In order to ensure application binary compatibility, Apple has been working with different ISVs.

Application Binary Interface (ABI)

The IBM AIX 4.1 ABI defines all the elements developers need to create applications that will install, execute, and run unmodified on AIX 4.1. This includes such key definitions as loading and linking, conventions, object formats, the execution environment, networking infrastructure, and installation and packaging information. The core of this definition will consist of the IBM AIX 4.1 interfaces. Apple will add some additional interfaces to it's value added subsystems (that is AppleTalk) and will by necessity have to delete interfaces that support IBM-specific hardware.

For UNIX users, the AIX 4.1 ABI will provide platform binary compatibility based upon leading edge hardware technology and software specifications. The AIX 4.1 ABI specification enables binary applications to run across AIX systems from different vendors, and to provide a standards-driven, open environment for tomorrows users today. Applications developed to the AIX 4.1 ABI should run unmodified on Network Server AIX 4.1.4.

Application Programing Interface (API)

The API defines the set of system calls, library functions, header files, commands and utilities that an application developer is allowed to use to develop a compliant application. ISVs are mainly concerned with programming to the API. Underlying the Network Server AIX 4.1.4 API are key industry standards including:

- X/Open XPG4
- X/Open XNFS
- X/Open XTI
- X Window System (X11R5)

- OSF AES (Open Software Foundation Application Environment Specification)
- IEEE POSIX

Available AIX Applications

=====

There are about 3,000 AIX 4.1 applications listed in IBM's "AIX Power Solutions" catalogue, which can be ordered from IBM, Document No. GC67-0210-04. AIX applications listings are also available on the World-Wide Web, the top level URL is:

<http://www.mfi.com/softwareguide/AIX-Solutions/>

IBM has stated that more than 10,000 applications have been developed for AIX since it was introduced in 1990. AIX was first ported to the PowerPC by IBM in 1993 in a release of AIX 3.2.5. Most AIX 3.2.5 applications will run on AIX 4.1 and will also be binary compatible with the Network Server. IBM has an AIX V4 Certification Program to help developers certify that their AIX 3.2 solutions run on AIX 4.1.

Apple is in the process of testing the AIX binary compatibility of the Network Server platform and will provide more specific information as it becomes available.

Applications that are not Binary Compatible with Network Server AIX 4.1.4

=====

The ability to take a compiled program (the executable) from one platform to another and run it without having to make any source code changes is affected by many things. Certain applications may need some modification if they are affected by any of the following:

The processor and the expansion bus

The Network Server platform uses the PowerPC 604 microprocessor, which does not implement all of the instructions in the original POWER chipset or the POWER2 architecture. If an application uses hard-coded assembly or compiler options which result in instructions which are not implemented on the PowerPC 604, then the binary may not run on the Network Server platform. The operating system attempts to mitigate this problem by emulating many of the unimplemented instructions.

The Network Server platform's principal hardware incompatibility as compared with the existing base of AIX applications is its exclusive use of the PCI expansion bus. Almost all of the current AIX platforms from other vendors use IBM's MicroChannel Architecture (MCA) expansion bus or provided both MCA and PCI buses. If an application depends on a specific MCA expansion card such as a multi-port serial card or Centronics printer, then a functionally equivalent PCI card (and supporting AIX driver software) may not be available. Apple believes the PCI expansion bus is becoming widely adopted and is working with third-parties to promote the availability of PCI cards and drivers for the

Network Server platform.

The system API, including device drivers interfaces and kernel extensions

For example, Apple has adopted the Open Firmware model to support PCI card self-configuration on Network Server and future desktop platforms. Device driver writers will need to develop Open Firmware-based configuration methods to correctly invoke their drivers on the Network Server platform. Apple is creating an addendum to the AIX Device Driver's Guide which describes these relevant Open Firmware issues.

The libraries, commands and other system utilities

In AIX 4.1, the Korn shell, /bin/ksh, is linked to /bin/sh, which is traditionally the Bourne shell. If an application uses a Bourne shell script which is incompatible with the Korn Shell, the procedures would not perform correctly on AIX 4.1. Most Bourne shell scripts are compatible with the Korn shell, however.

In addition, IBM reports in the "AIX Version 4.1 Porting Guide" that some applications will run on AIX 3.2.5, but not AIX 4.1; some of the problematic system services are listed below:

- XPG4 changed command output formats
- Unsupported loadable AIX kernel extensions
- Certain high-function terminal APIs
- IBM X input device programming interfaces instead of the X11R5 standard input interfaces
- Communications I/O LAN device driver programming interface
- SCSI device configuration methods (IHVs)
- nlist () interface
- DCE threads

The resulting incompatibilities for the list above are not unique to Apple's AIX implementation but are due to incompatibilities between IBM implementation of AIX 3.2.5 and 4.1.

There are other factors affecting the availability of binary compatible applications for the Network Server AIX product. These include:

- Availability of ABI test suites
- Third-party (ISV) application testing and certification
- Performance tuning considerations
- Third-party marketing efforts (sales training, technical support)
- Support for third-party applications

Macintosh Applications

Macintosh applications are not supported as the Macintosh Application Environment (MAE) is not supported on AIX.

Performa & TelePort Gold II Modem: How It Draws Power (2/96)

Revised: 2/27/96
Security: Everyone

Performa & TelePort Gold II Modem: How It Draws Power (2/96)

Article Created: 26 February 1996
Article Reviewed/Updated: 27 February 1996

TOPIC -----

I have a Macintosh Performa 6112CD which includes a Global Village TelePort Gold II modem. I want to use the modem with another Macintosh computer. How can I do this?

DISCUSSION -----

The Global Village TelePort Gold II modem draws power from the ninth pin on the serial connector. So, you cannot use this modem with a Macintosh which does not provide this type of serial port. Additionally, there are no solutions available to convert the Global Village TelePort Gold II modems to use an external power supply or ADB port as its power source. If you are using a Macintosh computer that does not provide this type of serial port, then you need to purchase another modem.

Alternatively, if the two computers are connected to each other in a network, you may be able to use third-party software that allows a modem to be shared across a network.

Why Does Clip Art Print Out Jagged? (2/96)

Revised: 2/26/96
Security: Everyone

Why Does Clip Art Print Out Jagged? (2/96)

=====

Article Created: 26 February 1996

TOPIC -----

Why is it that some clip art I have prints smoothly, while some has jagged edges?

DISCUSSION -----

There are two types of graphics formats used on personal computers: bitmapped and vector (or object-oriented) graphics.

Bitmapped graphics

Bitmapped graphics are a matrix of picture elements (called pixels), each one of which has a color assigned to it. The collection of these elements define what an image looks like. Since it is a matrix, the image you look at does not have any inherent properties which define its characteristics. For example, a "line" is a collection of dots, rather than a solid line.

If the image is scaled or magnified, the dots will become more visible. Considering that your screen has a resolution of about 72 dots per inch, and even low-end printers have 300 dots per inch, it is more likely that you will see such "pixellation," especially if color information is lost as part of the printing process.

In Macintosh terminology, MacPaint, TIFF, GIF, or JPEG images are bitmapped graphics, so you can expect to see some pixellation when you print. Exceptions would be pixmaps which are imaged at extremely high resolution--resolutions which equal or exceed your printer's resolution. You will find it easy to spot these because they tend to be several megabytes in size.

Vector images

Vector images are object-oriented collections of geometrically defined elements. For example, a line really is a line--an object which consists of information

specifying its start and end coordinates, color, width, and other characteristics. Similarly, text just consists of the string information to draw and some font information. The dots that comprise the letters are not stored.

A picture comprised of vector elements can be scaled to any size, and the resulting output will be very smooth and will generally contain the characteristics of the original image.

On your Macintosh, vector formats include PICT, EPSF, and PostScript.

Conclusion

There are literally hundreds of file formats in use in the Macintosh, UNIX, and PC worlds. However, the basic limitations above apply, and many programs allow graphics to be imported from similar formats.

So, to avoid bitmapped printouts of your clip art, you need to obtain clip art which consists primarily of vector graphics. Most PICT-based packages would satisfy that requirement, but you should check with the publisher to verify this. If the PICT image is solely defined of one big bitmap, you will get pixellation.

Network Server: AIX System Dumps (2/96)

Revised: 2/26/96
Security: Everyone

Network Server: AIX System Dumps (2/96)

Article Created: 26 February 1996

TOPIC -----

This article describes AIX system dumps on the Network Server 500 and Network Server 700.

DISCUSSION -----

AIX generates a "system dump" when a severe error occurs, such as a kernel panic or hardware failure. Users with root privileges can initiate system dumps as well. A system dump creates a picture of your system's memory contents. System administrators and programmers can generate a dump and analyze its contents when debugging new applications, device drivers, and other kernel extensions. In addition, a system dump may be initiated from the keyboard when the keyswitch is in the service position, using the key sequence CTRL-Option-NumPad1. This may be useful when the system appears to be hung (of course, the system must be responsive enough to handle keyboard input).

If your system stops with an "888" number flashing in the LCD display, the system has generated a dump and saved it to a dump device. Your dump device holds the information that a system dump generates, whether generated by a system or a user. You can copy this information to tape and deliver the data to your service provider for analysis.

NOTE: The system cannot recover from a dump. You must restart the server after a dump has been taken.

Dump Device Configuration

By default, the system dump will be placed on the system paging space, /dev/hd6. You can check the dump settings by using the command "sysdumpdev". The following are the default settings:

```
# sysdumpdev -l  
primary          /dev/hd6
```

```
secondary          /dev/sysdumpnull
copy directory      /var/adm/ras
forced copy flag    TRUE
always allow dump   FALSE
```

It is not recommend, but you can change the dump device and other designations using the "sysdumpdev" command. Since a system dump may occur at any time, any other dump device must be dedicated to this purpose. The system paging space is an ideal dump device -- it will not be needed after the dump takes place, yet the space is still available for the system to use at other times. System installation should correctly configure the size of the paging space to be at lease as large as system memory (since the system dump is a snapshot of system memory this is the worst case scenario). To check the size of the system paging space, execute the following command:

```
# lsps -s
Total Paging Space      Percent Used
      128MB              27%
```

You can get an estimate of the system dump size using the -e option to sysdumpdev.

NOTE: You cannot permanently set the dump device to a logical volume not in the rootvg volume group. During boot time, when the dump device is configured, only the root volume group is accessible.

System Dump Recovery

When a system dump is taking place, status codes are displayed in the LCD display -- see Status Codes below. When the dump is complete, a 0c0 status code displays if the dump was user-initiated, a flashing 888 displays if the dump was system initiated. After the dump is complete, the system halts. You must restart the system to recover the data from the dump device. During system startup, the dump data will be copied to a filesystem specified by the copy directory, by default /var/adm/ras; the filename will be "vmcore.#", where # increases with the number of active dumps.

If there is insufficient space in the designed filesystem, the system will prompt you for removable media (such as a tape drive) on which to copy the dump data. After system startup has completed, copy the dump from the external media to a filesystem which has sufficient free space. Enter the following to copy the dump from /dev/rmt0, the default tape device.

```
# tar -x
```

After rebooting in normal mode and coping the system dump from tape if necessary, use the snap command to copy the dump data and other system configuration information to a blank tape for delivery to your service provider.

```
# snap -gfkD -o /dev/rmt0
```

If you recovered the system dump from tape, you must now append the dump data to

the tar archive created by the snap command. The snap command will have failed to find the dump data in the copy directory.

```
# tar -r dump_file
```

NOTE: The AIX documentation describes two uses of the reset button related to system dumps which do not apply to Apple hardware. On some IBM systems, if the keyswitch is in the service position, the user may initiate a system dump by pressing the reset button. After a system-initiated dump, on some IBM systems, the user may access additional status codes by repeatedly pressing the reset button.

NOTE: If the dump fails and upon reboot you see an error log entry with the label "DSI_PROC" or "ISI_PROC", and the Detailed Data area shows an "EXVAL" of "00000005", this is probably a paging space I/O error. If the paging space is the dump device or on the same hard drive as the dump device, your dump may have failed due to a problem with that hard drive. You should run diagnostics against that disk.

NOTE: AIX supports designating a tape device as the primary dump device, but that capability does not currently work on the Apple Network Server.

System Dump LCD Status Codes

The system LCD may display the following three-digit codes during a system dump.

- 0c0 The dump completed successfully. Send the dump data to your service provider
- 0c2 A system-initiated or user-requested dump is not finished. Wait one minute for the dump to complete and for the operator panel display value to change. If the operator panel display value changes, find the new value on this list. If the value does not change, then the dump did not complete due to an unexpected error. Report the problem to your service provider.
- 0c3 The dump is inhibited.
- 0c4 the dump did not complete successfully. A partial dump was written to the dump device, but there is not enough space on the dump device to contain the entire dump. To prevent this problem from occurring again, you must increase the size of your dump device.
- 0c5 A system-initiated or user-requested dump did not complete. Wait one minute for the dump to complete and for the operator panel display value to change. If the operator panel display value changes, find the new value on the list. If the value does not change, then the dump did not complete due to an unexpected error. Report the problem to your service provider.
- 0c7 A network dump is in progress, and the host is waiting for the server to respond. the value in the operator panel display should alternate

between 0c7 and 0c2 or 0c9. If the value does not change, then the dump did not complete due to an unexpected error. Report the problem to your service provider.

0c8 The dump device has been disabled. The current system configuration does not designate a device for the requested dump. Use the sysdumpdev command to configure the dump device.

0c9 A dump started by the system did not complete. Wait one minute for the dump to complete and for the operator panel display value to change. If the operator panel display value changes, find the new value on this list. If the value does not change, then the dump did not complete due to an unexpected error.

Global Village Modems: Initialization String for MacInTax (2/96)

Revised: 2/27/96
Security: Everyone

Global Village Modems: Initialization String for MacInTax (2/96)

=====

Article Created: 27 February 1996

TOPIC -----

This article provides an initialization string for users of the Global Village modems using GlobalFax 2.5.6 and wanting to use the electronic filing options in Intuit Software's 1995 version of MacInTax.

DISCUSSION -----

You must change the Global Village initialization string if you use the electronic filing option in MacInTax. If you do not change the initialization string, the modem connects but does not send any data.

Workaround

=====

Teleport Bronze II and Teleport Platinum

Initialization string: AT&C0&D2X1

Teleport Gold II

- 1) Start-up with extensions OFF
- 2) Use this Initialization string: AT&F1\N0

PowerBook 5300: PowerBook Tour Has Poor Sound Quality (2/96)

Revised: 2/27/96
Security: Everyone

PowerBook 5300: PowerBook Tour Has Poor Sound Quality (2/96)

=====

Article Created: 27 February 1996

TOPIC -----

Why is the PowerBook 5300 Tour sound quality so poor? I just got my Macintosh PowerBook 5300 series computer (with 8 MB of RAM) and have not changed any settings or installed any software yet.

DISCUSSION -----

PowerBook 5300 Tour Sound

=====

The sound quality of the PowerBook 5300 Tour application may be improved by turning off Virtual Memory. Follow these steps to do this:

Step 1

Pull down the Apple menu and select Control Panels.

Step 2

Open the Memory control panel.

Step 3

Turn off Virtual Memory.

Step 4

Select Restart the from the Special menu.

Step 5

Double-click on the PowerBook 5300 Tour application icon to start the tour.

When the tour is finished or you decide to quit, you may want to turn Virtual Memory back on so that you have enough memory available to open other applications.

Why Virtual Memory Is On =====

Macintosh PowerBook 5300 series computers that come with the minimum configuration of 8 MB of RAM ship with Virtual Memory turned on for your convenience. Many popular applications (the Microsoft Office suite, for example) may require a significant amount of RAM to run. If Virtual Memory was not enabled when the PowerBook shipped, many common applications may not have enough RAM to launch.

GlobalFax: Disable 14.4 kbps Faxing in Send Fax Setup (2/96)

Revised: 2/28/96
Security: Everyone

GlobalFax: Disable 14.4 kbps Faxing in Send Fax Setup (2/96)

Article Created: 28 February 1996

TOPIC -----

I am trying to make the Disable 14.4 Faxing setting in the Global Village Send Fax Setup, the retained setting whenever I restart my computer. I have testing various computers (Performa 630, 5200, 6200, 5300CD, and 6300CD) with System 7.5.1, and either GlobalFax 2.5.5, GlobalFax 2.5.4p, GlobalFax 2.5.5p, or GlobalFax 2.5.6p.

I have tried a variety of options to find a workaround, involving the following:

- Throwing the GlobalFax Prefs and Queue Temp File in the trash
- Using Extensions Manager and starting only System 7.5 and Global Village software
- Reinstalling all Global Village software
- Zapping PRAM and rebuilding the desktop
- Running Disk First Aid
- Doing a clean installation of System and Global Village software
- Re-initializing the hard disk and restoring all software from the Performa CD-ROM disc
- Restarting with just GlobalFax, Global Village Toolbox, and Teleport in the extensions and control panel folders.

Why can I not make the Disable 14.4 Faxing setting be maintained through the restart cycle?

DISCUSSION -----

We contacted Global Village, and they have acknowledged this issue. They were unable to commit to when this will be fixed.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for

additional information.

The following computers are in the Macintosh 630CD family: LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640.

The following computers are in the Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

The following computers are in the Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

AppleShare Client 3.6.1: Speed Copy 1.1 Compatible Issue (2/96)

=====

Article Created: 28 February 1996

TOPIC -----

On Connectix Corporation's World Wide Web site is a patch called AppleShare 3.6.x Patch. The documentation indicates this patch is posted to correct a compatibility issue with AppleShare Workstation v3.6.1 and Speed Copy 1.1.

Is this Connectix patcher modifying Apple code, an extension which can be removed, or modifying Speed Copy? This may cause a problem when troubleshooting, if Apple code is modified, because it will be difficult to set a computer to only Apple extensions and control panels.

DISCUSSION -----

The Connectix patcher is an extension and Read Me, and we were told, is needed for Speed Copy to work specifically with AppleShare Workstation v3.6.1. This patcher corrects a issue with files being corrupted during copy operations.

The patch is an extension that fixes the AppleShare Workstation 3.6.1 software in RAM by disabling the read and write caches. This results in performance loss when coping files to or from an AppleShare 4.2.x file server.

AppleShare Workstation v3.6.1 client software will be included in the next release of System System and System 7.5 Update 2.0, so this compatibility issue will be around for a while. This patcher is not expected to be required for AppleShare Workstation v3.6.2 which is included with the Workgroup Server 7250 and 8550 computers.

What Is ISDN (3/96)

Revised: 3/5/96
Security: Everyone

What Is ISDN (3/96)

=====

Article Created: 5 March 1996

TOPIC -----

This article describes Integrated Services Digital Network (ISDN).

DISCUSSION -----

ISDN (Integrated Services Digital Network) is an international network, like a telephone network, that supports rapid data transmission between many different types of personal communications devices, such as telephones, computers, and fax machines. With an ISDN line, you can send and receive both voice and other data, for example pictures, text, or video images simultaneously, at speeds up to 64 kilobits per second (kbps), per B (bearer) channel.

A typical ISDN line consists of two B channels and one D (signaling) channel which makes a BRI (Basic Rate Interface) ISDN line. The B channels are either 56 kbps, or 64 kbps, depending on the telephone company's equipment, and the D channel is 16 kbps. The total bandwidth for a BRI ISDN line is 144 kbps, however, the B channels are actually used for data and/or voice resulting in a bandwidth of 112 or 128 kbps.

The B channels can also be bonded together. Bonding refers to strapping the two B channels together using inverse multiplexing to produce what appears to be one 112 or 128 kbps channel.

Another type of ISDN line, has 23 B channels and one D channel, is the PRI (Primary Rate Interface) which is equivalent to a T1 line. Typically a PRI would be used by large corporations or an internet service provider.

QuickTime Conferencing ISDN Kit: NT-1 Needed (3/96)

Revised: 3/6/96
Security: Everyone

QuickTime Conferencing ISDN Kit: NT-1 Needed (3/96)

Article Created: 6 March 1996

TOPIC -----

This article describes why an NT-1 is needed for an BRI (Basic Rate Interface) ISDN connection, and where to get one.

DISCUSSION -----

Apple's QuickTime Conferencing ISDN Kit does NOT contain an NT-1 (Network Terminal Adaptor) which terminates the ISDN line at the users end, and powers the ISDN line from the Network Interface box to the ISDN device. An NT-1 is needed for a BRI ISDN connection which has two B channels and one D channel.

Users will need to purchase an NT-1. Their cost may run in the \$150 to \$400 range depending on features, like Caller ID and so on. A basic NT-1, without Caller ID, will do the job as well as the best model.

An NT-1 is easily obtainable. Your local telephone provider may offer to sell you one, or you can purchase one from the following companies:

Companies	Phone Number	Model Name
Quicomm	1-800-244-3688	NT-1 Network Terminator
Intellicom	1-800-884-ISDN	Various models
PicturePhone Direct	1-800-810-9966	Tone Commander NT1U-220TC

NOTE: Because an ISDN line needs power and would be unusable in the event of a power outage, a user might also consider connecting the NT-1 to a UPS (Uninterruptable Power Supply).

ISDN: How to Connect an NT-1 (7/96)

Revised: 7/1/96
Security: Everyone

ISDN: How to Connect an NT-1 (7/96)

Article Created: 6 March 1996
Article Reviewed/Updated: 1 July 1996

TOPIC -----

This article describes how to connect an NT-1 (Network Terminal Adaptor) to an ISDN line.

DISCUSSION -----

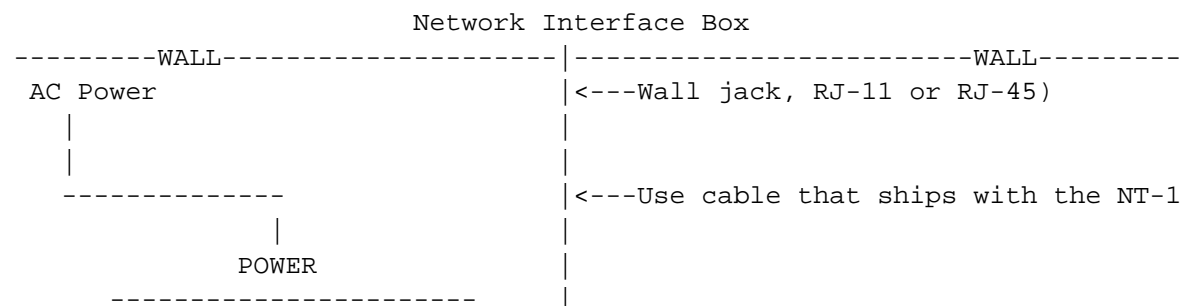

In most ISDN (Integrated Services Digital Network) installations, an NT-1 must be connected to the ISDN line to power the ISDN line from the Network Interface box to the ISDN device. Check with your telephone provider to see if one is needed.

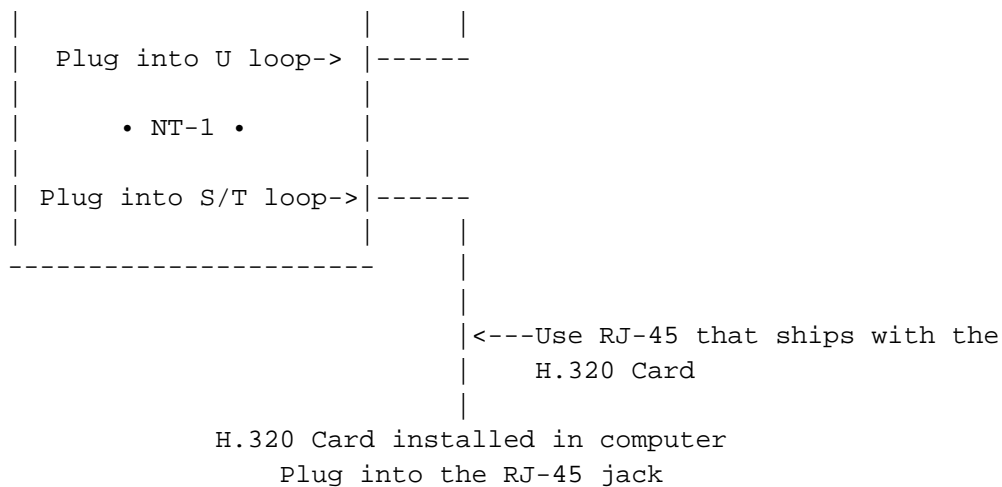

The NT-1 also has lights indicating the state of the ISDN line. Typically, an NT-1 will have Power, U Loop Back, and S/T&U lights.

Also because an ISDN line needs power and would be unusable in the event of a power outage, a user might want to consider connecting the NT-1 to an UPS (Uninterruptable Power Supply).

Below is a diagram showing how to connect an NT-1. An NT-1 may have multiple S/T ports, it does not make a difference which port you use.

ISDN: Troubleshooting Using NT-1 Lights (3/96)

Revised: 3/6/96
Security: Everyone

ISDN: Troubleshooting Using NT-1 Lights (3/96)

=====

Article Created: 6 March 1996

TOPIC -----

This article provides a table to help troubleshoot NT-1 (Network Terminator) issues using the its lights.

DISCUSSION -----

The NT-1 on an ISDN line typically has lights for power, U Loop Back, and S/T&U. These lights can be used to troubleshoot your ISDN line. Below is a table showing varying NT-1 light states:

Begin_Table

Normal Light States

=====

Light	State	Reason	Check
-----	-----	-----	-----
Power	On	Power is on	N/A
U Loop Back	Off	Line isn't being tested	N/A
S/T&U	Off	Line is ready for use	N/A

Other Light States

=====

Light	State	Reason	Check
-----	-----	-----	-----
Power	Off	There is no AC power	Power cord, AC wall jack.
U Loop Back	On/blinking	Line is being tested	Contact local phone company to see if line is actually

being tested.

S/T&U	Fast blinking (many blinks/sec)	Line is attempting to communicate with central office	If light then goes out, the line is ready to be used. If the light stays on, then check both cables coming out of the NT-1. If the problem continues, contact your phone company.
S/T&U	On steady	Line is not hooked up properly	Check cable going from wall jack to the NT-1.
S/T&U	Slow blinking (1 blink/sec)	Line is not hooked up properly	Check cable going from NT-1 to the ISDN device.

End_Table

ISDN: Who To Contact For ISDN Service (3/96)

Revised: 3/6/96
Security: Everyone

ISDN: Who To Contact For ISDN Service (3/96)

Article Created: 6 Mar 1996

TOPIC -----

This article provides telephone company contact information for ISDN service.

DISCUSSION -----

ISDN service should be obtained from your local telephone provider. Below are telephone numbers for many of the telephone companies across the United States. Call the number corresponding to your local telephone provider.

NOTE: ISDN service is NOT available in all areas of the United States. Typically, you must be within about three miles of the central office equipment, so check with you telephone provider for more details.

Telephone Company Contact Information For ISDN Service

- Ameritech: 800-832-6328 (800-TEAM-DATA)
- Bell Atlantic: 800-570-4736 (800-570-ISDN)
- Bell South: 800-858-9413
- Cincinnati Bell: 513-566-3282 (513-566-DATA)
- GTE:
 - Menu driven information service: 800-4GTE-SW5
 - Florida, North Carolina, Virginia, and Kentucky: 800-483-5200
 - Illinois, Indiana, Ohio, and Pennsylvania: 800-483-5600
 - Oregon and Washington: 800-483-5100
 - California: 800-483-5000
 - Hawaii: 800-643-4411
 - Texas: 800-483-5400

- Nevada Bell: 702-688-7124
- NYNEX: 800-438-4736 (800-GET-ISDN)
- Pacific Bell
ISDN Service Center: 800-472-4736 (800-4PB-ISDN)
ISDN Availability Hotline: 800-995-0346
ISDN Telemarketing (order information): 800-662-0735

Apple Adoption of Open Transport 1.1 - Q & A (3/96)

Revised: 3/8/96
Security: Everyone

Apple Adoption of Open Transport 1.1 - Q & A (3/96)

=====

Article Created: 4 March 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on Apple adoption of Open Transport 1.1.

DISCUSSION -----

Question: When will Open Transport become part of Mac OS?

Answer: Open Transport is included as a standard component of the Mac OS beginning with System 7.5.3 (System 7.5 System Update 2.0).

Open Transport v2.0 is being developed as an integral part of the Copland OS release; support is planned for all Copland platforms, including the PowerPC Platform (formerly CHRP).

Question: What Apple products will support Open Transport? Will these also be native on Power Macintosh?

Answer: Apple includes or plans to include support for Open Transport in the following products, as well many other unannounced products:

- Apple Remote Access 3.0
- MacSNMP 1.5
- Copland release of Mac OS

Open Transport 1.1: Applications Compatibility Q & A (2/97)

Revised: 2/6/97
Security: Everyone

Open Transport 1.1: Applications Compatibility Q & A (2/97)

=====

Article Created: 4 March 1996
Article Reviewed/Updated: 6 February 1997

TOPIC -----

This article is the Reference Q & A (questions and answers) on applications compatibility for Open Transport 1.1.

DISCUSSION -----

Question: Is Open Transport compatible with existing applications and network extensions?

Answer: Apple and third party developers have announced hundreds of Open Transport compatible applications.

Open Transport includes software libraries that provide "backward compatibility" services in four areas:

- to support existing applications that utilize the documented AppleTalk APIs;
- to support existing applications that utilize the documented MacTCP APIs;
- to support MacTCP Link Access Extensions (mdevs) on case by case basis; and,
- to support existing NuBus based network interface cards and drivers.

Note that the WinSock compatibility services are provided through third party software, available from NetManage. For more information, please refer to Open Transport and Cross-Platform Issues.

Open Transport compatibility services are available to applications accelerated for PowerPC as well as for 680x0 applications, as it provides the necessary "mixed-mode glue" as part of the Software Developer's Kit (SDK).

Question: What is implied when an application is "Open Transport Compatible"? Does that mean that it takes advantage of new Open Transport features?

Answer: Apple has defined three levels of interoperability with Open Transport. The first -- known as Open Transport Compatible -- is used to describe a network application originally developed for "classic" AppleTalk or MacTCP, that now takes advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the new Open Transport configuration utilities. However, they will not realize a significant performance increase on PowerPC Mac OS systems, nor can they take advantage of Open Transport's transport-independence capabilities.

Open Transport Ready applications are those that have been modified to adopt the new Open Transport APIs (XTI). They are PowerPC native, in addition to running on 680x0 Mac OS systems. Open Transport Ready applications not only benefit from the new configuration utilities, but have the opportunity for a significant performance boost when running on PowerPC Mac OS.

The third and final category of interoperability is referred to as Open Transport Enhanced. In addition to adopting the new Open Transport APIs and being PowerPC native, these applications have been modified to exploit the transport-independent capabilities of Open Transport, that is, they can be dynamically configured to support AppleTalk, TCP/IP, or serial communications.

Question: How is backward compatibility for AppleTalk implemented?

Answer: AppleTalk applications backwards compatibility is accomplished by intercepting all AppleTalk networking calls at the ".ddp" driver API. Above this protocol layer, applications written to the classic AppleTalk APIs continue to rely on the classic (680x0 based) implementation of AppleTalk. Calls to the ".ddp" driver are translated to the corresponding Open Transport XTI calls and are then passed to the new native implementation of DDP for processing. The process is reversed for incoming packets.

Using this approach, backwards compatibility is very robust - the classic implementations of ADSP, ASP, ATP, NBP, ZIP, and PAP are actually present (vs. simply mimicked). This also decreases the total memory footprint of backwards compatibility as compared to an implementation based on individual adaptation layers for each of the AppleTalk protocols. The primary trade-off of this approach is that applications relying on backwards compatibility do not gain any meaningful performance increases on PowerPC Mac OS; essentially only native DDP is actually in use in these cases.

Open Transport/AppleTalk also includes broad support for existing applications software and network devices that rely on the Chooser or the Network Control Panel software for selection and configuration, known as "cdevs" and "adevs" respectively.

Question: How is backward compatibility for MacTCP implemented?

Answer: TCP/IP (MacTCP) applications backwards compatibility is accomplished by

intercepting all MacTCP networking calls at the ".ipp" driver level. Calls to the ".ipp" driver are translated to corresponding Open Transport XTI calls and then passed to the native TCP/IP stack for processing. The process is reversed for incoming packets.

This approach allows most MacTCP applications to benefit from the native implementation of the TCP/IP protocols on PowerPC Mac OS, at least to some degree. While the backwards compatibility layer itself must run as 680x0 code, most of the handling of the packet happens in the new native Open Transport/TCP implementation. The drawback of this implementation is that "warts and all" backward compatibility is somewhat less robust; applications depending on idiosyncrasies of MacTCP or referencing internal MacTCP data structures are likely to need an update.

TCP/IP backward compatibility also includes targeted support for select software products that rely on the MacTCP (or Admin TCP) Control Panel software for configuration. Support for these software modules, known as MacTCP Link Access Modules, or simply "mdevs", is more limited than that provided for AppleTalk "adevs", due to certain technical considerations.

Question: Are there other compatibility issues with PCI Mac OS systems and existing network software products?

Answer: Certain network software products -- such as MacIPX from Novell, PathWORKS (LAT and DECnet) from Digital Equipment Corp. or Thursby Software Systems, and Insignia Solutions SoftWindows -- interact directly with the Mac OS Ethernet hardware, expansion slots, and driver software. With the introduction of PCI and Open Transport to Mac OS, these elements have changed substantially; PCI has replaced NuBus, the system Registry has replaced the Slot Manager, Open Firmware has replaced the role of NuBus ROMs, and DLPI has replaced the ".enet" driver API. If not addressed, these changes would have resulted in significant compatibility problems between PCI Mac OS systems and these network software products.

NOTE: For the latest communications software mentioned above, please contact the appropriate third-party vendor for compatibility information with Open Transport 1.1

To support these types of products, Mac OS System Software 7.5.2 (and more recent) includes a compatibility library that allows these products to identify and communicate with the built-in Ethernet controller on PCI Mac OS systems as if it were a "classic" NuBus Ethernet device. This compatibility software emulates not only the necessary low-level Ethernet driver calls, but also the Slot Manager and other related APIs necessary to preserve compatibility with these applications.

This compatibility software is limited, however, in that it supports access only to the built-in Ethernet adapter of PowerPC Mac OS systems with PCI. Thus, existing versions of products such as MacIPX and SoftWindows will not be able to take advantage of PCI network interface options such as token ring, fast Ethernet, or FDDI. New versions of these applications will be required to gain full access to all PCI NIC options.

Note that this compatibility module was not available in the original distribution of System 7.5.2 for the Power Macintosh 9500 (with Open Transport v1.0). This is one of the reasons that customers with 9500s were urged to update to System Enabler 1.1 or greater.

With the availability of System 7.5.3 this compatibility library is included as a part of system software. Customers using MacIPX should note that an updated version of the compatibility library is included as a Custom Install option with the System Update 2.0 installer. For more information regarding this updated library, please refer to the System Update 2.0 release notes.

Question: How is backward compatibility for NuBus network interface cards implemented?

Answer: For 680x0 and PowerPC Mac OS systems with NuBus, Open Transport v1.1 will allow use of existing NuBus NICs and drivers. This compatibility is provided by software support mapping DLPI driver calls generated by new Open Transport protocols to corresponding calls to "classic" Mac OS LAP Manager, .enet and .token APIs.

Question: Are there other known limitations to applications backward compatibility?

Answer: Yes, there are some. Applications that rely on undocumented APIs or examine private data structures in classic AppleTalk or MacTCP will not be fully compatible with Open Transport.

Examples include the MacSNMP AppleTalk and TCP/IP Agents (however, MacSNMP and the Macintosh System Agent are compatible), the Apple Internet Router 3.x and some utilities like MacTCP Watcher and MacTCP Spy.

Updated versions of these software products will be required for full compatibility.

Question: There have been reports of problems with MacX 1.2. Is there an Open Transport compatible X Window System server available?

Answer: Apple MacX 1.5 is compatible with Open Transport and is a recommended upgrade for all customers who have any earlier versions of MacX.

Although not related to Open Transport, there is a known bug in MacX 1.2 that can cause a system crash when running on System 7.5.2.

Question: There have been reports of problems with Apple Remote Access 2.0.1 and Open Transport. What is the status?

Answer: Apple Remote Access 2.0.1 is fully compatible with Open Transport v1.1.

Apple Remote Access 2.0.1 running on a system with the earlier Open Transport 1.0.x releases always operated in the "Remote Only" mode. In that mode, only resources at the remote site would be visible in the Chooser while connected via dial-up; local resources would reappear when the dial-up link was disconnected.

Question: There have been reports of problems with the use of Open Transport 1.0.x and network protocol analysis tools such as AG Group Etherpeek and Neon Software NetMinder. What is the status of this?

Answer: AG Group's Etherpeek Version 3.x and Open Transport 1.1 are compatible. Refer to the AG Group about EtherPeek and LocalPeek questions.

Question: There have been reports of problems with the Apple LaserWriter Bridge and LocalTalk Bridge and Open Transport. What is the status?

Answer: The LaserWriter Bridge and LocalTalk Bridge software has been updated to version 2.1 which is compatible with Open Transport 1.1 or later. Updaters are available on-line from Apple Computer's FTP and WWW sites.

Question: There have been reports of problems with MacTCP Ping and Open Transport. What is the status?

Answer: MacTCP Ping is an unsupported utility developed by Apple Computer specifically for MacTCP. It is not compatible with Open Transport. Compatible Ping utilities, such as MacPing Pro from Dartmouth, are currently available.

Question: There have been reports of problems with Assistant ToolBox and Open Transport. What is the status?

Answer: Assistant Toolbox version 1.3 is compatible with Open Transport. System 7.5.5 and later will include the capabilities of this software within Mac OS and the Assistant ToolBox will no longer be needed.

Article Change History:

- 06 Feb 1997 - Updated article for technical accuracy.
- 15 Apr 1996 - Added note to other compatibility issues questions.

Open Transport 1.1: Availability and Distribution Q & A (4/97)

Revised: 4/3/97
Security: Everyone

Open Transport 1.1: Availability and Distribution Q & A (4/97)

Article Created: 4 March 1996
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This article is the Reference Q & A (questions and answers) on availability and distribution of Open Transport 1.1.

DISCUSSION -----

Question: What is the current version of Open Transport, and what are its key features?

Answer: Open Transport v1.1.2 is the current release of Open Transport. This release is an update to Open Transport v1.1, to address the most pressing customer requests, in advance of the next feature release of Open Transport (currently planned as OT 1.5 - see Future Directions). Open Transport v1.1.1 includes the following updates and new features as compared to the earlier Open Transport 1.1 release:

- now also supports the Performa 5200, 5300, 6200, and 6300 systems;
- includes internal changes to minimize memory fragmentation resulting from dynamic loading and unloading of TCP/IP;
- includes changes to the TCP/IP DNR for inter-operability with sites using the load-balancing name daemon;
- includes changes for support of the upcoming Open Transport/PPP release;
- includes all bug fixes available to date.

Open Transport v1.1 is the version which comes with System 7.5.3. This general release is recommended for all supported Mac OS systems, and includes the following updates and new features as compared to the earlier Open Transport 1.0.x releases:

- now also supports 68030 and 68040 Mac OS systems,
- now also supports PowerPC Mac OS systems with NuBus,
- now also supports NuBus, SCSI, and CommSlot network interface adapters,

- offers tuning to optimize performance of high speed datalinks,
- offers tuning to support multiple client, multithreaded server applications,
- includes support for multinode and multihomed operation of AppleTalk protocols,
- adds support for raw packet access and promiscuous mode, to enable the development of Open Transport-ready network analyzers and other network management utilities,
- recognizes a significantly expanded selection of MacTCP dial-up network extensions (mdevs),
- allows reconnection of a dial-up TCP/IP session without reloading networking and without system restart,
- provides display of the datalink Media Access Control address for Ethernet and token ring networks,
- provides user notification in the event duplicate AppleTalk or TCP/IP addresses are established,
- automatically converts users' existing AppleTalk and MacTCP setting to Open Transport configuration files during installation,
- includes improved compatibility with Apple Remote Access 2.0.1,
- includes improved compatibility with a wider range of DHCP servers,
- provides a basis for future support for PPP-based AppleTalk and TCP/IP remote networking,
- provides a basis for future support for modem and ISDN communications devices,
- includes support for Mac OS system software System 7.5.3,
- includes support for the creation of a "universal system folder",
- includes support for the Network Software Selector utility to provide easy transition from classic to Open Transport networking on Mac OS systems supporting both,
- offers improved Balloon Help text for System 7 users,
- includes all bug fixes available to date.

Question: How is Open Transport v1.1 available?

Answer: Open Transport v1.1 is available through a broad range of distribution channels:

- as a no-charge upgrade to customers with existing MacTCP volume license software maintenance agreements;
- as a no-charge upgrade to customers with existing system software volume license software maintenance agreements;
- as a component of Mac OS system software release System 7.5.3;
- as a component of Mac OS system software update System 7.5 System Update 2.0;
- as a retail software product in single-user software package;
- through an OEM redistribution licensing program from Apple Software Licensing,
- bundled with Apple and third party applications software that are Open

Transport-ready,

- from select Apple-licensed publishers and Internet Service Providers.

Question: How will volume license software maintenance customers receive Open Transport?

Answer: A master copy of the Open Transport software and documentation will automatically be mailed to the contact of record for customers with active MacTCP or Mac OS System Software maintenance contracts.

Question: How could a customer receive a copy of System 7.5.3?

Answer: System 7.5.3 will be pre-installed on Mac OS systems beginning in first half calendar 1996. System 7.5.3 will also become available as a shrink-wrap retail product in first half calendar 1996.

Question: How could a customer receive a copy System 7.5 System Update 2.0?

Answer: System 7.5 System Update 2.0 is available through a variety of channels, including:

- On the Internet at the following sites:
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com/>>
- On America Online, use keyword: applecomputer
- On CompuServe, use GO: APLSUP
- Through Apple User Groups,
- From the Apple Order Center, in floppy or CD update kits. The update is available at no charge plus \$13 shipping and handling. Call U.S. 800-293-6617, ext. 984 to order.

Question: What is the part number and pricing for the Open Transport single-user software package?

Answer: In the U.S. order number M4252Z/A; the estimated retail price is \$39.

Question: Will Open Transport be localized for non-English speaking countries?

Answer: As a part of Mac OS System 7.5.3, Open Transport will be localized around the world. Generally speaking, within 60 days after the update is released in the U.S., a localized version will be available in most major languages in North America, Europe, and Australia. Other regions will provide the improvements that are delivered in this update at a later date. Please contact the Apple Assistance Center in your area for details.

Question: How is Open Transport available to software developers, publishers, and/or Internet Service Providers (ISPs) for redistribution and bundling?

Answer: Apple offers two different redistribution licensing agreements for Open Transport, designed to meet the needs of publishers, software developers, and ISPs.

The first agreement is designed for Internet service providers, network and communications reference work authors and publishers, and others interested in bundling Open Transport software as an added customer benefit to their product or service offering. This license is based on a sliding-scale per-unit license fee, and requires annual reporting of licenses issued. Interested parties should send electronic mail to SW.LICENSE@apple.com.

The second agreement is designed for software developers with products that adopt the new Open Transport APIs who wish to ship Open Transport as a part of an integrated product installation process. This agreement is based on an addendum to the Mac OS SDK, and allows qualified developers to ship the Open Transport run-time environment to end-users as a part of their product.

To qualify, developers must execute the Open Transport License Addendum through Apple Software Licensing, and meet the following requirements:

- have developed an Open Transport-ready or Open Transport-enhanced software product,
- be current subscribers to the Mac OS SDK,
- provide Apple advance notice of their intent to ship their Open Transport product(s),
- distribute the required Open Transport components only in conjunction with their product(s),
- annually report the total number of licenses issued.

Other terms and conditions apply, however, no additional fees (beyond the Mac OS SDK subscription) are required for this license. Interested parties can send electronic mail to SW.LICENSE@apple.com.

Question: Will localized versions of Open Transport software be available for developer and ISP licensing?

Answer: Initially the Open Transport redistribution licensing program will only have the U.S. English version of the software available. Licensing of localized versions of Open Transport will depend upon demand and availability.

Question: What of the earlier Open Transport v1.0.x releases?

Answer: Open Transport v1.0.x releases were all designed for use only on the Apple PCI Macintosh systems:

- Open Transport version 1.0, for the Power Macintosh 9500, was focused on offering compatibility with existing networking client applications and on upgrading the feature set and performance of TCP/IP. It shipped only as an integral part of system software with the 9500.
- Version 1.0.1 was a maintenance update, designed to correct a potential problem with data truncation in large file transfers. Open Transport v1.0.1 was distributed electronically, as an update to be applied to an existing installation of Open Transport v1.0.
- Version 1.0.6 added support for the Power Macintosh 7200, 7500, and 8500 systems and addressed bugs discovered since the 1.0 release. Open Transport v1.0.6 shipped as a component of System Software 7.5.2 version 2 on the Power Macintosh 7200, 7500, 8500, and 9500 models.
- Version 1.0.7 included changes to improve performance and compatibility of Open Transport/TCP with third party SLIP and PPP software and with certain Internet Service Providers (ISPs). Open Transport v1.0.7 was distributed electronically, as an update to be applied to an existing installation of Open Transport v1.0.6.
- Version 1.0.8 was also a maintenance release, and included better compatibility with Qualcomm Eudora, Claris EMailer and EMailer Lite, CE Software QuickMail, and Netscape Communications client software, as well as improvements in BootP and DHCP interoperability. Open Transport v1.0.8 was distributed via a variety of information services and a number of Internet sites - as a full installation of Open Transport software.

Question: Why was Open Transport made available on PCI Power Macintosh systems first?

Answer: Starting with the introduction of the Power Mac 9500, Apple moved to adopt industry standards for both network driver software - Open Transport DLPI - and network hardware - PCI. This strengthened the business case for new and existing third party developers who could, as a result, include Mac OS on PowerPC in their plans for cross-platform network connectivity products. The Power Macintosh 9500 was the first system to incorporate both of these standards, and has since been followed by additional systems and configurations.

In particular, Apple made the business decision to move to standards for networking on the hardware and software fronts in tandem, that is, PCI and DLPI. This created a dependency that required customers deploy Open Transport with their PCI Mac OS systems. It also minimized the work by third parties needed to create drivers for new PCI networking cards. As a result customers have found a broad selection of third party PCI networking options for Mac OS.

Open Transport 1.1: Developer Adoption Q & A (3/96)

=====

Article Created: 4 March 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on developer adoption for Open Transport 1.1.

DISCUSSION -----

Question: Which third party developers support Open Transport?

Answer: Seeding of Open Transport among developers began more than a year in advance of release, and reached more than 5,000 developers. Several hundred developers are actively working with Apple on development efforts.

The following software developers are among those who have announced support for Open Transport to date:

- ACI
- Adobe Systems
- AG Group
- AGE Logic, Inc.
- Asanté
- Atomic Games
- Carnegie Mellon University
- CE Software
- Claris Corporation
- Dantz Development
- Delphic Software, Inc.
- Digital Ocean
- EveryWare Development Corp.
- Farallon Computing, Inc.
- Gradient Technologies
- HI Resolution Software
- Hughes Advanced Systems

- IBM
- Intercon Systems, Inc.
- Maxum
- Mentat Inc.
- Metrowerks, Inc.
- Neon Software
- NetManage, Inc.
- NorthWestern University
- Novell
- Pacer Software
- Pole Position Software GmbH
- Progressive Networks
- Quark, Inc.
- Remedy Corp.
- Seaquest Software
- SoftArc
- StarNine Technologies, Inc.
- Starlight Networks
- Systematics Softworks GmbH
- The University of Michigan
- The Wollongong Group
- Thursby Systems Software, Inc
- Vicom Technology
- Wall Data
- White Pines
- WRQ

The following developers have announced support for both Open Transport and PCI on Power Macintosh:

- Asanté
- Attachmate
- Creative Solutions
- Dayna
- Digiboard
- Digital Equipment Corporation
- Efficient NW
- Farallon Computing, Inc.
- Focus
- Fore Systems, Inc.
- 4-Sight International Limited
- Hermstedt GmbH
- Innosys
- Interphase
- Newer Technology
- Neutral
- QLogic
- Rockwell
- SAT/Sagem
- SCii Telecom
- Silicon Valley Bus
- Spectra Systems
- Workstation Technologies

Open Transport 1.1: For More Information Q & A (3/96)

Article Created: 4 March 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) for more information on Open Transport 1.1.

DISCUSSION -----

For More Information

Question: How can interested parties get more information on Open Transport?

Answer: Documentation for Open Transport is publicly available by anonymous ftp on the Internet at a number of sites, including
<ftp://seeding.apple.com/opentransport/>.

Question: Can customers apply to receive pre-release copies of Open Transport for implementation testing?

Answer: The Open Transport Early Access program provided pre-release access to Open Transport v1.1. Since the product is now shipping, pre-release seeding of the Open Transport 1.1 has been discontinued. As plans for future versions of Open Transport develop, Apple expects to offer a similar customer testing and preview program. Announcement of details will occur at the appropriate time.

Question: Can developers apply to receive pre-release copies of Open Transport for development and testing?

Answer: The Open Transport v1.1 developer seeding program reached over 5,000 developers. Since the product is now shipping, pre-release seeding of the Open Transport 1.1 has been discontinued. A new seeding program is anticipated for future versions of Open Transport. Details will be announced at a later date.

The Open Transport software developers kit (SDK) is available as a component of the Mac OS SDK, and is available on the Internet at ftp://seeding.apple.com/ess/public/opentransport/SDK_OT_Client

Question: How can developers get support while developing Open Transport applications?

Answer: Apple Developer Support services have engineering specialists fully trained on Open Transport development and debugging. Access to these engineers is just one of the benefits of the Apple Developer Partner's program.

For more information on Apple's Developer Support services, including information on how to register as an Apple Developer Partner, contact the Macintosh Developer Services Information Line at US 408-974-4897.

For developers not a part of Apple's Developer Support services programs, Apple has assigned evangelism resources to the support of Open Transport. All interested developers are encouraged to contact Open Transport Evangelism by email to opentpt@applelink.apple.com.

Question: Are there general reference sources on XTI, STREAMs and DLPI?

Answer: Sources of information that are applicable to XTI and STREAMs include:

- OSF/1 Operating System: Network Applications Programmer's Guide; Open Software Foundation, Prentice Hall, ISBN 0-13-640145-7
- UNIX Network Programming; W. Richard Stevens, Prentice Hall, ISBN 0-13-949876-1
- UNIX System V Release 4: Programmer's Guide: STREAMs; Unix Press (A Prentice Hall title), ISBN - 0-13-020660-1
- Programming UNIX SVR4.2: Network Programming Interfaces; UNIX Press (A Prentice Hall title), ISBN 0-13-017641-9
- X/Open CAE Specification: X/Open Transport Interface (XTI); X/Open Company, Ltd. (XO/CAE/91/600) ISBN 1-872630-29-4
- Transport Provider Interface Specification, rev 1.5 (92/12/10); UNIX International, OSI Special Interest Group
- Data Link Provider Interface Specification, rev 2.0.0 (91/08/20); UNIX International, OSI Work Group

Open Transport 1.1: Network Compatibility Q & A (9/96)

=====

Article Created: 4 March 1996
Article Reviewed/Updated: 10 September 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on network compatibility for Open Transport 1.1.

DISCUSSION -----

Question: Is Open Transport interoperable with installed AppleTalk and TCP/IP networks?

Answer: Open Transport 1.0.x is compatible with existing AppleTalk and TCP/IP networks at the "packets on the wire" level. Organizations can introduce one, a few, or hundreds of new Mac OS systems running Open Transport into their environment without worrying about interoperability with existing networking services.

Question: There have been reports of problems with the PCI Mac OS systems when transferring large files over Ethernet networks. Is this due to running Open Transport software?

Answer: Apple has received reports describing problems transferring large files from PCI Macintosh systems to a variety of AFP servers. The reports state that file transfers stop and a -1072 error is generated. The reports also state that after the problem occurs, both AppleTalk and TCP/IP services are lost and systems must be restarted to restore them. If Ethernet traces are taken, they show that the system disappears from the network.

This problem has been identified as a bug in the Ethernet driver that can exhibit itself if there is a lot of PCI bus activity. In this case, it is possible that Ethernet DMA will start to transmit a packet, and an under run will occur because DMA cannot get enough bandwidth to transfer the entire packet to the Ethernet controller. If this condition occurs more than 10 times in

sequence, the bug in the driver causes it to not recover the buffers associated with the under run. The driver allocates 10 buffers; when they are gone the transmitter will not longer be able to send packets. This problem could occur in some normal situations with a lot of disk activity.

This problem is present only in the built-in Ethernet drivers that shipped with the Power Macintosh 7200, 7500, 8500, and 9500 systems prior to the availability of System 7.5.3. (The first Power Macintosh 9500 systems shipped with v1.0 of this driver; the Power Macintosh 7200, 7500, and 8500 systems shipped with v1.0.1.)

Apple has released an updated driver that fixes this problem, first available as version 1.0.2 of the "Ethernet (Built-in)". The most current version of this driver is included with System 7.5.3.

Question: There have been reports of problems with the Power Mac 7200/90 and its operation on Ethernet networks. Is this due to running Open Transport software?

Answer: Apple has determined that under certain network conditions, independent of the protocol being utilized, a Power Macintosh 7200/90 may fail to send large packets over its built-in Ethernet. The trouble mode is that the 7200/90 may lock-up, time-out, or have extremely slow Ethernet performance under certain conditions. These conditions generally occur only when transferring large packets of data over large and busy networks.

The problem has been isolated to the 7200/90 system logic board, and is limited to the subset of 7200/90 systems with a serial number lower than "XX544XXXXXXX". No other Power Macintosh, Power Macintosh LC, Performa or PowerBook models experience this problem, including the 7200/75. The problem is not related to Open Transport.

Apple has proactively notified customers of this issue, and has instituted troubleshooting procedures to make it easy to determine if a system is impacted. All manufacturing sites have implemented a logic board change and Power Macintosh 7200/90 systems currently available should not be affected by this issue.

If a customer has completed the troubleshooting procedures and finds that their 7200/90 experiences the trouble mode, they should contact their local Apple Authorized service provider or call Apple (1-800-SOS-APPLE in the US) to be advised on how to have the logic board replaced free of charge.

Question: Is Open Transport compatible with existing Internet Service Provider offerings?

Answer: Open Transport/TCP currently supports dial-up connectivity to TCP/IP networks, including the Internet, through backward compatibility with select third party software modules known as mdevs.

With the appropriate software installed, end-nodes can use either SLIP or PPP to connect to Internet Service Providers and other dial-up IP-access points. Not

all versions of all mdevs are supported by Open Transport compatibility services, thus it is important that recommended versions of software be installed for the greatest level of compatibility.

It is also very important that TCP/IP addressing and other configuration information be properly configured. As there is a new human interface provided by Open Transport/TCP, there are some differences in the process as compared to the older MacTCP software. In particular, when running TCP/IP over a SLIP or PPP link only, it is recommended that the "router address" and "subnet mask" fields be left blank in the TCP/IP control panel.

Question: Which MacTCP dial-up extensions ("mdevs") are supported by Open Transport/TCP?

Answer: Apple has worked together with third party developers to test a variety of mdevs with Open Transport 1.1. The following mdevs, when installed, will appear listed by name in the "Connect Via:" pop-up menu in the TCP/IP control panel:

- FreePPP - Apple and the developer recommend that you use version 1.0.5 or more recent.
- InterPPP II - Apple and the developer recommend that you use version 1.1 or more recent.
- InterSLIP - Apple and the developer recommend that you use version 1.0.1 or more recent.
- MacSLIP - Apple and the developer recommend that you use version 3.0.2 or more recent.
- MacPPP - Apple and the developer recommend that you use version 2.1.4 SD or more recent (version 2.2.0 is not recommended).
- SonicPPP - Apple and the developer recommend that you use version 1.0.2 or more recent.
- VersaTerm SLIP - Apple and the developer recommend that you use version 1.1.4 or most recent.

Question: Are any other mdevs recognized by Open Transport?

Answer: There are a number of third party PPP mdevs that are all derived from a common technology base, FCR PPP. The derivative implementations have not been individually tested by Apple, although Apple and FCR have worked closely together in testing the core technology.

Each of these derivatives registers with Open Transport using the same "signature". When any one is installed, it will appear as "TCP/IP PPP" in the menu, rather than as it's own brand name. These include:

- About Software FCR PPP
- 4-Sight 4-Sight PPP
- InterCon InterPPP
- Network Telesystems NTS PPP
- Pacer Software PacerPPP
- SAT/SAGEM PlanetPPP
- Tribe TribePPP
- White Pine Software WhitePine PPP

Users are always encouraged to check with the third party developer of interest for the most recent information on versions and compatibility.

Question: Is PPP connectivity distributed as a bundled component of Open Transport v1.1?

Answer: No, not at this time. AppleTalk and TCP/IP connectivity using Open Transport/PPP is planned as a feature of future products, with PPP support for Open Transport/TCP expected first to be followed by AppleTalk/PPP later.

Apple plans to merge remote access client and personal server capabilities with Open Transport capabilities, to offer an integrated support for LANs, WANs, and remote networking. These capabilities are also expected as a part of a future Mac OS update. Details will be announced at a later date.

Question: Does Apple currently offer a solution for SLIP or PPP dial-up to the Internet?

Answer: Yes. The Apple Internet Connection Kit (AICK) is a selection of the most popular Internet applications from third party companies, including the Netscape Navigator and RealAudio Player from Progressive Networks, as well as Claris Emailer Lite.

AICK 1.1 includes MacPPP 2.5 (Version 1.0 included MacPPP 2.1.4) along with the Apple Internet Dialer - software designed to make it simpler for Mac OS customers to register with a qualified Internet Service Provider (ISP) and get connected to the Internet. To help users work with their Internet applications, the Apple Internet Connection Kit includes AppleGuide software for on-line assistance.

Question: Does the Apple Internet Connection Kit require Open Transport?

Answer: The Apple Internet Connection Kit (AICK) can support either MacTCP 2.0.6 or Open Transport/TCP 1.x.

Note that the Apple Internet Dialer 1.0 (part of the Apple Internet Connection Kit 1.0) should not be used with System 7.5.3 unless the following procedure is first performed (note that this procedure is not required on PowerPC PCI Mac OS systems):

- Use the Network Software Selector utility to specify classic networking

- Restart the system
- Remove MacTCP from the control panels folder
- Use the Network Software Selector utility to specify Open Transport networking
- Restart the system

The Apple Internet Dialer 1.0 will now work correctly with System 7.5.3. Alternately, Customers should update their copy of AICK with the Apple Internet Dialer 1.1. This revision of the dialer is fully compatible with Open Transport 1.1 and System 7.5.3

Question: What is MacPPP 2.5 / 2.1.4? Is it available on the Internet?

Answer: MacPPP 2.5 and 2.1.4 are derivatives of the MacPPP 2.1.x SD versions of Merit's PPP. They include code contributed by Apple engineering to enhance compatibility with Open Transport/TCP.

Question: There have been reports of problems with Open Transport, PPP, and the use of Virtual Memory. Is Open Transport compatible with Virtual Memory?

Answer: Open Transport fully supports the use of virtual memory. However there were some problems with MacPPP versions 2.1.x SD and versions of FreePPP prior to 1.0.4; MacPPP 2.5 and FreePPP 1.0.5 have corrected these problems . Users are advised to update to the most recent version of the software, or temporarily turn VM off.

Question: Are there known limitations to backward compatibility mdev support?

Answer: Due to some shortcomings in the Open Transport 1.0.x backward compatibility services, there were some additional limitations with earlier versions of Open Transport:

- Some mdevs were not be able to auto-dial, that is, automatically connect to the service provider when launching a TCP/IP application. This has been addressed with updated versions of mdevs.
- Once a TCP/IP application launched and used a SLIP or PPP mdev, use of a different mdev could have required restarting the Macintosh. Disconnecting from and re-dialing a service provider could also have the same effect. This has been corrected in Open Transport v1.1.

Question: Are there differences in configuring Open Transport/TCP and MacTCP for Internet Service Providers (ISPs)?

Answer: Some ISPs do not strictly follow standards, which call for assigning end-node IP addresses on the same subnet as the router (gateway). Open Transport strictly enforced this requirement in versions prior to 1.0.7. In versions since OT 1.0.7 (including 1.1), the TCP/IP Control Panel automatically generates a compatible router address to facilitate connectivity to the ISP. To take

advantage of this feature, the user simply leaves the router and subnet mask fields empty when configuring Open Transport/TCP for dial-up access.

Question: If a user needs an updated copy of an mdev, where can they find the software?

Answer: Sources for software vary, as some products are commercial, and some are shareware or public domain.

- FreePPP is shareware and can be found on a variety of Internet sites; typically at "info-mac" mirror sites in the comm/tcp directory. A list of info-mac mirror sites can currently be found at:

<http://www.mcp.com.hayden/iskm/info-mac-mirrors.html>

Some sites where FreePPP can be found currently include:

<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/>
<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/>

- InterPPP and InterPPP II are commercial software products. For availability and ordering information contact InterCon Systems, US +1-800-468-7266 or 703-709-5500.
- MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information contact TriSoft, US +1-800-531-5170 or 512-472-0744.
- VersaTerm SLIP is commercial software developed by Synergy Software. For availability and ordering information contact Synergy, US +1-610-779-0522.
- MacPPP (v2.1.4) is available as a part of the Apple Internet Connection Kit, Apple Computer Inc., US +1-800-462-4396 for fax information or +1-800-538-9696 to locate an Apple reseller near you.

Open Transport 1.1: Network Interface Options Q & A (3/96)

=====

Article Created: 4 March 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on network interface options for Open Transport 1.1.

DISCUSSION -----

Question: What network interface options are available with Open Transport?

Answer: Open Transport v1.1 supports PCI and NuBus NICs, CommSlot and built-in (LocalTalk and Ethernet) network adapters. For models without slot-based expansion options, Open Transport v1.1 supports SCSI-attached network adapters, including PC Cards compliant with the Macintosh PC Card specifications.

NIC options available for Open Transport include Ethernet, token ring, fast Ethernet, FDDI, and ATM.

Question: What about dial-up network connectivity solutions?

Answer: For connectivity to AppleTalk networks, Open Transport v1.1 is fully compatible with Apple Remote Access v2.0.1 client and personal server.

For dial-up connectivity to TCP/IP networks including the Internet, Open Transport recognizes third party MacTCP software extensions (known as mdevs), providing SLIP or PPP connectivity.

Question: Does Open Transport influence or restrict the choice of modems for dial-up communications?

Answer: No. Open Transport provides a new, consistent programming interface for serial communications from within system software. However, there are no changes

in the external behavior of the serial ports based on the presence or absence of Open Transport on a system.

Open Transport 1.1: Network Planning and Admin Q & A (3/96)

Revised: 3/25/96
Security: Everyone

Open Transport 1.1: Network Planning and Admin Q & A (3/96)

Article Created: 4 March 1996
Article Reviewed/Updated: 25 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on network planning and administration for Open Transport 1.1.

DISCUSSION -----

Question: Does Open Transport offer network managers more control over Mac OS networking?

Answer: Yes. Open Transport allows network managers to specify details of the network connection and configuration in advance, via a "preferences" file. These configurations may contain a mixture of user-provided information and network manager recommended and/or network manager required settings. Recommended data provides a default for the end-user, while required configuration data is locked with an administrator's password.

Open Transport configurations can be prepared on one machine and distributed to other systems. To support this, the Open Transport configuration utilities allow a configuration to "exported" and "imported". Exported configurations can be distributed via electronic mail, a file server, or even "sneaker net".

Question: Will Open Transport require organizations to make changes in network administration, planning, or design?

Answer: The first Open Transport protocols -- AppleTalk and TCP/IP -- offer new features that give a network manager more flexibility and control. Some of these features, when implemented in a network environment will require additional thought and planning by a network manager.

In particular, Open Transport/AppleTalk adds support for the use of static (manually assigned) AppleTalk node addresses. If implemented, a network manager

may prefer to assign addresses based on a pre-designed protocol address management plan. Open Transport/TCP adds support for the Dynamic Host Configuration Protocol (DHCP). DHCP allows network managers to allocate IP addresses and other configuration information from a DHCP server. Optimum deployment of DHCP services within an enterprise requires planning.

In order to better conform to applicable standards, Open Transport/TCP also has somewhat more rigorous requirements regarding the content and format of the local HOSTS file. This could require some updating of existing MacTCP-compatible host files. See TCP/IP Features for more information.

Question: Does the use of AppleTalk manual addressing increase the requirement for network administration?

Answer: Open Transport/AppleTalk offers network administrators a choice. Sites that prefer to have the network infrastructure automatically assign unique protocol addresses can continue to rely on AppleTalk Address Resolution Protocol (AARP). Sites that find advantage in having fixed and well-known protocol addresses for each end-node can implement manual addressing.

When manual addressing is selected there will be a requirement to allocate and assign the initial protocol addresses, which will subsequently be "locked". Some administrators may prefer to do this allocation based on a central numbering plan, creating individual configuration templates (recommended or required settings) for each user. Others may prefer to allow the network to determine the initial address configuration (that is, use dynamic addressing once), and then lock the uniquely assigned addresses after initialization.

It is important that all nodes on each individual AppleTalk subnet (a given cable segment assigned a unique network number or network number range) be administered consistently - either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict between a new dynamic node acquiring an address assigned to an off-line, manually-addressed node. Administrators can enforce the addressing policy for a subnet by locking the addressing mode in the "dynamic" or in the "manual" state. As an administrative precaution, however, Open Transport/AppleTalk does continue to check for the presence of duplicate protocol addresses on the LAN when static addressing is configured.

Question: Are there other benefits that arise from the new support for AppleTalk manual addressing?

Answer: Yes. Manual configuration of static AppleTalk addresses supports MacOS products that utilize WAN datalinks where non-full-mesh topologies are important. This includes datalinks such as Frame Relay, SMDS, and ATM.

Question: Does Open Transport/TCP support BootP?

Answer: Yes. Open Transport v1.1 fully supports Boot Protocol (BootP). With Open Transport v1.0.x, there was an error condition in which Open Transport would

fail to accept a BootP Reply if it were sent to the unicast (subnet broadcast) address, that is, xxx.xx.x.255; replies sent to the all-nets broadcast address (that is, 255.255.255.255) were handled properly. Both situations are correctly handled by Open Transport v1.1.

Open Transport 1.1 now also supports BootP gateways located 1 or more hops away. Earlier versions of Open Transport required that the BootP gateway be zero hops away.

Question: Which DHCP servers are supported by Open Transport/TCP?

Answer: Apple's implementation conforms to the current versions of the applicable specification documents (RFCs). To date, Open Transport/TCP has been tested with the following DHCP server implementations:

- Competitive Automation,
- FTP Software (<http://www.ftp.com>),
- Hewlett Packard HP-UX (<http://www.hp.com>),
- Microsoft Windows NT Advanced Server,
- Silicon Graphics (<http://www.sgi.com>),
- Sun Solaris and SunOS (<http://www.sun.com>), and
- TGV (<http://www.tgv.com>).

Question: Does Open Transport/TCP support DHCP address leases?

Answer: Yes. Open Transport/TCP fully supports DHCP address leases. Open Transport/TCP will automatically attempt to renew any address lease that reaches it's renewal interval, which defaults to half of the lease's lifetime. (The Renewal Interval may be configured to a different value by making changes to the configuring DHCP server). Renewal will be attempted regardless of how many times the lease has already been renewed.

Should an interface's IP address lease expire, the interface will be closed down.

Question: Are there interoperability issues of note regarding DHCP servers?

Answer: Some DHCP servers require padding to a fixed packet size; other servers do not accept padded packets. Open Transport 1.1 automatically adapts to the type of DHCP requests that a given server accepts, while earlier versions sent non-padded packets.

Network managers should also note that Open Transport 1.1 now supports DHCP gateways located one or more hops away. Earlier versions of Open Transport required that the gateway be zero hops away.

Question: Can Open Transport/TCP act as a DHCP client to a Windows NT Advanced Server?

Answer: Yes. With Open Transport v1.1, MacOS clients are fully interoperable with the Windows NTAS DHCP server.

Macintosh clients running earlier versions of Open Transport (1.0.x) could experience some of the following interoperability problems due to differences between the Microsoft implementation and that of a typical UNIX server.

- Clients running Open Transport v1.0 or v1.0.1 were not able to acquire leased IP addresses.

This was due to unusually long reply-time-out values used in the NTAS implementation. Open Transport v1.0.6 was changed to accommodate NTAS behavior in this regard.

- Clients running Open Transport versions prior to v1.0.8 would be incompletely configured via DHCP.

NTAS sends only IP address, IP address lease information, the configuring server's IP address, and a subnet mask. Investigation revealed that other configuration options entered in the NT DHCP server's database (default gateway address, domain name server addresses, domain name, broadcast address, and so on) were not sent unless specifically requested by the client using the DHCP Parameter Request List option.

Apple believes that requiring use of this option in order for the client to be properly configured is contrary to the DHCP server specification described in RFC 1541 (Dynamic Host Configuration Protocol), and it appears to be unique to the NTAS implementation. However, in interest of interoperability, Open Transport v1.0.8 and v1.1 use the Parameter Request List option to request default gateways, DNS servers, domain name, subnet mask, and broadcast address. This permits Open Transport/TCP clients to be fully configured by these servers, at the expense of a few additional packets on the wire during the initialization phase.

Question: Can Open Transport/TCP act as a WINS client to a Windows NT Advanced Server?

Answer: No, not at this time. The Microsoft WINS server is dependent on Microsoft extensions to TCP/IP (requiring NetBIOS support) that provide some automation for assignment and registration of IP host and domain names.

The Internet Engineering Task Force (IETF) is developing a cross-platform industry standard technology for dynamic registration and look-up of IP names through the Dynamic Service Location working group.

Apple has no current plans to implement the WINS extensions. Instead, we are fully committed to implementation of the applicable IETF standards as they emerge. We welcome customer feedback on this topic -- should sufficient demand for a WINS client materialize, we'd be open to exploring this issue. A future MacOS WINS client would be dependent upon Microsoft releasing sufficient technical detail regarding their proprietary extensions to IP to make an interoperable implementation possible.

Question: When installing and configuring Open Transport, are there any additional issues of note for network managers?

Answer: The following observations and comments have been developed based on the recent OT 1.1 b16 Internet-based public preview program.

- Because the new domain name resolver supplied with Open Transport/TCP is both more capable and more standards compliant than the one included with MacTCP, some configuration changes may be desirable or necessary. Areas of interest and caution are noted in the section TCP/IP Features and System Requirements.

- Network managers should also note that although the TCP/IP control panel can properly receive and utilize multiple gateway and name server addresses from a DHCP server, only the first one returned will be displayed in the TCP/IP control panel. This will be resolved in a release after OT 1.1.

- Users are occasionally encountering "Error -3205" when opening a connection in a TCP application. This can result if the user has manually modified (moved, renamed, or deleted) some of the files installed by Open Transport. In particular, both the Shared Library Manager and Shared Library Manager PPC files must be installed when running on a PowerPC MacOS system. For more information on these two files, refer to the description of files installed by Open Transport elsewhere in this Q&A.

In general, users should not attempt to modify the OT installation through any means other than the Apple supplied installer scripts.

- Users are occasionally encountering an error message like "Cannot open connection to DNS Name Server" when trying to run classic MacTCP applications. This can result if the user has manually modified (moved, renamed, or deleted) some of the files installed by Open Transport. In particular, the MacTCP DNR file must remain in the System Folder at the root level for backward compatibility to function.

In general, users should not attempt to modify the OT installation through any means other than the Apple supplied installer scripts.

- Beginning with System 7.5, TCP/IP support was included with the MacOS but was not automatically installed (it required a Custom Install action). As of System 7.5.3 and Open Transport, TCP/IP services are always installed. However, if there are no MacTCP preferences on the target disk, TCP/IP is installed with a default configuration specifying configuration via MacIP in the current AppleTalk zone, but it is set to "Never Load". To enable TCP/IP, use the TCP/IP Control Panel in the Advanced or Administrator mode and select the Options dialog.

Open Transport 1.1 and Servers Q & A (3/96)

Article Created: 4 March 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on Open Transport 1.1 and Servers.

DISCUSSION -----

Question: What role does Open Transport play for servers?

Answer: The Open Transport architecture is designed to provide server applications - file, print, database, e-mail, directory, and other - with a foundation for higher performance and for more flexible configuration, while maintaining the historical differentiation of Mac OS servers - ease of configuration and administration.

Question: How will Open Transport enhance server flexibility?

Answer: Open Transport introduces the capability of activating more than one network connection at the same time, using the same networking protocol. This capability is known as multihoming, and enables servers to support more clients, to offer greater total performance, and to increase the reliability of mission critical applications.

Open Transport also enables the development of transport independent applications. This will be especially valuable for server applications which need to be deployed in AppleTalk, or TCP/IP, or NCP/IPX, or other protocol environments.

Question: How will Open Transport enhance server performance?

Answer: Servers, as network-aware applications, gain access to the higher

performance PowerPC native implementation of networking protocols that Open Transport provides. To exploit this performance opportunity, server applications must be accelerated for PowerPC and must utilize the new Open Transport XTI APIs.

Severs will also benefit through access to new high-speed PCI datalink implementations such as fast Ethernet and ATM.

Question: Will Apple's server products such as AppleShare exploit Open Transport features?

Answer: Yes. AppleShare 4.2.1 is the first version of AppleShare to be both PowerPC native and Open Transport ready. It takes advantage of other Open Transport features as well, including support for multihoming.

Question: Are PCI Mac OS systems with Open Transport recommended as application servers?

Answer: Apple recommends that server application developers adopt Open Transport v1.1 as the basis for new network applications development as soon as is possible within their product life cycles. As these updated versions of server software become available customers will find that the combination of PCI, Power Macintosh, and Open Transport makes a great platform for flexible, high-performance network applications.

It should also be noted that Apple generally recommends the Apple Workgroup Server product family, rather than re-purposed desktop hardware, for use as server platforms.

Open Transport 1.1: Future Directions Q & A (3/96)

=====
Article Created: 4 March 1996
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on future directions for Open Transport.

DISCUSSION -----

Question: What is the next planned release of Open Transport?

Answer: Open Transport v1.1.1 is anticipated as a "rapid response" release to follow up quickly to priority issues, if any, that surface after the release of Open Transport 1.1.

The next features driven release planned for Open Transport is under the working title of OT 1.5, is planned for availability sometime in Q4 1996. More information about the features, availability, and distribution of this update will be released as it becomes available.

Question: What additional network interface options are planned to be available for Open Transport?

Answer: Modem and ISDN support are to be available following the introduction of the next generation of Apple Remote Access products (incorporating Open Transport/PPP and Open Transport v1.1).

Question: Will Open Transport/TCP offer multihoming and multinode capabilities in a future release? Will users be able to configure general multihoming and multinode operation in the future?

Answer: In a future release of Open Transport, multinode and multihoming capabilities for both AppleTalk and TCP/IP are planned as configurable options

for network administrators and advanced users.

Question: What about MacSNMP? When will it be revised to work with PCI and Open Transport?

Answer: MacSNMP v1.5 is planned to be available in 1996. This release is designed to include support for MIB II statistics from the Open Transport/TCP stack, transport of SNMP data over Open Transport/TCP, and to add support in the Macintosh System MIB for both NuBus and PCI interface cards.

MacSNMP and the Mac System Agent are supported through Open Transport's backward compatibility services.

Question: What about the Apple Internet Router? Will it be revised for Open Transport?

Answer: Apple is not announcing future plans regarding this product at this time.

Question: Will Apple or Novell deliver an Open Transport-ready Mac OS client that uses IPX protocols?

Answer: Novell currently offers the NetWare Client for Mac OS v5.1, providing access to file, print, and NetWare Directory Services (NDS) using NCP/IPX protocols.

An Open Transport-ready implementation of NetWare protocols and client services is currently under investigation. The two companies are not ready to announce product details or availability at this time.

Question: Will Apple or Microsoft deliver an Open Transport-ready Mac OS client that uses NetBIOS/TCP protocols?

Answer: Windows NT AS currently includes strong Mac OS connectivity solutions based on AppleTalk protocols. Other protocol options are under investigation at Apple, Microsoft, and with third parties. No additional details are available at this time.

Question: Will Apple provide a PowerPC native standards based SLIP or PPP solution for Open Transport?

Answer: Apple is developing an implementation of PPP for Open Transport as a part of the next generation of Apple Remote Access products. Dial-up access to AppleTalk and TCP/IP networks will be based on the following RFCs:

- RFC 1661 - PPP
- RFC 1662 - PPP in HDLC-like framing
- RFC 1570 - PPP LCP extensions

..TIL19434-Open_Transport_1-1-Future_Directions_Q_and_A_3-96.pdf

- RFC 1334 - PPP Authentication protocols
- RFC 1663 - PPP Reliable transmission
- RFC 1378 - ATCP AppleTalk Control Protocol
- RFC 1332 - IPCP Internet Protocol Control Protocol

Question: What about IP version 6 (IPv6) support in Open Transport?

Answer: IPv6 is an proposed update of the current Internet Protocol (IPv4), part of the TCP/IP suite of protocols used to allow computers to communicate with each other over the Internet. The Internet Engineering Task Force (IETF) is in the process of specifying the standards for IPv6.

IPv6 is being designed to respond to the limitations of IPv4 - including an upcoming shortage of new IP addresses - to allow for the continued expansion of the Internet and deployment on corporate networks. IPv6 also incorporates new functionality to provide security, multimedia support, and plug and play capabilities, features necessary to usher the Internet into the twenty-first century.

At the October 1995 Networld+InterOp trade show, Apple and Mentat demonstrated a prototype of Internet Protocol Version 6 running on Open Transport. The demonstration showed the flexibility of the Open Transport environment - with current IPv4 applications such as Fetch, Netscape, and Web*Star running unmodified with IPv6 support - and showed the benefits of Open Transport's underlying standards based architecture - facilitating code portability. The demonstration also included basic interoperability testing with IPv6 prototype implementations from DEC and HP, using standard IP utilities such as Ping and Telnet.

Apple and Mentat will continue to work together to ensure timely availability of IPv6 for Mac OS once the standard has been completed.

Question: Will Open Transport v2.0, for the Copland release of the Mac OS, offer any new capabilities?

Answer: Yes. Open Transport v2.0 is being designed to take full advantage of the new microkernel services available in the Copland OS. As a result, Open Transport networking on Copland is planned as a set of multithreaded, preemptively scheduled tasks running in protected memory.

To a user, this will mean that networking will be even more robust and higher performance. To a developer, this will mean that a rogue application running in another memory space will not be able to corrupt system level networking task.

In addition, Open Transport v2.0 is expected to incorporate a second generation update to the human interface introduced with Open Transport v1.0.

Current plans call for this release to include support for features such as:

- Configuration selection will be integrated with system level workspaces and the location assistance toolbox;

- Advanced end-users and network administrators will be able to configure a protocol stack for simultaneous support of multiple network connections (multihoming);
- Administrators will find additional trouble-shooting tools (such as Ping, traceroute, local ARP cache, access to local routing tables, and others) integrated with the configuration utilities;
- Support for AppleScript; and
- Desktop aliases for network configurations to allow double-click reconfiguration of services.

Open Transport 2.0 is also planned to include integrated support for NetWare/IPX, X.25, ATM, and ISDN.

Open Transport 1.1 and Cross-Platform Issues Q & A (3/96)

=====

Article Created: 4 March 1996
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on Open Transport 1.1 and cross-platform issues.

DISCUSSION -----

Question: Will Apple port Open Transport to Windows or UNIX?

Answer: Apple does not plan to port Open Transport to other operating systems. Rather, Open Transport is based on Apple porting three existing, cross-platform industry standards to Mac OS. These standards have their roots in the UNIX community and experienced UNIX network developers will find themselves "right at home" when developing for Open Transport.

Question: What about Windows developers? What about Windows Sockets?

Answer: NetManage, the leading developer of TCP/IP protocols and applications for DOS and Windows, now offers Windows Socket tools for Mac OS, to provide access to Open Transport/TCP and MacTCP services via the Windows Sockets (Winsock 1.1) API.

NetManage's WinSock for the Mac OS is WinSock 1.1 compliant and is being certified by the WinSock Labs operated by Stardust Technologies, Inc., which performs compatibility testing. The SDK for Mac OS costs \$250 per license, with free distribution.

For more information, contact NetManage at +1-408-973-7171.

Question: With both XTI and Windows Sockets available for Open Transport, which API should a developer use?

Answer: The choice of API will depend upon a developer's background, experience, and goals. For developers with a background in UNIX, a need for POSIX compliance, or a need to deploy an application across Mac OS and UNIX systems, XTI is the logical choice. For developers with a background on Microsoft Windows, or a need to deploy an application across Mac OS and Windows, Windows 95, and/or Windows 95 systems, the planned Winsock tools from NetManage will provide an attractive cross-platform alternative.

Apple is committed to XTI and will focus development on transport independence around this API. Mac OS developers now using classic AppleTalk or MacTCP APIs are encouraged to move to Open Transport XTI API.

Open Transport 1.1: Performance Q & A (3/96)

Article Created: 4 March 1996
Article Reviewed/Updated: 8 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on performance for Open Transport 1.1.

DISCUSSION -----

Question: Is Open Transport native on PowerPC Mac OS? Does this make networking faster?

Answer: Open Transport is written to take advantage of the PowerPC processor - it is native code. This provides the necessary foundation for significantly increased networking performance in Mac OS. To realize the performance gains at the application level, however, it is equally important that networking applications also be accelerated for Power Macintosh, and that applications adopt the new Open Transport XTI programming interfaces.

The compatibility services for existing AppleTalk and TCP/IP applications run as 680x0 code in emulation on Power Macintosh. This protects a customer's investment in networking applications, but also obscures - or in some cases, outweighs - the underlying performance increases from the native protocol implementations.

Question: Does Open Transport PowerPC native code include drivers for Macintosh onboard Ethernet?

Answer: PCI Power Macintosh systems ship with a PowerPC native DLPI driver for built-in Ethernet. Power Macintosh 6100, 7100, and 8100 models currently have 680x0 drivers.

Question: Will existing networking applications see performance improvements

with Open Transport on PowerPC Mac OS systems?

Answer: In general, current Mac OS networking applications are written for the 680x0 processor and use the classic networking programming interfaces. These are not likely to see performance boosts with Open Transport, as most of the performance potential comes from the move to native code for the PowerPC processor. Even for PowerPC native applications, use of the backward compatibility libraries offsets most of the performance gains in the low level protocol handling.

Users that select PowerPC native applications that are Open Transport-ready will realize the greatest performance gains. Performance of specific network applications may also be significantly influenced by the underlying processor speed of the system. Customers with demanding, network I/O intensive applications should give strong consideration to the higher performance PowerPC Mac OS systems.

However, even with existing applications using backward compatibility, TCP/IP users are likely to see some performance improvements with Open Transport. This is because of the differences in the way compatibility is provided for MacTCP vs. AppleTalk, and differences in the two protocol architectures.

Question: Will networking applications see performance improvements with Open Transport on 680x0 based applications?

Answer: Not in general, as most of the potential for increased performance with Open Transport comes from the move to PowerPC native code. However, users may find that Open Transport TCP exhibits superior performance to MacTCP, especially under adverse networking circumstances (slow links, lossy lines), due to its more robust implementation and more sophisticated error handling and recovery.

Question: When will new or updated applications that support the native Open Transport APIs become available?

Answer: Applications that are PowerPC native and Open Transport ready are available now. Users are urged to contact the specific third party vendor of interest for more details on their specific products.

Question: How is Open Transport performance being measured?

Answer: Apple has established plans for measuring the performance of Open Transport and related system components through four benchmark test suites:

- SpudPPC - this low-level benchmark tool focuses on measuring the raw throughput potential of Open Transport. It supports both AppleTalk and TCP/IP protocols, is PowerPC native code, and uses Open Transport programming interfaces. Because it measures point-to-point, memory-to-memory data transfers, it most directly measures the performance of Open Transport.

Because this test has the most direct access to Open Transport (the application

layer is "thin"), and because it is fully accelerated for PowerPC, this benchmark will generally indicate an upper bound on the performance potential of Open Transport.

- AppleShare file copy - this end-user benchmark focuses on measuring the throughput of the AppleShare client while drag-copying a file from the Mac OS desktop using the Finder. It is specific to the AppleTalk protocol suite, runs in 680x0 emulation, and depends upon backward compatibility services to access Open Transport networking. Because it measures user-perceived throughput of a complete application chain, this test only indirectly measures the performance of Open Transport.

Because this test depends upon emulated code, backward compatibility, and AppleTalk protocols, this benchmark will generally indicate a lower bound on the performance potential of Open Transport.

- Fetch 3.x - this end-user benchmark focuses on measuring the throughput of the popular ftp client, Fetch. It is specific to the TCP/IP protocol suite, runs as PowerPC native code, and uses Open Transport programming interfaces. Because it measures user-perceived throughput of a complete application chain, this test only indirectly measures the performance of Open Transport.

Because this test is PowerPC native, Open Transport ready, and is based on TCP/IP protocols, this benchmark will generally tend toward the upper bound on the performance potential of Open Transport.

- ZD Labs NetBench 4.0 - this suite of benchmarks is designed to test file server implementations. It is specific to the AppleTalk protocol suite, runs in 680x0 emulation, and depends upon the File System and backwards compatibility services to access Open Transport networking. Because it measures user-perceived throughput of a complete client-server environment, this test only indirectly measures the performance of Open Transport.

Because this test depends upon emulated code, backward compatibility, and AppleTalk protocols, this benchmark will generally indicate a lower bound on the performance potential of Open Transport. However, because it interacts with an AFP server - which may be PowerPC native and Open Transport ready - it can be useful in measuring the multi-client scalability of file server implementations built on Open Transport.

Only a combination of tests can provide good coverage, as user-perceived networking performance is heavily influenced by a combination of a number of Mac OS components including the file system, the Finder, driver code, and the applications used to move data across the network.

Question: How much faster will native Open Transport applications be?

Answer: Networking performance is influenced by many factors. As noted elsewhere in this document, customers will see the highest performance when using PowerPC native applications that fully support Open Transport APIs.

Performance potential will be greater with protocols that use larger datagram

sizes, such as TCP/IP, than with AppleTalk which has a fixed and limited datagram size. On high-speed datalinks such as fast Ethernet, FDDI, or ATM, both the performance of the network interface card (NIC) driver code and the number of allocated buffers are significant factors.

Open Transport has been clocked at over 9.3 Mbps using the SpudPPC tool. A pre-release version of a third party implementation of NFS was benchmarked at over 8.4 Mbps. Both figures approach theoretical maximum performance for 10 Mbps Ethernet.

Question: What about high-speed networking connections like fast Ethernet, ATM, and FDDI?

Answer: Benchmarking on fast Ethernet, FDDI, and ATM datalinks has been underway for some time. Some sample results include:

- 48 Mbps with a Rockwell fast Ethernet card and driver (1500 byte block size)
- 72 Mbps with a Rockwell FDDI card and driver (4K block size)
- 93 Mbps with an Interphase ATM-155 card and driver (8K block size)

These tests were performed using Open Transport/TCP 1.1 beta software, running on a Power Macintosh 9500/132, using the SpudPPC tool. Other tests, such as the one conducted by Fore Systems on their 155 Mbps ATM cards, have shown even higher throughput. In one test, Fore was able to transmit UDP over their LAN-E stack on ATM (using 1500 byte datagrams) at over 100 Mbps.

AppleTalk performance is lower than TCP/IP performance due to the smaller DDP packet size and the ATP retry-acknowledgment algorithm. Current testing on fast Ethernet is turning in figures around 35-45 Mbps with a PowerPC native ATP test tool. This is a significant performance improvement, and further progress should be realized as application code is revised to take full advantage of Open Transport and PowerPC.

Question: Does Open Transport support the use of large datagram sizes? Does datagram size have an impact on network throughput?

Answer: Maximum allowable datagram size is dependent on both the selected datalink and the selected protocol stack. Open Transport supports the use of large datagram sizes as appropriate to the protocol and datalink in use.

Because Open Transport/AppleTalk is based on the Phase 2 architecture, datagram size for AppleTalk is limited to a maximum of 617 bytes. Open Transport/TCP supports larger datagrams; up to 1,500 bytes on Ethernet and fast Ethernet, and up to 16K on Token Ring; even larger block sizes can be used on FDDI and ATM.

Block size does play a role in maximum throughput; the larger the block size used, the greater the potential end-to-end throughput. Users demanding the highest network throughput may find FDDI to be a more attractive alternative than fast Ethernet because it can support larger block sizes at the same bit rate.

Open Transport 1.1: System Requirements Q & A (3/96)

Revised: 3/25/96
Security: Everyone

Open Transport 1.1: System Requirements Q & A (3/96)

Article Created: 4 March 1996
Article Reviewed/Updated: 25 March 1996

TOPIC -----

This article is the Reference Q & A (questions and answers) on system requirements for Open Transport 1.1.

DISCUSSION -----

Question: Which MacOS systems can take advantage of Open Transport?

Answer: Open Transport is designed to work on portable and desktop Apple Macintosh or MacOS compatible computers with a Motorola 68030 or 68040 family microprocessor, or a PowerPC 601, 603(e), or 604 microprocessor.

Apple recommends running MacOS System 7.5.3 with Open Transport, although the earlier System 7.1, 7.1.1 and 7.1.2 releases are also compatible. System 7.5.3 requires a minimum of 4 MB (680x0) or 8 MB (PowerPC) total memory; Open Transport requires a minimum of 5 MB (680x0) or 8 MB (PowerPC).

Systems running Open Transport may be able to benefit from larger than minimum memory configurations when using FDDI or ATM, as these datalinks can provide increased performance by taking advantage of larger datagrams and buffer sizes. Effective use of additional system RAM for buffers is application dependent.

Question: How do settings such as Virtual Memory and RAM disk affect Open Transport's minimum memory requirements.

Answer: Open Transport minimum memory requirements are based on total system memory including VM, less the size of any RAM disk and Disk Cache defined.

Question: How is the Memory Available as reported by the "About this Macintosh..." dialog related to Open Transport's actual memory requirements.

Answer: Open Transport has an entirely different memory management architecture as compared to classic networking in preparation for Copland's protected memory model. In particular, Open Transport supports the dynamic loading and unloading of networking services.

The "About this Macintosh..." dialog reports on both the total free memory and the largest block of contiguous free memory. In practice, the latter figure is a better indicator of whether an additional application can be launched. If a user frequently opens (launches) and closes (quits) multiple applications that use networking services, and if the user has set Open Transport TCP/IP preferences to load networking services only when needed, this can, over time, result in a situation where Open Transport loads into memory "between" other running applications. This "memory fragmentation", in turn, can result in a smaller value reported by "About this Macintosh..." for free contiguous memory. In extreme cases, this could unnecessarily limit the number of concurrent applications that a user could run.

If this situation arises, use the Advanced Mode of the TCP/IP Control Panel to access the Options dialog, and remove the "X" in the "Load only when needed". After restarting the system, Open Transport TCP/IP will load when called on by an application for the first time, but will then remain loaded. This will help avoid the "memory fragmentation" that can occur for these users.

Question: Does Open Transport require more system RAM than classic networking? If so, how much more, and why?

Answer: Open Transport provides many new features and capabilities to MacOS customers and, in general, will require more system memory (RAM) than does classic networking. However, the actual memory requirements of Open Transport are dynamic; they vary depending upon the networking services in use at a given time. This is different from classic networking, which allocates memory to networking services and keeps it allocated even after networking services are no longer in use.

Factors which contribute to differences in memory requirements include:

- Open Transport provides implementations of networking as both 680x0 and native PowerPC code; RISC code is typically larger - but also faster - than CISC programming,
- Open Transport provides "mixed-mode" applications support, making it possible for both PowerPC native and 680x0 applications to use native networking on PowerPC MacOS systems,
- Open Transport includes both the new implementations of networking and the libraries required to provide backward compatibility support for the older AppleTalk and MacTCP programming interfaces,
- Open Transport is very "VM-friendly", and has a lower memory footprint on systems with virtual memory enabled; classic network has about the same footprint regardless of the VM setting,

- Open Transport is based on the cross-platform standard STREAMs environment, which increases the total size of the implementation as compared to the proprietary classic networking implementation, and,
- To lay the groundwork for Copland's protected memory model, Open Transport allocates memory for TCP/IP applications in the system area; MacTCP allocated memory in each application.

Thus the difference in memory requirements will depend upon which configurations are measured. Some examples of base memory requirements include:

- On a PowerPC system with VM on, classic AppleTalk and MacTCP require about 350-450K; Open Transport will require about 200K to load; that is, Open Transport base memory requirements are about 200K smaller.
- On a 680x0 system with VM off, classic AppleTalk and MacTCP require about 350-450K total system memory; Open Transport will require about 700-800K to load; that is, Open Transport is about 350K larger.
- On a PowerPC system with VM off, classic AppleTalk and MacTCP require about 350-450K; Open Transport can require up to 1.2 MB to load, that is, Open Transport is about 800K larger.

Question: Why doesn't Open Transport 1.1 install or work on my Power Macintosh 5200/5300/6200/6300 desktop computer? Wasn't this release supposed to support all PowerPC based MacOS systems?

Answer: Very late in the final quality assurance cycle of Open Transport 1.1, the OT team was notified of a reproducible crash affecting some, but not all, customers with Power Macintosh or Performa 5200/5300/6200/6300 desktop computers. The detailed feedback we received from the OT 1.1b16 Internet-based public preview program helped us understand the extent of the customer impact of this issue.

Rather than delay the release of OT 1.1 and System Update 2.0 (System 7.5.3) further - which both bring many significant improvements to MacOS customers - the Performa, Open Transport, and System 7.5.3 teams working together decided that the best alternative was to disable OT 1.1 on these systems until the problem(s) were fully identified and an appropriate solution could be implemented and tested.

As a part of our ongoing focus on quality and customer responsiveness, Apple had already allocated resources for the possible delivery of a "rapid response" release of Open Transport (v1.1.1) should one be required before the next planned feature release of OT (currently planned as OT 1.5 for calendar Q4 1996).

The plan now in place to address the issue with 5200/5300/6200/6300 desktop computers calls for development and delivery of a modified version of Apple Shared Library Manager (ASLM 2.0.1). ASLM 2.0.1 is planned to accompany the OT 1.1.1 release, expected in approximately 60-90 days (following the release of OT

1.1)

Question: Why specify System 7.5.3 (System 7.5 Update 2.0)? What about System 7.5, 7.5.1, and 7.5.2?

Answer: Open Transport internal and external testing included work with all MacOS system software releases from System 7.1 forward, however, Apple's testing has been most concentrated on System 7.1.x and System 7.5.3.

In moving from earlier versions of System 7.5 to System 7.5.3 a user's system will benefit from a number of updates and bug fixes that while not a part of Open Transport can improve system performance and reliability on the network for a variety of tasks, including printing and file transfers. The combination of the deeper test coverage and the important system updates that are a part of the system software update leads the Open Transport team to overall recommend System 7.5.3.

System 7.1.x users are encouraged to evaluate their needs and to consider updating to System 7.5.3.

Question: Was Open Transport 1.1 released in Japan for System 7.5.2? If so, why isn't this generally recommended?

Answer: Apple did not provide Kanji localized versions of Open Transport 1.0.8; thus, Kanji customers with PCI MacOS systems have not yet been able to benefit from the updates and bug fixes released in OT 1.0.8. Because of the lead times required to localize System 7.5.3 for Kanji, Apple elected to complete the localization and testing of Open Transport 1.1 independently of plans to localize System 7.5.3-J.

This decision resulted in delivery of Open Transport 1.1-J for System 7.5.2-J customers. This is a regional exception to Apple's overall recommendation to use Open Transport 1.1 in combination with System 7.5.3. When KanjiTalk 7.5.3 becomes available, Apple will recommend that all KanjiTalk 7.5.2 customers update to 7.5.3.

Question: Does System 7.5.3 require the use of Open Transport?

Answer: System 7.5.3 supports and includes both classic and Open Transport networking.

Doing an Easy Install of System 7.5.3 on an 68030, 68040, or NuBus PowerPC MacOS system installs Open Transport v1.1 and classic networking. Easy Install on a 68000 or 68020 Macintosh will install only classic networking. Easy Install on PCI MacOS systems will install only Open Transport.

Question: Why does System 7.5.3 include both classic and Open Transport networking?

Answer: System 7.5.3 includes both classic and Open Transport networking to support a Universal System Folder, which could provide networking services for any MacOS system, from the Mac Classic to the most powerful PowerPC.

Question: Since both Open Transport and classic networking are included with System 7.5.3, which network software will actually be used?

Answer: The networking software used by System 7.5.3 depends upon four factors:

- the configuration of the system where 7.5.3 was installed;
- an initial stored preference, established at system software installation time;
- the configuration of the system currently being booted, which might be the same as or different from the system where 7.5.3 was installed; and
- the user's change to the stored preference, if any.

Together these factors determine the networking software system loaded at system startup (boot) time:

- Classic networking will load and run when booting System 7.5.3 on a 68000 or 68020 Macintosh, even if Open Transport is also installed;
- Open Transport will load and run when booting System 7.5.3 on PCI MacOS systems meeting Open Transport minimum memory requirements, even if classic networking is also installed;
- Both classic and Open Transport options are available on 68030, 68040 and NuBus PowerPC MacOS systems meeting Open Transport minimum memory requirements. The networking software used at boot time is selected based upon a stored preference.

When System 7.5.3 is installed on these machines, the initial default is to load and run classic networking. Open Transport can be enabled using the Network Software Selector utility, discussed below.

- Classic networking will load and run when booting MacOS systems with less than 5 MB (680x0) or 8 MB (PowerPC) total system memory.

If this low-memory situation occurs on a 68030, 68040, or NuBus MacOS system, classic networking will load and run, with full support for AppleTalk and MacTCP.

If this low memory situation occurs on a PCI MacOS system - perhaps due to the definition of a large RAM disk - classic networking will become available, but will be limited to support only for AppleTalk on LocalTalk; no TCP/IP services will be available.

Question: What happens if a boot device is moved to a different system after the

preference has been established?

Answer: The stored preference for network software will be honored, if possible, at boot time. Whenever the system configuration being booted meets the minimum requirements for the preferred network software, it will load and run. If the stored preference has been deleted, or is not appropriate for the system being booted, the rules noted above around minimum and recommended memory size, processor, and bus type determine which network software system loads.

Question: Why is the network software preference initially set during system installation time? Wouldn't checking system configuration at boot time be a more flexible way to support the Universal System Folder?

Answer: As described above, a number of system configuration checks are made at boot time - including processor, bus type, and system RAM - and influence the choice of network software when booting a Universal System Folder.

On MacOS systems that support both networking software systems, however, an initial preference is established based on system configuration at installation time. For the majority of users, this system (the installation system) is the same one as where the System Folder being created will be used. In these cases, the update / installation script establishes a preference based on the recommended memory configuration (vs. the minimum required memory, which is still always tested at boot time).

There are two reasons for doing this in this manner:

- Testing for minimum memory requirements at system start-up time assures a compatible hardware-software combination each time a system is booted. If a system configuration changes to fall below Open Transport's minimum memory requirements - which might happen due to reconfiguration, or by moving an external boot device to a different system - System 7.5.3 automatically drops back to classic networking to provide basic connectivity to the outside world.
- When there is no stored preference, System 7.5.3 selects between classic and Open Transport networking based on the system configurations described above. As this check is based on total memory (including VM but less RAM disk), in the absence of a preference, a seemingly unrelated user action such as turning VM on or off could change the network system used at (next) boot time. For example, enabling VM on an 8 MB system would provide at least 9 MB RAM at next startup, moving the system from classic to Open Transport "unexpectedly"; turning on a RAM Disk could cause another reversal. Thus, setting an initial preference "locks in" a predictable behavior.

Question: How can a user specify a preference for a specific network software system, overriding the system installation preference?

Answer: Apple has developed a utility called the "Network Software Selector" (NSS), which allows a user to indicate a preference for classic or Open Transport networking. Network Software Selector is distributed as a part of System 7.5 Update 2.0, and in other System 7.5.3 configurations - it is located

in the Apple Extras Folder.

NSS may not be supplied in all configurations of System 7.5.3; for example, PCI MacOS systems manufactured with System 7.5.3 pre-installed may not have the Network Software Selector utility included, because these systems require Open Transport.

To indicate a preference, the user launches NSS and clicks the radio-button control indicating either classic or Open Transport networking. After quitting NSS, the system must be re-started for the preference to have a change to take effect.

Question: Does the Network Software Selector allow a user to specify a preference for a networking system that is "not valid" for the current system configuration?

Answer: Yes, with the Network Software Selector it is possible to set a preference for classic networking while currently booted on a PCI MacOS system, or to set a preference for Open Transport while booted on a 68000 or 68020 Macintosh. This is designed to allow an administrator to prepare an external boot device with an Universal System Folder that has a configuration different than their own machine.

The Network Software Selector indicates a user preference; the actual network software loaded is determined when the system is booted. If a preference for Open Transport is set but the device is a 68000 or 68020, classic networking would load, ignoring the preference. If that boot volume is moved to a Power Macintosh 9500, Open Transport would load, as this PCI system requires Open Transport. Move the boot volume to a Quadra 800 and restart; Open Transport would load based on the stored preference.

Question: Can the stored preference be deleted? Why might this be a useful action?

Answer: The preference for network software system is stored as a part of the AppleTalk Prefs file, kept in the System Folder. Deleting this file will also delete the stored preference.

In some support environments it may be useful to create a Universal System Folder that does not include a stored preference. For example, if a network administrator's system is configured differently from the systems found with end-users, the preference set at system software installation time (based on the configuration of the administrator's system) may not be optimum for end-users' systems.

If all of the end user population is configured similarly, the network administrator could use the Network Software Selector utility to modify the stored preference before distributing system software. However, if end-users' system configurations vary widely, deleting the preference would have the effect of deferring the selection of network software to boot time for each individual user.

Should an end-user want to "lock-in" a preference for their system, they would need to simply launch and then close the NSS utility on their machine. This records the network system currently in use as the preference.

Question: When might a user want to use NSS to enable Open Transport, disabling classic networking?

Answer: The Network Software Selector provides System 7.5.3 users an easy way to update to Open Transport networking, without requiring custom system software installations.

Open Transport should be enabled when the user is ready to take advantage of any of Open Transport's features, such as multiple saved network configurations, reconfiguration without restart, support for PowerPC native code; when the user want to run Open Transport-ready or Open Transport-enhanced applications; or when a network manager requires the use of Open Transport to connect to a centrally administered network.

Of course, users that have previously dropped back to classic networking in order to maintain compatibility with an older network application will want to re-enable Open Transport once the application has been updated.

Question: When might a user override the default for Open Transport and specify a preference for classic networking?

Answer: The Network Software Selector provides an easy way to temporarily drop back to classic networking, if needed, on systems that support both networking models. There are two reasons why there might be a call to do so:

- a need to maximize RAM available for running applications, especially if VM is turned off; or,
- a need to run older networking software that is not yet Open Transport compatible.

Before dropping back to classic networking, users are encouraged to check with the application developer to find out if an Open Transport-compatible or Open Transport-ready version of the application is available.

Question: On systems that support both classic and Open Transport networking, how are configuration preferences managed? How does the Network Software Selector interact with these preferences?

Answer: When initially installed, Open Transport AppleTalk and TCP Preferences files are created based on the current settings for classic networking. The Prefs files will each contain a single configuration, entitled "Default". Classic settings are not modified by this installation process.

When booted with Open Transport active, classic networking components and

preferences are hidden, and Open Transport initializes with the default configurations. Should the system switch back to classic networking at a later time, Open Transport settings are hidden and the saved classic settings are restored.

Each time the system switches between classic and Open Transport - whether through the use of the Network Software Selector utility or by moving an external boot volume from system to system (where different memory sizes or processor types could cause a switch) - this process will be repeated.

Note that after the initial installation, there is no exchange of configuration information between classic and Open Transport networking. If changes are made in network addressing, and so on while running classic networking, those changes will not be in effect up on switching back to Open Transport. The inverse holds true as well.

For AppleTalk users this would very rarely be any sort of problem, as AppleTalk dynamic addressing and dynamic naming would typically adjust to the system environment at network initialization time.

For TCP/IP users, this could create the potential for some confusion if a user installed Open Transport but continued to run classic networking for a while -- making some configuration changes during that time. Later, when they enable Open Transport networking using the Network Software Selector utility, they'll find that the default Open Transport/TCP configuration reflects their "old" MacTCP settings, not the most recent version.

While there is some potential confusion for users in this behavior, Apple looked carefully at the alternatives, including the possibility of converting information every time the stored preference for network system changed. That approach would have resulted in more frequent and more difficult end-user problems, so was abandoned in favor of the single-conversion at installation time.

Question: On systems that support both classic and Open Transport networking, how are control panels managed? How does the Network Software Selector interact with these preferences?

Answer: During the boot process, a MacOS system running System 7.5.3 checks for the stored preference for networking software as described above. Once the selection of network software has been determined and validated, the load process also causes the appropriate control panels -- "Network" and "MacTCP" for classic networking; "AppleTalk" and "TCP/IP" for Open Transport -- to be "unhidden". Those associated with the disabled network software are hidden.

Question: Does the Network Software Selector allow running Open Transport on a 68000 or 68020 Mac? If not, why not?

Answer: While NSS can change the stored preference to Open Transport at any time, the preference will be honored at boot time only on those models that can use Open Transport - 68030, 68040, and PowerPC MacOS systems.

68000 and 68020 systems always load and run classic networking. Open Transport was not engineered to support these two older processors as the overall processor and system memory requirements associated with Open Transport's additional features are generally higher than that available in these older systems.

Question: Does the Network Software Selector allow running classic networking on a PCI Power Mac? If not, why not?

Answer: While NSS can change the stored preference to classic networking at any time, that preference will be honored at boot time only on those models that can use classic - 68030, 68040, and NuBus PowerPC MacOS systems.

However, certain MacOS systems with PCI -- designed for entry-level markets, where users' networking needs and system memory configurations may be limited -- may ship with a default preference to initially support only AppleTalk on LocalTalk using classic networking. On these systems, a user can easily enable Open Transport using NSS when they are ready to take advantage of PCI network cards, or when they want to gain direct access to TCP/IP networks such as the Internet.

Classic networking is not generally supported on PCI MacOS systems for a number of reasons:

- PCI MacOS systems are based on PowerPC, and only Open Transport provides PowerPC native code;
- Apple simultaneously adopted hardware and software standards for networking by supporting PCI networking via Open Transport's DataLink Provider Interface (DLPI) driver architecture;
- Many of the new features provided by Open Transport, such as multiple saved configurations, reconfiguration without restart, and support for current standards (DHCP, IP multicast, and so on) would have been technically difficult or impossible to retrofit to classic networking; and,
- Open Transport prepares the way for the Copland release of MacOS, by carefully defining an execution model consistent with protected memory and preemptive scheduling.

Question: Can MacTCP be installed on a system running Open Transport?

Answer: With System 7.5.2 it was possible - although not recommended or supported - to install MacTCP on PCI MacOS systems through drag-copy of specific files. Beginning with System 7.5.3, this is no longer possible.

In order to meet the requirements of the Universal System Folder, System 7.5.3 automatically hides files associated with classic networking on systems where Open Transport is in effect (and correspondingly hides Open Transport files on systems where classic networking is running). If a user installs MacTCP on a PCI

machine - where Open Transport is always active - the "just installed" MacTCP files will be automatically be hidden by the MacOS immediately upon reboot of the system. This could be confusing to users who may not be aware that this software configuration (MacTCP on PCI machines) is not supported.

If, for any reason, it becomes necessary to reinstall MacTCP on a 68030, 68040, or NuBus PowerPC MacOS system running Open Transport, the end-user must first use the Network Software Selector utility to specify a preference for classic networking and reboot the system. Only after the reboot will MacTCP and the other components of classic networking be visible. The converse would also be true for Open Transport on these machines - only the currently running network system is visible and can be modified or updated.

Question: Does System 7.1.x support both classic and Open Transport networking?

Answer: System 7.1.x continues to support classic networking, and gains the option of running Open Transport v1.1.

Customers running 7.1.x on 68000 and 68020 systems will continue to use classic networking; Open Transport v1.1 will not install on these systems. (System 7.1.x does not support PCI MacOS systems.) Customers running System 7.1.x on 68030, 68040, and NuBus PowerPC MacOS systems can use either classic or Open Transport networking. To enable Open Transport, users must run the Open Transport installer, available as a part of the stand-alone retail distribution package.

Question: Is the Network Software Selector available for System 7.1.x customers?

Answer: No, the Network Software Selector is a feature only found in System 7.5.3.

Color StyleWriter 2200: White Lines at Bottom of Page (3/95)

Revised: 3/4/96
Security: Everyone

Color StyleWriter 2200: White Lines at Bottom of Page (3/95)

=====

Article Created: 4 March 1996

TOPIC -----

White horizontal lines appear when I print full page documents on my Color StyleWriter 2200. The lines only seem to appear during the last 0.8 inches at the bottom of the page. Is this normal?

DISCUSSION -----

White horizontal lines may appear when printing near the bottom 0.8 inches (2.03 cm) of each page because the majority of the paper has left the printer, leaving very little contact area with the paper feeding rollers. When this occurs, the paper can shift or advance slightly causing white gaps or lines.

The ReadMe file provided with each Color StyleWriter 2200 makes the following recommendations:

- If you see very thin stripes near the bottom of your printout, use your application program to make your bottom margin larger. A bottom margin of 0.8 inches or greater is best.
- For best results when printing envelopes, do not put images or text along the bottom edge of the envelope.

QuickTime Conferencing: Included Compression Codecs (3/96)

Revised: 3/7/96
Security: Everyone

QuickTime Conferencing: Included Compression Codecs (3/96)

=====

Article Created: 5 March 1996
Article Reviewed/Updated: 7 March 1996

TOPIC -----

What compression codecs are included with the H.320 ISDN QuickTime Conferencing Kit? What are their compression ratios?

DISCUSSION -----

For the H.320 QuickTime Conferencing kit, the only supported codecs when using the ISDN portion are H.320 and it's related codecs. For non-ISDN connections, we support some of the QuickTime compressors.

Audio

- G.728 - 16 Kbps digital audio samples 3.3 KHz of analog audio (low bandwidth)
- G.722 - 48, 56, or 64 Kbps PCM digital audio from 7 KHz analog audio (higher bacndwidth)

Video

- H.261
 - QCIF 176x144 pixels
 - CIF 352x288 pixels

Because there is no penalty for choosing the larger resolution, you should always select it for the best resolution on the receiving end. Also, in Apple Media Conference during an ISDN connection, you can double the CIF window <which is actually 320x240 on your screen> to achieve a 640x480 image size. Keep in mind that it uses pixel doubling, so resolution will suffer slightly.

For an ISDN connection, you can get 12-15 fps in the large window (320x240) if using both B channels. Otherwise, you can get 5-7 fps when using one B channel. Frame rate will vary depending on which audio compressor is being used and

whether or not you are sharing data in the shared window. For a single B channel connection, you can only use the G.728 audio compressor if you expect to get video, because there is no bandwidth left with G.722.

QuickTime Conferencing: Broadcasting Over Network (3/96)

Revised: 3/5/96
Security: Everyone

QuickTime Conferencing: Broadcasting Over Network (3/96)

=====

Article Created: 5 March 1996

TOPIC -----

I would like to use the QuickTime Conferencing kit across our campus Ethernet network. Are there any special configurations we must do to our network?

DISCUSSION -----

If you are planning to broadcast across the campus network, you need to verify that all network routers, repeaters, and so on are multicast capable. (Note that this is not an issue for conferencing.) If they are not, you will need to check with the vendors of the equipment to see if an upgrade is available. Multicast allows a single packet to travel across the network and any entity can listen to that broadcast. In a non-multicast environment, each receiving entity will create a single point-to-point connection with the broadcaster. This creates more network traffic and results in fewer frames of video and audio packets getting through and far fewer people would be able to receive or view the broadcast.

QuickTime Conferencing: Using Over the Internet (3/96)

Revised: 3/5/96
Security: Everyone

QuickTime Conferencing: Using Over the Internet (3/96)

=====

Article Created: 5 March 1996

TOPIC -----

I would like to use QuickTime Conferencing to connect our university with other college campuses over the Internet. What compression rates are needed to get 7 frames per second (fps) across the Internet?

DISCUSSION -----

This will depend heavily on your network infrastructure and how much traffic currently exists on it. The default settings on the QuickTime Conferencing software are considered to be the best optimized settings for that particular network type. The default settings for IP include the JPEG compressor in the small window (120x80) and the frame rate is set to 10 fps. Keep in mind, however, that the frame rate is what QuickTime Conferencing will attempt to achieve. There is no assurance that it will be reached. If you have a fast Internet connection, this rate is more likely. You should test during peak and non-peak load periods to see what is possible on your network.

Color OneScanner 600/27: Chattering Sound due to Lock (4/96)

Revised: 4/30/96
Security: Everyone

Color OneScanner 600/27: Chattering Sound due to Lock (4/96)

Article Created: 5 March 1996
Article Reviewed/Updated: 29 April 1996

TOPIC -----

When I power on my Color OneScanner 600/27, I get a chattering sound and it will not scan. What is wrong?

DISCUSSION -----

The Apple Color OneScanner carriage is locked during shipment. The scanner will not work if the carriage is locked. The Color OneScanner software displays an error message telling you to make sure the scanner is unlocked and turned on if you try to scan when the scanner is locked.

Note:

The Color OneScanner 600/27 does not always make a chattering sound when it is locked. Sometimes no sound is heard but the scanner carriage still does not move.

Unlocking the Color OneScanner

Step 1

Grip the scanner top cover on both sides and lift it off.

Step 2

Use a coin or flat-blade screwdriver to turn the lock, located at the top of the scanner glass, to the unlocked position. You need to turn the lock 90 degrees.

IMPORTANT: A small arrow on the lock's plastic dial (NOT the slot used to turn the dial) indicates the position. The arrow needs to point to the unlocked (open) position for the scanner to operate.

Step 3

Replace the scanner top cover.

If you ever need to ship the scanner somewhere or move it to a different place, you should relock the scanning unit so the arrow points to the locked (closed) position.

Color OneScanner 600/27: Scanner Driver isn't Initializing (3/96)

Article Created: 5 March 1996
Article Reviewed/Updated: 13 March 1996

TOPIC -----

I have an Apple Color OneScanner 600/27, and when I try scanning with the Dispatcher software I get an error message. The error message reads "Unable to initialize the scanner driver. Either the scanner is not turned on, connected, or already in use by another application." What is wrong?

DISCUSSION -----

The most common cause is the Apple Color OneScanner was powered ON after the Macintosh computer. Always make sure you power on the scanner before you power on your Macintosh computer, so the scanner driver loads properly.

How To Determine The Scanner is Recognized

Observe the extensions and control panels as the Macintosh starts up.

An icon which shows a side view of a scanner should appear. This is the Apple Color OneScanner 600/27 software driver loading.

If the scanner extension does not appear, reinstall the Color OneScanner software.

If the scanner extension appears with an 'X' through it, you need to check your SCSI connection. Check both the SCSI ID and SCSI cables. The Tech Info Library article titled "System 7.x: Troubleshooting Startup Problems" can help you further isolate SCSI related issues.

Color OneScanner 600/27: Scanned Image Too Large (3/96)

=====

Article Created: 6 March 1996
Article Reviewed/Updated: 12 March 1996

TOPIC -----

When I scan images using my Apple Color OneScanner 600/27, the image is too large to see on my monitor. How can I view the entire image?

DISCUSSION -----

If you have scanned an image at 300 dpi, it will be shown initially at four times its printing size because of the pixel-for-pixel view. The images are not dynamically sized for the size of your monitor.

Here are some tips that can help you when you scan at high resolutions.

- Use PRESCAN and select only the area you need scanned before performing a scan.
- If you are using a Multiple Scan Display, change the Resolution before launching the OneScanner Dispatcher software.
- Once the image has been scanned, zoom out until you can see the entire image on your display.

Color OneScanner 600/27: Straighten feature Requirements (3/96)

Article Created: 6 March 1996
Article Reviewed/Updated: 12 March 1996

TOPIC -----

The straighten feature in Apple Color OneScanner Dispatcher software does not seem to work.

DISCUSSION -----

The straighten feature relies on well-defined, high-contrast, rectangular edges on the scanned document, as well as some image content, to determine the correct rotation required to straighten the image. This function also expects the scanned document to be located away from the edges of the scan window.

You have the option of manually rotating an image, if the automatic straighten feature is not working as well as you want. To manually rotate an image, use the Rotate, Arbitrary command in the Image Editor.

Color OneScanner 600/27: SCSI Selector Has Wrong SCSI ID (3/96)

Article Created: 6 March 1996
Article Reviewed/Updated: 12 March 1996

TOPIC -----

The SCSI Select switch on my Apple Color OneScanner 600/27 does not select the correct SCSI ID according to the SCSI Probe software.

DISCUSSION -----

Sometimes the label on the Apple Color OneScanner 600/27 is not lined up correctly to the position of the SCSI selector switch. To correctly set the SCSI ID, turn the selector switch so the arrow is pointing up (the 12 o'clock position). Next turn the selector to the right (clockwise) and count the number of times the selector clicks. This allows you to set the proper SCSI ID.

For example, if you rotate the SCSI selector three notches, this is SCSI ID 3.

End_Table

*NOTE: The Macintosh Performa 6400/200 computer that includes an internal Zip drive supports EDO memory.

```

+=====+
| Fast-Paged Mode Memory |
+=====+

```

A specific location in a memory chip is identified by the row and the column addresses. Each time memory is accessed, the memory controller first supplies the chip with the row address and then the column address. After the information obtained from these locations is validated, the column deactivates and gets ready for the next cycle. This introduces a wait state because nothing is happening while the column is deactivating. The processor must wait for the memory to complete the cycle.

The Fast-Paged Memory (FPM) chip decreased the time required to read these addresses by allowing the memory controller to select a particular row and then access the corresponding column addresses for that row. This process works under the assumption that the next piece of data needed is in the memory location adjacent to the previous piece. Because the row address is only set up once and only the column address changes, this saves time when reading or writing information to or from memory.

Using FPM memory in Power Macintosh computers

=====

Most Power Macintosh computers support Fast-Paged Mode Memory. The only exceptions are the Power Macintosh 4400, 5500, and 6500 series computers.

```

+=====+
| EDO Memory |
+=====+

```

EDO (Extended Data Out) DRAM is a subset of FPM memory that saves the memory

controller even more time by allowing it to begin locating the row and column for the next address, while reading the data at the first address. It is able to do this because EDO memory keeps the output buffer on while preparing for the next read operation. By keeping the buffer on, EDO eliminates wait states. This speeds up data transfer rates since EDO RAM can access data continuously without waiting for addresses to be located. This reduces the time of the read cycles by approximately 10%. However, during write cycles, the system behaves exactly as an FPM chip would behave.

Although EDO devices improve timing efficiency to main memory by approximately 10%, it does not necessarily mean programs will execute 10% faster. The processor often gets instructions and data from cached memory, for example, L1 cache within the PowerPC microprocessor and or L2 cache on the logic board.

Using EDO memory in Power Macintosh computers

=====

Because EDO DRAM is a subset of FPM memory EDO DRAM can typically be used in place of Fast Page Mode DRAM. However, unless the memory controller is designed to use the faster EDO timing, the memory performance will be the same as Fast Page Mode.

There are three categories of Power Macintosh computers based on their level of EDO memory support. In some Power Macintosh computers, you can use EDO memory and get some potential performance boosts. In others, you can use EDO memory even though you will not derive any benefits from doing so. Finally, there are some Power Macintosh computers in which Apple does not recommend using EDO memory because doing so may damage your computer.

Power Macintosh Computers that Support EDO Memory

The following Power Macintosh computers fully support EDO memory and may experience increased performance:

- Power Macintosh 4400 series
- Power Macintosh 5500 series
- Power Macintosh 6500 series
- Macintosh Performa 6400/200 with internal Zip drive

All memory installed must be EDO to take advantage of the benefits. If you mix FPM and EDO RAM, the EDO modules will perform as if they were FPM.

IMPORTANT: There are two types of EDO memory--5 Volt and 3.3 Volt. The Power Macintosh 4400 series requires 3.3 Volt EDO memory whereas the Power Macintosh 5500, 6500, and 6400 computers require 5 Volt EDO. The two types of EDO memory are NOT interchangeable. Most 5 V and 3.3 V EDO memory are physically keyed differently to prevent you from using the wrong type, but even if the DIMM can be installed, verify that you are installing the correct type.

Additionally, EDO memory can also be used as video memory in the Power Macintosh 4400 ONLY. However, when using EDO memory as video memory, the Power Macintosh 4400 uses 5 Volt EDO memory rather than the 3.3 Volt used as DRAM.

Power Macintosh Computers that Can Use EDO memory

Although you will not derive any performance benefits by using EDO DIMMs, you can use them in the following Power Macintosh computers:

- Power Macintosh 6100 series
- Power Macintosh 7100 series
- Power Macintosh 8100 series
- Power Macintosh 5200 series
- Power Macintosh 5300 series
- Power Macintosh 5400 series
- Power Macintosh 6200 series
- Power Macintosh 6300 series
- Power Macintosh 6400 series
- Power Macintosh 7500 series
- Power Macintosh 7600 series
- Power Macintosh 8500 series
- Power Macintosh 9500 series
- Macintosh Performa 6360 series
- Some Macintosh Performa 6400 series

Power Macintosh Computers that CANNOT use EDO memory

You cannot use EDO DIMMs in the Power Macintosh 7200 computer. Using EDO memory in the Power Macintosh 7200 computer can cause damage to the logic board and to the DIMMs. Because of this, Apple does not support using EDO memory in the Power Macintosh 7200 computer. Any damage incurred from using EDO memory in the Power Macintosh 7200 computer may not be covered under Apple Computer's limited hardware warranty.

EDO RAM has not been tested, and has not been certified or is supported by Apple in the Workgroup Server 9150/xx series computers.

+====++
| SDRAM |
+====++

The processes performed by a computer are coordinated by an internal clock, but memory access has traditionally used its own fixed timers for reading and writing data. Rather than synchronizing its actions with those of the internal clock, memory access had set times for reading and writing data regardless of the actual time the processes required. This would sometimes result in periods of wait cycles where nothing was happening. Because of this, memory was considered to be "asynchronous".

However, Synchronous Dynamic Random Access Memory (SDRAM) eliminates this difference between memory speed and processor speed because SDRAM has a clock synchronized with the computer's central processing clock. Thus, SDRAM uses only the time required to read/write data which increases data transfer rates by eliminating non-productive periods of waiting. The clock coordinates with a computer's central processor's clock so that data can be delivered continuously to the microprocessor. The timing coordination between memory, the microprocessor, and other support chips permits more efficient memory access and

eliminates wait states. This results in memory access speeds of up to 20% faster than EDO.

Using SDRAM memory in Power Macintosh computers

=====

Only the Power Macintosh 4400/200 series support the use of SDRAM. Additionally, SDRAM is supported in these computers ONLY for video memory. You cannot use SDRAM as the primary memory devices on the logic board. The Power Macintosh 4400 series includes 2 MB of EDO memory for video memory, but it supports up to 4 MB of SDRAM or SGRAM.

+=====+

| SGRAM |

+=====+

Synchronous Graphics Random Access Memory (SGRAM) functions similarly to SDRAM except that it has added graphics support. Graphics support is provided by adding block write and masked write (or write-per-bit) functionality.

Block write enables the graphics engine to do block transfers of graphical data, such as tiling, and to interpret these larger data packets. Block write is often used in 3-D operations to clear the buffers or to prepare them for new rendering. With the block write function in the graphics memory, the graphics engine is free to do other tasks which increases performance. Masked write simplifies changing selected bits in a block of data. Masked write increases graphics performance with tasks such as color management of the display.

Using SGRAM memory in Power Macintosh computers

=====

SGRAM is supported in the Power Macintosh 4400, 5500, and 6500 series. SGRAM is supported in these computers for video memory ONLY; you cannot use SGRAM as the primary memory devices on the logic board.

The Power Macintosh 4400 series includes 2 MB of EDO memory for video memory, but it supports up to 4 MB of SDRAM or SGRAM. However, the Power Macintosh 5500 and 6500 series computers include 2 MB of SGRAM, which is NOT expandable.

This article was published in the Information Alley on 24 June 1996.

System 7.5 Update 2.0: FAQ - General Info (1 of 6) (8/96)

=====

Article Created: 7 March 1996
Article Reviewed/Updated: 12 August 1996

TOPIC -----

This article provides the answers to commonly asked questions about System 7.5 Update 2.0. Specifically, this article provides general information about the update.

DISCUSSION -----

General Information
=====

1) What is System 7.5 Update 2.0?

Apple's System 7.5 Update 2.0 is a comprehensive set of system software enhancements designed to provide new functionality and enhanced system performance. At the same time, it significantly improves the overall reliability of Macintosh and Mac OS-compatible systems running System 7.5, 7.5.1, or 7.5.2. Some of the changes in this update affect all Macintosh computers; others are specific to certain models. For example, all Macintosh computers should see a performance boost while the Finder is copying large numbers of small files. More specifically, this update has additional PowerPC native system software components. With this release, Apple has also created a "standardized" version of System 7.5 (officially known as System 7.5.3) that incorporates the enhancements from our last update (System 7.5 Update 1.0, released in March 1995) and will run on every properly configured Macintosh from the Macintosh Plus to the new PCI-based Power Macintosh 9500.

With System 7.5 Update 2.0, you can now create a System Folder that can be used on all currently supported Macintosh computers. You can set up a single external hard disk or removable-media drive that can boot up everything from a Macintosh Plus to a Power Macintosh 9500. We've also streamlined the System Folder, consolidating more than 20 files introduced in previous versions of System 7.5.

In response to requests from customers and developers, System 7.5 Update 2.0 contains a number of system reliability improvements, such as a reduction in the occurrence of Type 11 errors on Power Macintosh computers; corrections to the General Controls control panel to eliminate conflicts with some third-party products; and proper handling by the Installer of control panels and extensions disabled using the Extensions Manager. System 7.5 Update 2.0 also integrates a new version of Open Transport (version 1.1) that offers better performance on high-speed networks; broader support for dial-up connectivity to TCP/IP networks and the Internet; and new support for most 68030, 68040, and NuBus Power Macintosh computers. In addition, large PowerPC native applications—running on PCI-based Macintosh computers with virtual memory turned on—will launch significantly faster than before. System 7.5 Update 2.0 also integrates the "7.5.2 Printing Update" for PCI Macintosh computers (including the 7200, 7500, 8500, and 9500), as well as the recently released update for the Apple PowerBook 5300.

2) Why should I install this update?

Any customer using any version of System 7.5 (7.5, 7.5.1, or 7.5.2) will realize a benefit from the installation of this update. Improvements in overall system software performance and stability should be important to all users of Macintosh computers. System 7.5 Update 2.0 delivers significant improvements in both of these areas.

3) How does System 7.5 Update 2.0 fit into Apple's vision and strategy for the Mac OS?

System 7.5 Update 2.0 is part of Apple's strategy to address the evolving needs of our customers with regular system updates. This update is actually the fifth that Apple has made to its system software (with the first three updates for pre-System 7.5 software), which demonstrates that Apple has an established track record for providing updates. Our intent is to provide key updates every six to twelve months, so our customers do not have to wait for major revisions of the Mac OS in order for Apple to respond to their needs.

4) Is Apple planning any further development for System 7.5?

Yes, we will continue to maintain and enhance System 7.5 for as long as it makes sense for our customers, our developers, and Apple.

5) How compatible is System 7.5 Update 2.0 with existing applications and extensions?

In addition to the extensive testing done by Apple with this update, Apple has had a very aggressive developer seeding program to get the software into the hands of many developers well before it's shipped. This effort started last summer and more than 800 developers have been actively involved. Apple has also encouraged a number of our customers to test this software and provide feedback. We don't expect any significant compatibility problems with this update. If

there are problems with any particular application, extension, control panel, or driver, our developers should be prepared to assist their customers with them.

6) Will all of the improvements in System 7.5 Update 2.0 be incorporated into the existing System 7.5 retail product?

Apple plans on updating our retail product with this latest version of our system software in the U.S. in the spring of 1996. This software release is expected to be localized by most countries within months after the U.S. introduction.

7) Why is System 7.5 Update 2.0 so large?

At 14 disks, System 7.5 Update 2.0 may surprise customers because it is significantly larger than previous system software updates. There are good reasons for this. This update delivers several hundred stability improvements based upon customer and developer feedback. It also provides a number of performance improvements and includes all of the enhancements from System 7.5 Update 1.0. Finally, System 7.5 Update 2.0 includes updates to many Apple technologies, including Open Transport, PlainTalk, QuickTime, Apple Guide, and Desktop Printing.

8) What will System 7.5 Update 2.0 replace within my System Folder?

Generally speaking, any component in your System Folder will be replaced if a newer version is being delivered with this update (assuming you use the "Easy Install" option when you update your system). Since system components vary depending on the computer you're using, the components that are replaced with the update will also vary. If you're interested in the details of what this update is changing in your System Folder, you'll want to read the New In This Update documents that ship with the update. Since System 7.5 Update 2.0 is delivering so many changes, you'll find that most of the components within your System Folder will be updated.

9) Is System 7.5 Update 2.0 an Apple response to Microsoft Windows 95?

No. System 7.5 Update 2.0 is a response from Apple to requests received from customers and developers for improvements to System 7.5. It is expected to significantly improve our customers' experience using our operating system. The Mac OS has many advantages over competitive operating systems such as Windows 95 (see the document titled Top 10 Macintosh Advantages), and any enhancements we make to System 7.5 will only improve this position.

10) Can this System 7.5 Update 2.0 be installed on Mac OS compatibles?

Yes. Should any telephone support be needed after System 7.5 Update 2.0 is installed, however, the customer or user must contact the company that manufactured their Mac OS compatible computer for support-related questions.

11) Which Macintosh computers will ship with System 7.5.3?

Apple will begin shipping some computers with System 7.5.3 domestically in the spring of 1996. From that point forward, we'll increase the types of computers that ship with this system software release, and start shipping computers with it in other countries.

12) Which countries are expected to introduce System 7.5 Update 2.0, and when will this occur?

Generally speaking, within 60 days after the update is released in the U.S., a localized version will be available in most major languages in North America, Europe, and Australia. Other regions will provide the improvements that are delivered in this update at a later date. Please contact the Apple Assistance Center in your area for details.

13) After installing this update, which version number of System 7.5 will I have?

Once you've completed the installation process, go to the About This Macintosh item on the Apple menu. When the window appears, you should see System Software 7.5.3 with System 7.5 Update 2.0 directly beneath it.

14) I have a PCI-based Macintosh running System 7.5.2 and am connected to a Novell Netware network. Is there anything I should be aware of before installing System 7.5 Update 2.0?

System 7.5 Update 2.0 contains the Ethernet Compatibility extension version 1.0.3, which fixes a problem in the system shutdown code. A side effect of this fix is a two-minute delay in shutting down the computer. It may appear that the machine has hung, however after two minutes, the machine will resume the shutdown process. This delay can be avoided by logging out of the Netware tree before shutting down or restarting.

Without the Ethernet Compatibility extension, when a PCI-based machine (including the 7200, 7500, 8500, and 9500) running System 7.5.3 selects Shut Down or Restart, the machine would crash.

To use the Ethernet Compatibility extension, you must custom install the Ethernet Driver Update. This can be done by opening the System 7.5 Update 2.0 Installer, selecting Custom Install in the upper pop-up menu, and selecting the Ethernet Driver Update. This selection is at the very bottom of the list of custom install options.

System 7.5 Update 2.0: FAQ-Benefits&Improvements (2 of 6) (8/96)

Article Created: 7 March 1996
Article Reviewed/Updated: 12 August 1996

TOPIC -----

This article provides the answers to commonly asked questions about System 7.5 Update 2.0. Specifically, this article provides information about the key features and benefits, system software stability improvements, and performance improvements included with the update.

DISCUSSION -----

Key Features and Benefits
=====

1) Will System 7.5 Update 2.0 include any new features?

There are a number of new features that System 7.5 Update 2.0 delivers. One feature that is especially important to large business and education customers is the ability to create a universal System Folder. This will allow creation of a System Folder that can boot any system from a Macintosh Plus to currently shipping systems. These features are described in detail below.

- There is a space for you to put comments in a text window when you select "Get Info" from the File menu in the Finder. With this update, these comments are retained after rebuilding the desktop file.
- For Power Macintosh systems, when a file is dragged from within the Finder, the icon is now translucent instead of a simple outline. This will allow customers to better see what they are moving.
- A few changes have been made that affect components in the System Folder. A number of components in the System Folder have been consolidated into other pieces. In addition, Apple is providing documentation that will describe the Apple system software components in the System Folder, Control Panels folder, and Extensions folder. After System 7.5 Update 2.0 has been installed, these

will be located in the What's in Mac OS Folders? in the Apple Extras folder. For more information on new features provided with this update, please refer to the documents distributed with the update entitled New in this Update.

2) What is a "universal" System Folder and how can I create one?

With System 7.5 Update 2.0, you'll be able to create a universal System Folder that can be used to start up all currently supported Macintosh computers—from the Macintosh Plus to all Power Macintosh, PowerBook, and Performa computers shipping today. Support professionals responsible for a variety of Macintosh computers find it very useful to create a universal System Folder on an external drive. They can then use this drive to boot any of the systems they support. Directions on how to create a universal System Folder are included with System 7.5 Update 2.0 in the document titled Installing This Update. To create a universal System Folder, you'll need the original version of System 7.5 and System 7.5 Update 2.0.

3) Is there anything in this update to reduce the number of files in the System Folder?

More than 20 items have been eliminated from the System Folder (the actual number will vary depending on which Macintosh it is installed). Several stand-alone files are now merged into the System 7.5 or 7.5.2 Update enabler. In addition, several stand-alone files have been merged into, or been replaced by, various other system components. For more details, please refer to the New in This Update documents included with the update.

4) Will this update install anything new on my computer?

Yes. Two system software technologies—PlainTalk and Open Transport—are included in this update. The "Easy Install" option will install them onto your system if they are not already installed. We believe our customers want these technologies, so we've made them readily available. If you don't want these technologies active because of concerns of performance or RAM requirements, there are very simple ways to disable them. These are clearly described in the Installing This Update document that is included with the update.

5) Will this update allow other types of computers to access data on hard drives that are larger than 4GB?

Prior to the release of System 7.5 Update 2.0, only PCI-based Macintosh systems had the ability to read and write on hard drives that have more than 4 GB per volume. This is not changed with System 7.5.3.

System Software Stability Improvements =====

1) What are some of the major bugs addressed with this update?

While there are several hundred bugs addressed with this update, a few key ones are worth highlighting. For details on which bugs have been addressed, please

refer to the document titled New in This Update distributed with the update. Some causes of Type 11 errors have been eliminated for Power Macintosh computers. In addition, several months ago, Apple published a Tech Note to our developers describing in detail many of the causes of Type 11 errors. This will help them write applications that are less prone to cause this type of error.

We believe these two actions will go a long way toward significantly reducing Type 11 errors, but some of the results may take a while to be seen by our customers. Apple has also improved the memory management so that customers are less likely to get out-of-memory errors. Corrections have been made to the General Controls panel to eliminate conflicts with several third-party products.

The Update Installer has been fixed so that control panels and extensions that were disabled using the Extensions Manager get properly updated. Many of the printing problems that were associated with PCI-based Macintosh computers (including the 7200, 7500, 8500, and 9500) have been addressed (these are the same improvements delivered with the 7.5.2 Printing Update).

2) Is the 7.5.2 Printing Update included with this update?

Yes. All of these components are automatically installed if "Easy Install" is chosen when you install the update. However, we've integrated some of these components into other parts of the system software, so you may not see the same components in your System Folder after you install the update.

Performance Improvements =====

1) What type of performance improvement can I expect from System 7.5 Update 2.0?

Overall, the performance improvement you can expect to receive from System 7.5 Update 2.0 will depend on the Macintosh computer it's being installed on. Performance will range from no significant improvement to a modest improvement. Customers with Power Macintosh systems will generally see more improvement in performance.

2) Are launch times for large applications, with virtual memory turned on, improved with System 7.5 Update 2.0 for PCI-based Macintosh computers. If so, how much of an improvement?

We worked very closely with some of our key developers (most notably Microsoft) to identify the areas where we could improve the launch times for some applications with virtual memory on specific systems. Some of the testing we've seen indicates that launch times for large applications with virtual memory on for PCI-based Power Macintosh computers (including the 7200, 7500, 8500, and 9500) is several times faster. Other Macintosh computers will not experience this improvement.

3) Will Apple ship the new Dynamic Recompiling (DR) emulator, which first shipped with the PCI-based Macintosh computers with System 7.5 Update 2.0?

Yes. However, this feature is still only available for PCI-based Macintosh computers (including the 7200, 7500, 8500, and 9500). It could not be delivered with this update for other Macintosh computers in a way that would meet our performance and RAM requirements. We will, however, evaluate making this feature available for other Macintosh computers in future system software releases.

4) I recently installed the PowerBook 5300 System Software Update. Should I also install the System 7.5 Update 2.0?

For customers who've installed the PowerBook 5300 System Software Update, the improvements delivered with System 7.5 Update 2.0 are not considered by Apple to be significant enough to recommend that it be installed by all customers. The vast majority of the improvements delivered with System 7.5 Update 2.0 are already included with the PowerBook 5300 System Software Update. There may be enough new benefits in System 7.5 Update 2.0, however, for some customers to consider installing it. It's important for customers to understand that after installing the PowerBook 5300 System Software Update, the system software version will be 7.5.2. After installing System 7.5 Update 2.0, the system software version will be 7.5.3. This may be important to organizations that want all of their systems on the same system software version, or for customers who simply want the latest version.

System 7.5 Update 2.0, includes the PowerBook 2300c Update 1.0, Open Transport v1.1, the Network Software Selector (to switch between classic AppleTalk and Open Transport), a new version of Apple Menu Options, a few minor improvements to the Finder, and several other minor improvements in stability. In addition, the RAM required for System 7.5 Update 2.0 is slightly higher than for systems with the PowerBook 5300 System Software Update installed.

Some third-party PC card Ethernet drivers have not yet been optimized for use with Open Transport. Customers may encounter configurations where classic AppleTalk performs better than Open Transport AppleTalk. The Network Software Selector provides a convenient mechanism for these customers to upgrade to Open Transport when they receive an Ethernet driver update.

System 7.5 Update 2.0: FAQ - Open Transport (3 of 6) (11/96)

=====

Article Created: 7 March 1996
Article Reviewed/Updated: 25 November 1996

TOPIC -----

This article provides the answers to commonly asked questions about System 7.5 Update 2.0. Specifically, this article provides information about Open Transport.

DISCUSSION -----

Open Transport
=====

1) What is Apple Open Transport and how does it benefit users?

Apple Open Transport is the modern networking and communications subsystem for the Mac OS. Open Transport is based on industry standards and brings a new level of networking connectivity, control, and interoperability to Mac OS- based systems, while preserving and enhancing the hallmark of Macintosh computers: built-in, easy-to-use networking. Open Transport provides individual computer users with many benefits. Two of the most immediately visible and important benefits relate to making networking more accessible. First, Open Transport makes it easy to switch from one network configuration to another. A computer user "on the go" might want to hook up to the Internet in various locations, each requiring a different network configuration. With Open Transport, settings for each network location can be stored for easy access. Changed configuration settings are available immediately; no reboot of the computer is required to use them. Second, Open Transport integrates on-line help-based on Apple Guide technology-to make it easier for an individual to hook up to a network, with fewer demands on network manager and support resources. Lastly, some customers, primarily those using Power Macintosh computers, will see an improvement in networking performance by upgrading to Open Transport.

2) What Mac OS technologies, components, and products will Open Transport

replace?

When installed, Open Transport replaces the current Mac OS implementations of AppleTalk and TCP/IP (including the protocols and the Network, MacTCP, and Admin TCP control panels). Open Transport is also designed to replace the Connection Manager and the Communications Resource Manager of the current Communications Toolbox architecture. Over time, Open Transport is planned to replace the "AppleTalk Connection for Macintosh" and "TCP/IP Connection for Macintosh" shrink-wrap software products.

3) How would a user establish a preference for a specific network software system after installing System 7.5 Update 2.0?

As a part of this update, Apple supplies a utility called the "Network Software Selector." This utility allows a user to indicate a preference for classic or Open Transport networking, if different from the default choice that would otherwise be made by the system. The Network Software Selector utility is located in the Apple Extras folder.

4) Why does System 7.5 Update 2.0 include classic and Open Transport networking?

System 7.5.3 (the version delivered in System 7.5 Update 2.0) includes both classic and Open Transport networking in order to support a universal System Folder—on, for example, an external hard drive—that can be booted and provide networking services for any Macintosh from the Macintosh Classic to the most powerful Power Macintosh computer.

5) When might a user want to override the default selection of Open Transport, and specify a preference for classic networking?

The Network Software Selector provides an easy way to temporarily drop back to classic LocalTalk networking, if needed, on computers that support both networking models. Here are two reasons why there may be a need to do so:

- A need to maximize available system RAM; which may possibly be an issue in systems with less than 8 megabytes of memory—especially when virtual memory needs to be turned off for some reason.
- A need to run an older networking application that is not yet Open Transport-compatible. Before dropping back to classic LocalTalk networking, users are encouraged to check with the application developer to find out if an Open Transport-compatible or Open Transport-ready version of the application is available.

6) When this update is installed, will I get Open Transport AppleTalk or classic AppleTalk?

System 7.5.3 supports both classic and Open Transport networking. Completing an

"Easy Install" of System 7.5 Update 2.0 on a 68030, 68040, or PowerPC-based Macintosh automatically installs Open Transport v1.1. The networking software used when a system starts up depends upon the specific Macintosh computer being booted, the amount of system memory available, and the user's specified preference (if any).

- If a customer was using classic networking before installing the update, the networking software that will be active after rebooting the system will still be classic networking.

- If a customer was using Open Transport before installing the update, the networking software that will be active after rebooting the system will still be Open Transport.

- Classic networking will always load and run on 68000 and 68020 based Macintosh systems, even if Open Transport is also installed; PCI-bus Power Macintosh systems require Open Transport for full networking support.

- On most 68030, 68040, and NuBus Power Macintosh computers, both classic and Open Transport options are available; customers running classic networking can update to Open Transport by using the Network Software Selector, which is located in the Apple Extras folder. However, the base requirement for Open Transport to be active is an Apple Macintosh or PowerBook with at least 5 MB of total system RAM; or a Power Macintosh computer with at least 8MB of total system RAM. If virtual memory is turned on, the additional amount of RAM made available by the feature will be added to the total system RAM to determine if Open Transport will load. If disk cache or a RAM disk is being used, the additional amount of RAM reserved by these features will be subtracted from the total system RAM to determine if Open Transport will load.

- Open Transport v1.1 (and native ASLM) is not available on the Performa and Power Macintosh 5200, 5300, 6200, and 6300 series of desktop computers. Apple is evaluating the changes necessary to have this technology run on these systems. At this time we have no announcements to make on when this will be available.

7) Can I use the Network Software Selector to switch frequently between classic networking and Open Transport?

Apple does not recommend this. The Network Software Selector was designed to make it easy for you to transition to Open Transport, and is expected to be used infrequently by customers. Understanding the way the Installer and the Network Software Selector works will help you better understand the recommendation made by Apple.

When you initially install the System 7.5 Update 2.0, the install script will check the AppleTalk preferences, as well as the MacTCP preferences if this file is present. A matching Open Transport configuration(s) will then be created. Therefore, when Open Transport is first used, the same configuration settings that were previously in use will apply to Open Transport networking.

At any time after the installation of the update, there will be no interchange of configuration or preferences data between the two networking systems. When

switching from classic networking to Open Transport networking, the preferences for classic networking will be "stored away" and left untouched by any configuration changes made while Open Transport is in operation. If classic networking is used at a later time, the Open Transport configurations would similarly be stored away, and the last-used classic settings would be restored along with classic networking.

8) Does Open Transport require more RAM than classic networking?

The actual memory requirements of Open Transport are dynamic, based on the networking services in use at a given time. This is different from classic networking, which allocates a fixed amount of memory to networking services and keeps this memory allocated even after networking services are no longer in use. Other factors that contribute to differences in memory requirements include the following:

- Open Transport provides native PowerPC code; RISC code is typically larger—but also faster—than CISC code.
- Open Transport is very "VM-friendly," and has a much lower memory requirement on systems with virtual memory enabled; classic networking has about the same footprint regardless of the virtual memory setting.
- Open Transport is based on the cross-platform standard STREAMs environment, which increases the total size of the implementation.
- Open Transport includes the new implementation of networking plus backward compatibility libraries.
- To lay the groundwork for Copland's protected memory model, Open Transport allocates memory for TCP/IP in the system area; MacTCP allocated memory in each application.

Thus the difference will depend on which configurations are measured. Some examples include:

- On a 680x0 system with virtual memory off, classic AppleTalk and MacTCP require about 350-450K total system memory; Open Transport will require about 700-800K; that is, Open Transport is about 350K larger.
- On a PowerPC system with virtual memory off, classic AppleTalk and MacTCP require about 350-450K; Open Transport can require up to 1.2 MB; that is, Open Transport is about 800K larger. With virtual memory on, the amount of memory reserved by the system software will decrease, and part of the RAM reserved will be in virtual memory—not the faster physical RAM.

9) What is the current version of Open Transport, and what are its key features?

Open Transport v1.1.1 is the current release of Open Transport. This release is an update to Open Transport v1.1, to address the most pressing customer

requests, in advance of the next feature release of Open Transport (currently planned as OT 1.5 - see Future Directions). Open Transport v1.1.1 includes the following updates and new features as compared to the earlier Open Transport 1.1 release:

- now also supports the Performa 5200, 5300, 6200, and 6300 systems;
- includes internal changes to minimize memory fragmentation resulting from dynamic loading and unloading of TCP/IP;
- includes changes to the TCP/IP DNR for inter-operability with sites using the load-balancing name daemon;
- includes changes for support of the upcoming Open Transport/PPP release;
- includes all bug fixes available to date.

Open Transport v1.1 is the version which comes with System 7.5.3. This general release is recommended for all supported Mac OS systems, and includes the following updates and new features as compared to the earlier Open Transport 1.0.x releases:

Open Transport v1.1 is the version which comes with System 7.5 Update 2.0. This general release is recommended for all supported Mac OS systems, and includes the following updates and new features as compared to the earlier Open Transport 1.0.x releases:

- Now supports 68030 and 68040 based Macintosh systems
- Now supports Power Macintosh systems with NuBus
- Now supports NuBus, SCSI, and CommSlot network interface adapters
- Offers tuning to optimize performance of high-speed datalinks
- Offers tuning to support multi-client, multithreaded server applications
- Includes support for multi-node and multi-homed operation of AppleTalk protocols
- Adds support for raw packet access and promiscuous mode, to enable the development of Open Transport-ready network analyzers and other network management utilities
- Recognizes a significantly expanded selection of MacTCP dial-up network extensions (mdevs)
- Allows reconnection of a dial-up TCP/IP session without reloading networking and without system restart
- Provides display of the datalink Media Access Control address for Ethernet and Token Ring networks
- Provides notification in the event duplicate AppleTalk or TCP/IP addresses are established
- Automatically converts users' existing AppleTalk and MacTCP setting to Open Transport configuration files during installation
- Includes improved compatibility with Apple Remote Access 2.0.1
- Provides a basis for future support for PPP-based AppleTalk and TCP/IP remote networking
- Provides a basis for future support for modem and ISDN communications devices
- Includes support for System 7.5.3
- Includes support for the creation of a "universal System Folder," by allowing classic AppleTalk to run if an Open Transport System Folder is booted on a 68000 or 68020 based system
- Offers improved Balloon Help text for System 7 users
- Includes all bug fixes available to date

10) Where can I get more information about Open Transport in general, and specifically about version 1.1?

Please follow this AppleLink pathway for more information: AppleLink Services:
Apple Sales & Mktg: Apple Programs:

- Communications (Bulletins, Newsletters, etc.):
- Information Updates: System 7.5 Update 2.0 Info

11) Why don't Open Transport and Native ASLM run on the Performa and Power Macintosh 5200, 5300, 6200, and 6300 series of desktop computers?

The development and testing for these components could not be completed on these systems in time for the release of System 7.5 Update 2.0.

NOTE:

With the release of Open Transport 1.1.1, Performa and Power Macintosh 5200, 5300, 6200, and 6300 series computers are now supported.

System 7.5 Update 2.0: FAQ -Other Software (4 of 6) (8/96)

=====

Article Created: 7 March 1996
Article Reviewed/Updated: 12 August 1996

TOPIC -----

This article provides the answers to commonly asked questions about System 7.5 Update 2.0. Specifically, this article provides information about other system software technologies included with the update.

DISCUSSION -----

Other System Software Technologies
=====

1) What is new with QuickDraw GX 1.1.3 included with System 7.5 Update 2.0?
How is it installed?

QuickDraw GX 1.1.3 contains fixes required for the Color StyleWriter Pro driver (which is included with the update). It also fixes a bug where desktop printers revert to their original position on the desktop after a reboot—even if you've moved them to a different place on the desktop. There are also some performance improvements for color ink-jet printers. QuickDraw GX 1.1.3 can be installed from a separate installer that is available as a floppy fulfillment with System 7.5 Update 2.0, and is on the System 7.5 Update 2.0 CD.

2) What is new with PowerTalk 1.2.3 included with System 7.5 Update 2.0?
How is it installed?

The most visible change delivered with PowerTalk 1.2.3 is the decoupling of DigiSign Digital Signature technology from PowerTalk. This capability is accessible through a Custom Install option in the PowerTalk 1.2.3 Installer. With this release are new Starnine PowerTalk gateways for access to Internet mail, Starnine Mail, and C.E. Software's QuickMail. Additional changes include bug fixes to existing problems, bug fixes to problems uncovered during the 7.5.2 effort, and the synchro-nization of PowerTalk Finder Extensions to the current

version of the Finder. PowerTalk 1.2.3 can be installed from a separate installer that is available as a floppy fulfillment with System 7.5 Update 2.0, and is on the System 7.5 Update 2.0 CD.

3) What is new with PlainTalk 1.4.1 included with System 7.5 Update 2.0?
How is it installed?

The major improvements for PlainTalk 1.4.1 are as follows:

- English Text-to-Speech now runs on all Macintosh computers.
- English Speech Recognition has improved performance when used with the built-in microphone on Apple 14 inch AV monitors.
- "Listening" control panel defaults to the much more robust and accurate "push-to-talk" mode. Users hold down a key (defaults to the Escape key), which toggles the microphone on and off as they speak a command (without having to say "Computer" first).
- Speech control panel is compatible with HyperCard 2.3 pop-up menus on Power Macintosh computers.
- The Text-to-Speech part of PlainTalk 1.4.1 is automatically installed when "Easy Install" is selected when installing System 7.5 Update 2.0. If you are interested in installing Mexican Spanish Text-to-Speech or English Speech Recognition, they are available in the PlainTalk 1.4.1 folder in the Apple Extras folder on the CD version of System 7.5 Update 2.0. In addition, PlainTalk 1.4.1 is available electronically at many of the same locations as System 7.5 Update 2.0. Please see the section, "Availability and Distribution" for more information.

4) What is new with Apple Guide 2.0 included with System 7.5 Update 2.0?
How is it installed?

Apple Guide 2.0 features the following improvements:

- Unlimited mix-ins. The previous limit of seven mix-ins has been removed. The number of mix-ins is limited only by the amount of memory.
- The ability to option-click on a panel to copy a picture of that panel to the clipboard has been added.
- Sounds are now played asynchronously.
- System 7.0 and 7.1 are supported.
- Coach marks are displayed in modal dialogs.
- The problem of entire topic areas being eliminated when trying to add a mix-in has been fixed.

- Fixed the problem that occurred while some applications would build their menus, preventing Apple Guide from displaying that application's guide file item, even if one existed in its folder. Apple Guide 2.0 is automatically installed when "Easy Install" is selected when installing System 7.5 Update 2.0.

5) What is new with QuickTime 2.1 included with the System 7.5 Update 2.0?
How is it installed?

QuickTime 2.1 is automatically installed when a customer chooses the "Easy Install" option when installing System 7.5 Update 2.0. The main features of QuickTime 2.1 are the following:

- Provides developers with a high-performance sprite engine, with all sprite images stored as QuickTime compressed images
- A sprite track has been added, which allows sprite animations to be included as part of a QuickTime movie
- Includes a new Modifier Track feature, which allows for the creation of extremely dynamic movies
- Sound Manager 3.1, included with QuickTime 2.1 for Macintosh, for significantly enhanced recording and playback performance on all Power Macintosh computers
- Allows developers to create video that's larger and looks better on most computers, yet still plays back well on slower ones
- Adds a 256-color format to Cinepak, enabling high-quality video playback without any color remapping
- Adds a settings dialog so users can control the font, font size, style, and color of the text
- Using QuickTime 2.1 for Macintosh, Sound Manager 3.1, and any QuickTime aware application (such as Apple's MoviePlayer or Simple Text), a consumer can now transparently open and play ".WAV" and ".AU" format sound files, which are commonly found on the World Wide Web
- Provides a convenient way for developers to easily change the monitor resolution within their title so the content fills the entire screen
- Supports QuickTime Teleconferencing
- Supports the Apple MPEG Media System, providing expanded MPEG support for multimedia developers
- Includes playback support that allows digital video compression cards to provide QuickTime with memory to store compressed video data as it is read from the disk

6) What is new with Desktop Printing 1.0.3 included with System 7.5 Update 2.0?
How is it installed?

Desktop Printing Software v1.0.3 fixes memory-related problems that occur on Power Macintosh computers with Open Transport installed. If you have a Power Macintosh 7200, 7500, 8500, or 9500, you may have experienced system errors while printing to a desktop printer. This is especially likely if you have turned off virtual memory. Desktop Printing Software v1.0.3 includes support for the Extensions Manager. All three components of the Desktop Printing Software now appear in the Extensions Manager control panel. These components include the Desktop Printer Extension, Desktop PrintMonitor, and Desktop Printer Spooler. If you do not already have Desktop Printing Software in your system, you can install it by choosing the "Custom Install" feature when installing System 7.5 Update 2.0.

7) What is new with QuickDraw 3D 1.0.3 included with System 7.5 Update 2.0?
How is it installed?

QuickDraw 3D 1.0.3 is a minor maintenance release that provides better memory management. It is available as a separate installer that only comes on the CD version of System 7.5 Update 2.0. However, QuickDraw 3D 1.0.3 is also available electronically at many of the same locations as System 7.5 Update 2.0. Please see the section, "Availability and Distribution" for more information.

8) Why isn't OpenDoc included with System 7.5 Update 2.0?

The current OpenDoc release is targeted primarily to developers. When Apple is ready to deliver OpenDoc to customers, it will be included with future system software releases.

System 7.5 Update 2.0: FAQ- System Requirements (5 of 6) (1/97)

Article Created: 7 March 1996
Article Reviewed/Updated: 17 January 1997

TOPIC -----

This article provides the answers to commonly asked questions about System 7.5 Update 2.0. Specifically, this article provides information about the system requirements for and the availability of the update.

DISCUSSION -----

System Requirements
=====

1) What are the system requirements for System 7.5 Update 2.0? Have they changed from the original System 7.5?

Apple is very sensitive to the fact that many of our customers want to continue to evolve with our system software, but do not want to upgrade their systems in order to do so. The hardware requirements to run System 7.5 are not changing with this update. The current system requirements for System 7.5 are an Apple Macintosh or PowerBook with at least 4MB of RAM (8MB required for PowerTalk and QuickDraw GX); or a Power Macintosh computer with at least 8MB of RAM (16MB required for PowerTalk and QuickDraw GX). Open Transport requires an Apple Macintosh or PowerBook with at least 5 MB of RAM; or a Power Macintosh computer with at least 8MB of RAM. In order to install System 7.5 Update 2.0, System 7.5, 7.5.1, or 7.5.2 must already be installed on the system being updated.

2) When I install System 7.5 Update 2.0, will the system software use more RAM than previous versions of System 7.5, as indicated in the "About This Macintosh" box?

Generally speaking, yes. However, the amount of RAM will vary greatly depending on which Macintosh system you are up-dating, and what your system configuration is. The two areas that will affect the additional amount of RAM being reserved by the system software are updated system components and a new system technology

that is included with the installation of System 7.5 Update 2.0.

A number of system software components are being updated with System 7.5 Update 2.0. Many of these new components must reside completely in RAM. This accounts for the increase. The new components include important improvements in stability and/or performance, which should outweigh the RAM impact. Most of the new components being delivered with System 7.5 Update 2.0 that require more RAM affect Power Macintosh systems only, including native versions of QuickDraw, SCSI Manager, Resource Manager, and SerialDMA. Tests indicate that the RAM reserved for system software for some 680x0-based Macintosh systems will increase less than 100K as compared to System 7.5.1, while the RAM reserved for system software for some Power Macintosh systems will increase 300K-850K as compared to 7.5.1. The results you will see may vary.

The other factor that may affect the RAM reserved for system software is Open Transport, one of the new technologies included with the System 7.5 Update 2.0. For information on this, please see the question above, Does Open Transport require more RAM than classic networking? in the section on Open Transport.

Apple recognizes that customers may be concerned that the system software requires more RAM with the latest release. Reducing the RAM footprint for system software is something that Apple will consider for future system software releases.

3) Do I need System 7.5 Update 1.0 in addition to System 7.5 Update 2.0?

No. System 7.5 Update 2.0 includes all of the improvements made in System 7.5 Update 1.0. Therefore if you are plan-ning on installing System 7.5 Update 2.0, you do not need to install System 7.5 Update 1.0. Apple will discontinue the fulfillment program for System 7.5 Update 1.0 when System 7.5 Update 2.0 starts shipping.

Availability and Distribution

=====

1) Where can I get System 7.5 Update 2.0 in the United States? This update can be obtained in many different places, including:

- Apple's File Transfer Protocol (ftp) site on the Internet - Connect to:
<ftp://ftp.info.apple.com>
- Apple's World Wide Web sites on the Internet - Connect to:
<http://www.info.apple.com/swupdates>
- America Online: Use the keyword "applecomputer"
- CompuServe: Use the shortcut "GO APLSUP" to take you to the Apple Support Forum
- Order the update on a CD or a floppy disk set for \$13 from Apple. Call 1-800-293-6617, ext. 984

2) How can I obtain a localized version of System 7.5 Update 2.0 if I live outside the United States?

Many countries will be providing this update via on-line services and the Internet, and most are expected to provide a program where customers can obtain System 7.5 Update 2.0 on a CD-ROM or floppy. Customers will want to contact their local Apple Assistance Center for information on how to get the update. In Europe, most of the localized versions will be posted on the Apple European ftp mirror site ([ftp.info.euro.apple.com](ftp://info.euro.apple.com)).

DISCUSSION -----

For More Information
=====

1) Where can I get more information on the specific changes being made with System 7.5 Update 2.0?

Apple has provided a great deal of information on the changes that are delivered with this update. This information is distributed as part of the update. If you would like this information, please refer to the documents titled Installing This Update, New in This Update - 1, New in This Update - 2, and New in This Update - 3.

2) Where can I get more answers to common questions about System 7.5 Update 2.0?

It is expected that new questions and answers will come up once this document is released. Because of this, this document will be posted on AppleLink where new questions and answers will be added. Please follow this AppleLink pathway:

AppleLink Services: Apple Sales & Mktg: Apple Programs:

- Communications (Bulletins, Newsletters, etc.):
- Information Updates: System 7.5 Update 2.0 Info

Other System Software Projects
=====

1) What is Zhag and Zeus, and what are the differences between them?

Zhag and Zeus are code names for system software projects that are going on in parallel within Apple and are complementing each other. Both projects are delivering System 7.5 version 7.5.3, but the delivery mechanisms and components are different. The chart below provides a comparison.

Zhag	Zeus
=====	=====
Zhag updates a Macintosh to system software version 7.5	Zeus ships on PCI-based Power Macintosh computers as system software version 7.5.3
Has same functionality as a Macintosh system running Zeus	Has same functionality as a comparable Macintosh system running Zhag
Requires installation over an existing System Folder	Will come preinstalled on new PCI-based Power Macintosh computers beginning this spring
Distributed via online services, Internet, and a fulfillment managed by Apple (where the update on CDs or floppies)	Only bundled with certain new the the Macintosh systems. Eventually, program all Macintosh systems will ship you can order with 7.5.3, but they will not necessarily be the same as Zeus, which has specific system components for specific computers
Updates any system running 7.5, 7.5.1, or 7.5.2 because it just has the components needed for those computers	Is only qualified to run on certain new computers
Will be introduced first in the U.S. March, and in most countries over the next few months	Will first appear on new PCI-based in Power Macintosh computers in the spring
Specific details on the differences between Zeus and Zhag, including the additional bug fixes and the different components are included in an article in the Tech Info Library.	

2) What is Unity-1, and how does it differ with Zhag?

Unity-1 is code name for the reference release that Apple is working on that will be used to update the version of System 7.5 that we sell in retail stores. This product is typically purchased by customers who are running pre-System 7.5 versions of our system software, and want to upgrade to System 7.5. Unity-1 will update this retail product so that customers buying this product in the stores will be buying our latest version of System 7.5: 7.5.3. Unity-1 can be installed

on a hard drive with no existing System Folder, and will include bootable disks. OpenDoc is expected to be bundled with this product. As of 2/1/96, release of Unity is expected to be in the early spring. Claris Corporation will distribute Unity-1 as an updated version of Macintosh System 7.5.

3) When will Zhag be available in Japan and the Far East?

Japan and the Far East will not be localizing Zhag, but instead will be delivering these improvements to their customers with a localized version of the Unity-1 system software release. The schedule of this release is being worked out and more details will be available in the coming months.

4) Can I install Zhag over Zeus?

Yes.

System 7.5 Update 2.0: PCI-Based Computers&Netware ReadMe(3/96)

Revised: 3/25/96
Security: Everyone

System 7.5 Update 2.0: PCI-Based Computers&Netware ReadMe(3/96)

=====

Article Created: 7 March 1996
Article Reviewed/Updated: 25 March 1996

TOPIC -----

This article contains one of several Read Me files included with System 7.5 Update 2.0. Specifically, this information is taken from the "Novell Netware Users Read Me" file. This information is applicable only if you have a PCI-based Mac OS computer connected to a Novell Netware network.

DISCUSSION -----

System 7.5 Update 2.0 contains the Ethernet Compatibility extension version 1.0.3, which fixes a problem in the system shutdown code. A side effect of this fix is a two-minute delay in shutting down the computer. It may appear that the machine has hung, however after two minutes, the machine will resume the shut down process. This delay can be avoided by logging out of the Netware tree before shutting down or restarting.

Without the Ethernet Compatibility extension, when a PCI-based machine running System 7.5.3 selects Shut Down or Restart, the machine would crash.

To use the Ethernet Compatibility extension, you must custom install the Ethernet Driver Update. This can be done by opening the System 7.5 Update 2.0 Installer, selecting Custom Install in the upper pop-up menu, and selecting the Ethernet Driver Update. This selection is at the very bottom of the list of custom install options.

Performa: Receiving Faxes with Internal GVC Modem (11/96)

=====

Article Created: 7 March 1996
Article Reviewed/Updated: 18 November 1996

TOPIC -----

I have a Macintosh Performa computer with an internal Global Village modem. I am having difficulty receiving faxes while Megaphone is set to receive messages. What should I do?

DISCUSSION -----

To reliably receive calls, follow these steps:

Step 1

Choose the Global Village Fax Center from the Apple menu.

Step 2

From the Fax menu, choose Setup, then choose Receiving.

Step 3

Click on the Receive Fax check-box to turn it on, and set the number of rings that the fax software should use.

Step 4

Click on the OK button.

Step 5

Open the Telephone Setup control panel.

Note: For optimum performance, Megaphone should be left open if the Telephone

Setup control panel is turned on.

Step 6

Turn off the Call Saver mode.

Step 7

Set the number of rings to answer at one more than the number noted in step 3.

Note: The settings in Telephone Setup and in the GVC Fax Center should theoretically work at the same number of rings, but the setup described here has proven to be successful.

Step 8

Close the Telephone Setup control panel.

Apple TV/Video System: Closed Captioning Not Appearing (3/96)

Revised: 3/7/96
Security: Everyone

Apple TV/Video System: Closed Captioning Not Appearing (3/96)

=====

Article Created: 7 March 1996

TOPIC -----

I have a videotape that includes closed captioning information that I wish to view with Apple Video Player. I've turned on closed captioning using the appropriate Apple Video Player "Controls" window. Also, the video window is not set to the smallest size, which I know keeps the closed captioning text from appearing, but I'm still not seeing the closed captioning.

DISCUSSION -----

In order to decode closed captioning information, the incoming video must be passed through the TV Tuner module. If the video cable is attached to the RCA jack of the Apple Video-In Card, closed captioning information will be ignored. Instead, use a standard F-type coaxial cable to attach the VCR to the TV Tuner module.

Apple Video Player: Always Records an Audio Track (3/96)

Revised: 3/7/96
Security: Everyone

Apple Video Player: Always Records an Audio Track (3/96)

=====

Article Created: 7 March 1996

TOPIC -----

Even though no audio cables are attached to the left or right RCA audio-in jacks of the Apple Video card in my computer, the Apple Video Player application still records an audio track. It is a silent track, but it increases the file size of the recorded video significantly, and can potentially impede video capture rates as well. Is there any way to disable this functionality?

DISCUSSION -----

No, the inability to turn off this feature is a trade-off for the simplicity and ease-of-use that Apple Video Player provides. However, the audio track can be removed with Apple's Movie Player application (which is included with QuickTime 2.1) and with most major video applications, such as Avid VideoShop, QuickFLIX, or Adobe Premiere.

Follow these steps to delete the audio track with Movie Player:

Step 1

Open the movie file and choose Delete Tracks from Movie Player's Edit menu.

Step 2

A window will appear that lists Video Track and Sound Track. Choose Sound Track from the list and click Delete.

The movie can now be saved without the audio portion, reducing the size of the saved file.

To prevent the audio track from being recorded in the first place, use a more full featured video application, like the ones listed above.

Macintosh Computers & System 7.5: Freeze Troubleshooting (7/96)

Revised: 10/10/96
Security: Everyone

Macintosh Computers & System 7.5: Freeze Troubleshooting (7/96)

=====

Article Created: 8 March 1996
Article Reviewed/Updated: 10 October 1996

TOPIC -----

This article provides guidelines to help troubleshoot various system freeze symptoms associate with Macintosh computers.

DISCUSSION -----

The following system freeze symptoms are covered in this article:

My computer freezes:

- At the happy Macintosh during startup
- While loading system extensions during startup
- After startup as the Finder is loading
- While the computer is sitting idle
- When launching, using, or quitting application "X"
- When printing from application "X"

In general, it is a good idea to understand when the freezes began to occur. For instance, if the freezes began occuring after adding memory, after adding a SCSI device, or after adding some new software, this might help identify where to begin troubleshooting the symptoms.

- At the happy Macintosh during startup

=====

Step 1

Turn computer off from the back of the computer.

Step 2

Temporarily disconnect external SCSI and serial devices.

Step 3

Wait 7 - 10 seconds for the drive to spin down.

Step 4

Turn computer back on.

Step 5

If computer continues to freeze at the happy Macintosh, try starting up from the system software CD-ROM disc or a Disk Tools floppy disk. The procedure for starting with the CD-ROM disc is documented in the User's Guide. Once you have started up from the CD-ROM disc or Disk Tools disk, run Disk First Aid to make sure hard disk is OK. You may also test the drive with Apple HD SC Setup or Drive Setup.

Step 6

If computer continues to freeze at the happy Macintosh while starting up from the CD or Disk Tools floppy disk, the computer should be serviced by an Apple-authorized service provider.

- While loading system extensions during startup

=====

Troubleshoot this problem as an extension conflict.

Step 1

Turn computer off from the back of the computer.

Step 2

Temporarily disconnect external SCSI and serial devices

Step 3

Start up the computer and hold down the space bar during startup to open the Extensions Manager control panel.

Select the extension set called "System 7.5.x Only".

Step 4

If the computer still freezes during startup, perform a clean installation (or restore new system software) to alleviate possible corrupted system software.

Step 5

If the computer still freezes during startup after a clean installation of system software, the computer should be serviced by an Apple-authorized service provider.

- After startup as the Finder is loading

=====

Troubleshoot this problem as an extension conflict.

Step 1

Restart from the Special menu or the keyboard by pressing and releasing the Command-Control-Power keys.

Step 2

Start up the computer and hold down the space bar during startup to open the Extensions Manager control panel.

Select the extension set called "System 7.5.x Only".

Step 3

If computer still freezes as the Finder is loading, try starting up by holding down the Option key until the desktop is loaded. This prevents open windows from opening which can sometimes cause freezing or lock-ups when loading the Finder.

Step 4

If computer still freezes, perform a clean installation of the system software or restore new system software to alleviate possible corrupted system software.

- While the computer is sitting idle

=====

Troubleshoot this problem as an extension conflict.

Step 1

Restart from the Special menu or the keyboard by pressing and releasing the Command-Control-Power keys.

Step 2

Start up the computer and hold down the space bar during startup to open the

Extensions Manager control panel.

Select the extension set called "System 7.5.x Only".

Step 3

Check to see if any screen savers have been added to the System Folder.
Temporarily disable or remove any screen savers as they may cause this symptom if they are incompatible.

Step 4

If system still freezes while sitting idle with extensions off, perform a clean installation of the system software or restore new system software to alleviate possible corrupted system software.

- When launching, using, or quitting application"X"

=====

Troubleshoot this problem as a possible low memory situation or as a possible application conflict with the system software and/or an extension conflict.

Step 1

Restart from the Special menu or the keyboard by pressing and releasing the Command-Control-Power keys.

Step 2

Once computer has started back up, choose About This Macintosh from the Apple menu in the Finder.

Check the Largest Unused Block of memory in the About This Macintosh window.

Step 3

Check the Memory Requirements of the application to be sure that there is enough free memory for the application to launch. It's important for the application to have at least the Minimum size of memory available to run. (For more information refer to Macintosh Guide's Application Programs topic, "How do I change the memory a program uses?")

Note: It may be necessary to enable Virtual Memory in the Memory control panel to give the application enough memory to run.

Step 4

If the computer still freezes, restart the computer and hold down the space bar during startup to open the Extensions Manager control panel.

Select the extension set called "System 7.5.x Only".

Step 5

Try to launch application again.

Step 6

If the computer still freezes when launching the application, try starting the application with Modern Memory Manager (for Power Macintosh computers) or 32-bit addressing (for earlier Macintosh computers) turned off. Some older applications may not be compatible with these options. Contact the developer for a more up-to-date version of the application.

Step 5

If the computer still freezes, the application may not be compatible with your computer.

Check the application's documentation or contact the developer of the application to determine if the application is compatible with your computer.

- When printing from application "X"

=====

First, troubleshoot this problem as a possible low memory situation. Second, troubleshoot this problem as a possible print driver and application or system software conflict.

Step 1

Restart from the Special menu or the keyboard by pressing and releasing the Command-Control-Power keys.

Step 2

Once computer has started back up, choose About This Macintosh from the Apple menu in the Finder.

Check the Largest Unused Block of memory in the About This Macintosh window.

Step 3

Check the Memory Requirements of the application to be sure that there is enough free memory for the application to launch. It's important for the application to have at least the Minimum size of memory available to run. (For more information refer to Macintosh Guide's Application Programs topic, "How do I change the memory a program uses?")

Note: It may be necessary to enable Virtual Memory in the Memory control panel to give the application enough memory to run.

Step 4

If the computer still freezes when printing and you are using Background Printing, try increasing the Memory Requirements for the PrintMonitor application if problem only occurs during Background Printing. The PrintMonitor is located in the Extensions folder within the System Folder.

Step 5

If the computer still freezes when printing, try disabling the Background Printing option in the Chooser or turn on Virtual Memory to increase the memory available for Background Printing.

Many print drivers including Apple's LaserWriter and StyleWriter drivers allow the user to enable to Background Printing. If there is not enough free memory for Background Printing to run, the computer may freeze during printing.

Step 6

If the computer still freezes when printing, the print driver may not be compatible with the application or system software. Check the printer's documentation or contact the manufacturer of the printer to determine if the print driver is compatible with your computer.

Open Transport 1.1 Read Me (3/96)

Revised: 3/8/96
Security: Everyone

Open Transport 1.1 Read Me (3/96)

Article Created: 8 March 1996

TOPIC -----

This article is the Open Transport 1.1 ReadMe file.

DISCUSSION -----

Open Transport 1.1 Read Me

Introduction

This Read Me document contains late-breaking information about Open Transport compatibility, add-on software, and solutions to known problems with third-party software. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), use Macintosh Guide, available from the Guide (question mark) menu. For technical information about Open Transport, see "Open Transport Technical Info."

Network Interface Options

Open Transport 1.1 supports PCI bus, NuBus, communications slot, and PC-card network interface cards as well as built-in LocalTalk and Ethernet network adapters. For Macintosh models without expansion options, Open Transport supports SCSI-attached network adapters.

Third party network interface options available for Open Transport include fast Ethernet, ATM, and FDDI.

Compatibility

Open Transport is compatible with:

- existing applications that use AppleTalk as specified by Apple Computer, Inc.
- existing applications that use MacTCP as specified by Apple Computer, Inc.
- existing devices (such as printers) that you select in the Chooser
- existing NuBus network interface cards

Open Transport is compatible with existing AppleTalk, TCP/IP LocalTalk and Ethernet networks. Macintosh computers running Open Transport can be added to an existing network without upgrading other computers on the network.

Dial-up Network Connectivity

For connectivity to AppleTalk networks, Open Transport supports Apple Remote Access version 2.0.1 or later.

For dial-up connectivity to TCP/IP networks, including the Internet, Open Transport supports third party MacTCP software extensions known as Link Access Modules, or "mdevs." Serial Line Interface Protocol (SLIP) and Point to Point Protocol (PPP) connectivity are provided through mdevs.

With the appropriate mdev installed, you use either SLIP (Serial Line Interface Protocol) or PPP (Point to Point Protocol) to connect to Internet Service Providers and other dial-up IP-access points. However, not all versions of all mdevs are supported by Open Transport 1.1. For best results, be sure to use the versions of software recommended below.

Open Transport 1.1 recognizes the following MacTCP mdevs. When installed on your system, they are available in the "Connect Via:" pop-up menu in the TCP/IP control panel:

- FreePPP - version 1.0.4 or later
- MacPPP - version 2.1.4 SD or later (version 2.2.0 is not recommended).
- InterPPP - version 1.2.9 or later
- InterPPP II - version 1.1 or later
- InterSLIP - version 1.0.1 or later
- MacSLIP - version 3.0.2 or later
- VersaTerm SLIP - version 1.1.4 or later
- Sonic PPP - version 1.0.2 or later
- AOL Link - the most current version is recommended

In addition, there are a number of third party PPP mdevs (including Pacer PPP, FCR PPP and Tribe PPP) which have a common technology base and as a result are indistinguishable from one another to Open Transport. When installed, these appear in the "Connect Via:" pop-up menu in the TCP/IP control panel as "TCP/IP PPP."

NFS/Share 1.3.x and 1.4 are not compatible with Open Transport. To use NFS/Share with Open Transport, you must contact Intercon to obtain a version of NFS/Share that is compatible with Open Transport.

For more information on Open Transport compatibility, contact the developer of the software you want to use.

Obtaining Connectivity Software

FreePPP is shareware and can be found on a variety of Internet sites; typically at "info-mac" mirror sites in the comm/tcp/conn directory. A list of info-mac mirror sites can currently be found at:

<http://www.mcp.com/hayden/iskm/info-mac-mirrors.html>

Some sites where FreePPP can be found currently include:

<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/conn/>

<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/conn/>

MacPPP version 2.1.4 is available as a part of the Apple Internet Connection Kit. For fax information in the US, contact Apple Computer Inc., at 800-462-4396. To locate an Apple reseller near you in the US, call 800-538-9696.

InterPPP, InterPPP II, and NFS/Share are commercial software products. For availability and ordering information in the US, contact InterCon Systems at 800-468-7266 or 703-709-5500.

MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information in the US, contact TriSoft at 800-531-5170 or 512-472-0744.

VersaTerm SLIP is commercial software developed by Synergy Software. For availability and ordering information in the US, contact Synergy at 610-779-0522.

SonicPPP is commercial software developed by Sonic Systems, Inc. For availability and ordering information in the US, contact Sonic Systems at 408-736-1900 (voice) 408-736-7228 (fax).

MacPPP and FreePPP

If you experience problems using MacPPP or FreePPP when Virtual Memory is turned on, try turning off Virtual Memory. To find out how to turn off Virtual Memory, see the topic "How do I use hard disk space as memory" in Macintosh Guide, available from the Guide (question mark) menu.

System 7.5.x: Software Components Versions (11/96)

Revised: 11/4/96
Security: Everyone

System 7.5.x: Software Components Versions (11/96)

Article Created: 8 March 1996
Article Reviewed/Updated: 4 November 1996

TOPIC -----

This article lists the version numbers of Apple software components included with System 7.5.1, System 7.5.2, and System 7.5.3. System 7.5.3 is a new version of System 7.5 that comes installed on computers built after March 1996. You can update from System 7.5, System 7.5.1, or System 7.5.2 to System 7.5.3 by installing the System 7.5 Update 2.0 available online.

This list only includes the basic System 7.5.3 components or System 7.5 Update 2.0 components. Additional installations for PlainTalk, PowerTalk or QuickDraw GX may be available on the startup CD.

"n/a" - not applicable

"-" - no version number

Workgroup Server 8550/132: Time to Ready Workaround (3/96)

=====

Article Created: 8 March 1996

TOPIC -----

This article describes an issue where large and fast hard disk drives do not mount on a Workgroup Server 8550/132 after a cold startup.

DISCUSSION -----

On a Workgroup Server 8550/132 when large drives (2 GB and 4 GB), and fast drives (7200 RPM) are used on both the internal and external SCSI channel, as in a dual-drive configuration, all of the drives may not mount on the desktop from a cold startup. This only occurs with large, and fast drives from a cold restart. This is because the time to ready status is initiated from the drive after the system looks for it.

If this symptom occurs in other situations, its root cause is different.

Workaround

First, use the Startup Disk control panel and deselect all volumes. This delays the system enough for a drive to mount.

Second, select the Restart command from the Special menu. Since the drive will already be spinning, it will respond appropriately to the restarting of the server and mount.

Cyberdog Beta 1.0 Bugs List (4/97)

Article Created: 8 March 1996
Article Reviewed/Updated: 9 April 1997

TOPIC -----

This article is the Cyberdog Beta 1.0 Bugs List as of 12 Feb 1996.

DISCUSSION -----

Welcome to the Cyberdog List of Frequent Bugs. This document is the second stop to the Cyberdog Bug Reporting System. Below you will find a listing of the most frequently found bugs from both our testing efforts and general users. Please check over this list before submitting a bug in the event that it has already been found.

Last Updated - 02/12/96

B1 Bugs

- connecting to an FTP server with a username with a period will fail.
- dragging files with names greater than 31 characters out of FTP will give an error. (workaround: use the Get Item from Server menuitem)
- extremely long gopher listings will sometimes hang on systems running 7.5.3
- Account Info in the Trays menu is activated when a message is selected
- email enclosures to some online services (e.g. AOL) are not received correctly.
- can not drag from the background of a mail window
- mail and news handlers dialog does not let you tab between fields

- can not sort by Status in the Out Tray

A3 Bugs

- Still using A3 and having trouble launching Cyberdog? Get a weird "GetURLPlugIns" error? - [Click Here](#) for the solution.
- Closing windows before they finish drawing will crash (seen most often in mail) - Fixed in B1
- Sometimes Cyberdog mail will get into a state where if you try to download or send mail, you will get an error dialog "...an unknown error occurred for an uncertain reason..." If this happens to you, closing all of the Cyberdog windows and starting again should fix it. - Fixed in B1

Article Change History:

09 Apr 1997 - Removed out dated on line references.

Cyberdog Beta1.0: General FAQ (3/97)

Article Created: 8 March 1996
Article Reviewed/Updated: 3 March 1997

TOPIC -----

This article provides frequently asked questions about Cyberdog Beta 1.0 software.

DISCUSSION -----

Question: What is Cyberdog?

Answer: Cyberdog is the code name for a set of OpenDoc components that provides one-click access to Internet services. It provides a consistent interface, and brings Macintosh ease-of-use to the Internet. In Cyberdog, Internet address is an object that can be dropped into mail, your notebook, OpenDoc documents, or into the Finder. If you double-click on an Internet address, it opens the object, whether it's a web page, a picture (Cyberdog will do any necessary translation or decompression), or a file. And Cyberdog provides you with powerful mail that's integrated with the other Internet components.

Question: Will Cyberdog be the product name?

Answer: Cyberdog is the code name for the technology. We'll announce the product name when it is released.

Question: How can I get the most current information about Cyberdog?

Answer: Visit the Cyberdog home page at <http://cyberdog.apple.com>.

Question: Why use OpenDoc?

Answer: Together, Cyberdog and OpenDoc bring component software to the Internet.

Because it is based on OpenDoc, Cyberdog is built of many small components. This makes it easy for the user to replace or update components as new functionality becomes available. You can choose a component from your favorite vendor, or one that provides the functionality you need, and simply drop it into your system folder to install it. This gives users and developers flexibility to keep up with the rapid addition of new services and data types on the Internet.

Cyberdog brings live Internet connections to OpenDoc documents. You can create links to Internet data, and you can actually embed Cyberdog viewers in a document so when you open the document, the viewer and its data are brought live, right into your document. With this capability, you can customize your access to all of the Internet, and bring the Internet live to documents you create.

Question: Why should I use Cyberdog instead of an all-purpose web browser?

Answer: Cyberdog gives you integrated access to all services on the Internet (including FTP, Gopher, Telnet, World Wide Web, Netnews and E-mail) with the ability to display the full richness of each service. If you try use a browser optimized for the world-wide web, you're forcing other services and data types to be displayed in way that's not optimal for them. Cyberdog avoids this compromise. In addition, with customized Internet documents, Cyberdog allows you to fully integrate the Internet more fully into your daily activities and to share your Internet explorations with friends and colleagues.

Question: What about email?

Answer: Cyberdog provides extremely robust and powerful e-mail capabilities. It supports the full MIME 1.0 standard, so you can use styled text, plus you can drop pictures, Internet links (as links, not just as text addresses), and enclosures right into your message. Cyberdog has mail handlers that filter and sort your incoming or outgoing mail messages. You can create multiple mailboxes for storing your received mail, and search stored messages for any word in any field of the message (full text search).

Question: How does message searching work?

Answer: Cyberdog incorporates Apple's new VTWIN technology developed for the next version of the Macintosh OS, code-named Copland. It indexes full text of all messages 'on the fly', and gives extremely fast relevancy-ranked listing of matches. You can literally search over thousands of messages in seconds.

Question: What about newsgroups?

Answer: Cyberdog makes managing newsgroups easy. With the ability to connect to multiple news servers, search, read messages, and save them in Cyberdog's mail system for archiving (manually or using the News handlers), Cyberdog makes it easy to find the information you want. You can read and post full MIME 1.0-encoded documents, with graphics, styled text, and enclosures (including

live links).

Question: What do you mean by live links?

Answer: A live link is any URL (which stands for "uniform resource locator"). It gives an internet address and can point to an ftp or gopher site, a telnet host, World Wide Web page, an e-mail address, a newsgroup or news server, etc. In Cyberdog, every URL is represented as a labeled icon which indicates what kind of site it is pointing to. These icons, much like Aliases on the desktop, can be dragged to the desktop or other Cyberdog or OpenDoc documents. If you double-click the icon, Cyberdog opens that item, whether it is a file, picture, web page, etc. If they're dragged out of OpenDoc (for example, into your Scrapbook), they become the URL text string. Cyberdog provides icons that represent most of the major Internet data types, so you can tell if the object is a picture, text, file, web, gopher, newsgroup, mail message, or ftp site.

Question: How can I keep track of my favorite places?

Answer: Cyberdog provides a Notebook & a Log to keep track of where you've been.

The Notebook is your place to store Internet references. You can drag into it any web "link" from a web page, any item from the log, or any file saved as a URL from the desktop. Even coolerÉyou can drag any text that has the form of a URL (e.g., <http://cyberdog.apple.com>) into the notebook and it will be accepted as a legal internet address and represented with the appropriate icon. You can have multiple notebooks, so you can easily organize a large volume of links and mail addresses for quick access.

The Log can be displayed alphabetically, chronologically, or hierarchically. Objects can be dragged from the Log into the Notebook, mail, or any OpenDoc document, or to the Finder. Log files can be saved, and the log can be erased.

Question: What about consistency?

Answer: Cyberdog provides a standard browser window for different Internet services (FTP, Gopher, and World Wide Web), with forward and back arrows, display of the URL as both an object (an alias and icon) and a text string (the locator URL), a pop-up History, and a stop button. Inside the browsing window, each data type is displayed by a different Cyberdog component that gives the best display of that kind of data, so FTP and Gopher are displayed as hierarchical lists, with triangles you can use to click open a category and view the items inside it. This window has grow, zoom, and close boxes. Pictures are opened in their own separate windows, sized to the picture. Text is opened into a window with slider bars, and grow and zoom boxes. Movies and sounds are opened into the Cyberdog "player" window.

Question: Can I get directly to an Internet site or address?

Answer: Yes! You can use Cyberdog's "Connect To" menu item to directly access any URL, newsgroup, or mail account.

Question: What Internet services/standards does Cyberdog support?

Answer: Cyberdog supports the popular Internet standards: Telnet (vt100), FTP, Gopher, World Wide Web (http protocol and HTML hypertext language), Newsgroups (NNTP), mail (POP/SMTP), and MIME 1.0. Cyberdog provides viewers for text, GIF, JPEG, PICT, QuickTime, .au sound, .WAV sound, and .AIFF sound. We are working with 3rd parties to encourage them to develop OpenDoc components for chat, sound, and video.

Question: What about secure transactions?

Answer: The final release of Cyberdog will include Netscape's SSL protocol encryptions, and a key icon will appear at the top of the Cyberdog browser window whenever a secure connection is made.

Question: What HTML standards does the world-wide web browser support?

Answer: The Cyberdog web browser supports all of HTML 2.0 and includes tables and background pictures from HTML 3.0.

Question: Can Cyberdog use plug-ins and applets?

Answer: Plug-ins and applets are a way of moving toward the benefits of component architecture. Cyberdog is already built on the OpenDoc component architecture, and therefore it's easy for developers to create new components and viewers for new technologies as they become available. The advantage of using Cyberdog is that any component for displaying a data type (Java, QuickTime VR, or web) can be incorporated into it. Extending this to other OpenDoc containers, you could even have Java applets that work in your OpenDoc-based spreadsheet or word processing document. We're working with 3rd parties to develop ways to either use applets and plug-ins with Cyberdog, or to develop the same technology as an OpenDoc component.

Question: How does Java fit with Cyberdog?

Answer: The beauty of Cyberdog is its ability to integrate data from multiple sources (including the Internet) into desktop applications. Although Cyberdog doesn't currently support Java, Apple and 3rd parties are investigating development of Java components that would integrate with Cyberdog and OpenDoc. In addition to Java support in the HTML browser, the Cyberdog/OpenDoc approach means that Java applets can move out of the browser and be integrated into any OpenDoc container.

Question: Can Cyberdog share preferences with my existing Internet

applications?

Answer: Yes. On the Macintosh, Cyberdog uses the de facto standard for storing Internet application preferences, an application called "Internet Config". This allows it to easily co-exist with commonly used Macintosh internet applications, and makes it easy to transition from applications to component software.

Question: How can I connect to the Internet with Cyberdog?

Answer: For network connections, Cyberdog uses standard TCP/IP protocols and so will work on any type of network that supports TCP/IP. This includes Ethernet, LocalTalk, Token-Ring, FDDI, ATM, Frame Relay local and wide area networks, as well as dialup networks based on SLIP, PPP or Apple Remote Access (if an IP Gateway is present). You can use MacPPP or any other Macintosh-based PPP to connect to Internet services through a phone line and modem. (These applications are not supplied with Cyberdog.) If you already have an Internet provider, or an Internet mail account, you can continue to use them with Cyberdog.

Question: Is Cyberdog compatible with my Internet Service Provider?

Answer: As long as access to your Internet provider is offered through standard Internet protocols (SLIP/PPP) Cyberdog will be completely compatible with your provider. Cyberdog will work with any provider that offers servers compatible with today's leading Internet applications like those included in the Apple Internet Connection Kit. Cyberdog will not work to access proprietary protocols, such as those used by the so-called "online" services (like American Online, CompuServe, etc.).

Question: How will Cyberdog be distributed?

Answer: The beta and final versions will be distributed free over the Internet from Apple's web and FTP sites. The final version will be bundled with Apple Macintosh computers and Mac OS releases. There will be a retail version for current Power Macintosh and Mac OS clone owners. We're also investigating 3rd party distribution.

Question: Will Cyberdog replace the Apple Internet Connection Kit?

Answer: Since Cyberdog requires Power Macintosh and OpenDoc, we'll continue to provide the Apple Internet Connection Kit for those Macintosh owners who don't have the required hardware and system configuration.

Question: What's the upgrade path for customers?

Answer: You can download Cyberdog from the Internet, if you have a hardware configuration that supports Cyberdog.

Question: What are Cyberdog's system requirements?

Answer: Cyberdog requires system 7.5.1 or later, OpenDoc 1.0, a Power Macintosh with 8 MB memory with Virtual Memory turned on, or 16 MB of memory with VM off. (This is the requirement for the system, OpenDoc and Cyberdog.)

Question: Will there be a Windows version of Cyberdog?

Answer: Apple's current focus is Cyberdog for Mac OS, since today OpenDoc only runs on the Mac OS. OpenDoc for Windows is expected before the end of 1996. We are in discussion with several vendors who could bring Cyberdog to OpenDoc for Windows.

Question: What does Cyberdog offer developers?

Answer: Cyberdog provides technology that extends OpenDoc that any developer can use to create live links to the Internet in any OpenDoc component. It gives developers a consistent user interface for accessing the Internet, and a public set of APIs to replace, extend, or build new components. Developers can not only create replacement components that provide more functionality than the original Cyberdog components, they can add new services (such as RealAudio), or provide ways to incorporate the Internet into other components such as word processing, charting, or presentations. Visit our Developer Information web page.

Cyberdog Beta 1.0 Release Notes (3/97)

Article Created: 8 March 1996
Article Reviewed/Updated: 3 March 1997

TOPIC -----

This article are the Cyberdog Beta 1 release notes.

DISCUSSION -----

Software License

Please read the software license agreement carefully before installing the software. By installing the software, you are agreeing to be bound by the terms of this license. If you do not agree to the terms of this license, do not install the software.

System Requirements

The beta 1 release of Cyberdog requires a Power Macintosh with at least 12 megabytes of memory, although 16 megabytes is recommended. Both OpenDoc version 1.0 and MacTCP or Open Transport with TCP/IP must be installed for the system to operate. Install OpenDoc before installing Cyberdog.

WARNING: This is beta quality software. It is highly recommended that the software be installed over a clean version of System 7.5.1 or later, preferably on a test or non-production machine. Some instability and crashes may be experienced.

Using the Mail System

To use the Cyberdog mail system you will need an SMTP/POP3 account on a UNIX machine or other system or a Macintosh server running software such as MailShare or the Apple Internet Mail Server. See your system administrator to acquire an account. Once Cyberdog has been installed, to set up a connection to your server select the *Connect ToÉ* item from the Cyberdog menu, then click on the *Mail* icon. Mail and other preferences are stored in the "Internet Preferences" file

in the Preferences folder, created by the Internet Config extension. If you have currently been using Internet Config and have set up another POP3 mail server your Cyberdog mail connection will already be set up.

Known Problems in b1

Cyberdog has not been thoroughly evaluated in combination with many third party system extensions so compatibility with those is not know. Also, because of some memory leaks some long duration Cyberdog sessions may terminate in a crash. You might wish to save the Notebook frequently (using the "Save" command from the Document menu) since you may lose recent additions to the Notebook in the event of a crash. Finally, Cyberdog has not been fully tested for compatibility with all OpenDoc parts.

Upgrading from version a3

If you have been using a3 or another previous version of Cyberdog you will have to throw out and rebuild your current Notebooks. You can drag most and you should also throw out your old Log file in the Cyberdog Preference folder in the Preferences folder in the System Folder. To be safe you may also wish to back up previous mail storage files (which are stored in the "Cybermail" folder in the Preferences folder) before you open mail trays in the new version. To be extremely safe, after you have installed version b1 you may wish to create new mail trays and move mail from the old ones into them.

Reporting Problems

Please use our bug reporting web page to report any bugs or problems you may encounter in using version b1 of Cyberdog.

Cyberdog Technical FAQ (1/97)

Revised: 1/3/97
Security: Everyone

Cyberdog Technical FAQ (1/97)

=====

Article Created: 8 March 1996
Article Reviewed/Updated: 3 January 1997

TOPIC -----

This article is the Cyberdog technical FAQ (Frequently Asked Questions).

DISCUSSION -----

We encourage you to read this FAQ. Often times someone else has already asked your question and if so, this is where the answer will be! You can also access our WEB site at:

<http://cyberdog.apple.com/br/techfaq.html>

General Cyberdog
=====

Question: How can I rename items?

Answer: There is a "Rename <<Item>>" command in the Edit menu. You can now use Command-E as a shortcut for Rename.

Question: What version of Internet Config do I need to run Cyberdog?

Answer: In order to run Cyberdog you need Internet Config extension 1.2 in the Extensions folder. Cyberdog provides an interface to most of the preferences found in Internet Config, but not all of them. If you want to be able to set the few settings we don't yet have an interface for, such as mapping extensions to helper applications, you will need the Internet Config 1.2 application. The latest Internet Config.

Question: Does Cyberdog have support for firewalls and proxies?

Answer: We support SOCKS firewall for all protocols and CERN proxies for gopher, FTP and HTTP. We do not support either of these on a protocol-by-protocol basis.

Question: Does Cyberdog work on a 680x0 Macintosh?

Answer: Yes, Cyberdog works on all Power Macintosh computers as well as 68030, 68040 and 68040LC processor-based Macintosh computers.

Question: In the Cyberdog Preferences, Firewalls Item, under the "Exceptions" button, is there any way to specify a whole group of machines such as all machines ending in ".mitre.org" for example?

Answer: No.

Question: How do I cancel or stop processes in Cyberdog?

Answer: Anywhere you see our running dog icon, click it to cancel or stop the process that is running. Command-. (Command-Period) is a shortcut for Cancel.

Question: How can I embed the various CyberParts into an OpenDoc document?

Answer: You can embed Cyberdog parts into OpenDoc documents several ways:

1) Drag a Cyberdog icon (for example, from the Notebook, Log, or browser window) directly to the OpenDoc document and drop it in.

2) Drag in the stationery of the Cyberdog part you wish to embed in the OpenDoc document and drop it in. You can find various stationery (for example, cyberbutton stationery) in the Tools folder.

3) Drag a Cyberdog part file into the OpenDoc document. (Note: the file needs to be closed; you cannot drag an open part window into a container and drop it.)

Question: Is there a way I can get Cyberdog to display different icons for things based on their extension?

Answer: Yes, Cyberdog supports Internet Config 1.2 or later, which in turn supports extension mapping. Use the Internet Config application and set your preferred mappings there.

Question: Will Java and VRML be supported?

Answer: Initial Java support will be made available with Cyberdog 1.1 and refined with later releases. VRML is not yet supported.

Question: Will there be a Windows version of Cyberdog?

Answer: Currently, Cyberdog runs only on Power Macintosh and Macintosh computers.

Question: Can you specify another post-processor instead of the Stuffit Expander?

Answer: Yes. If you have the Internet Config 1.2 Application, you can change the default settings for post-processing of files.

Question: What does the menu item "Browse In Place" in the Navigator menu mean?

Answer: The "Browse In Place" setting lets you choose between creating a new navigator window when you follow a link or replacing the content in the current navigator. If the "Browse In Place" menu item is checked then when you follow a link, the content in that current window will be replaced by the content you were navigating to. If the "Browse in Place" menu item is NOT checked then when you follow a link, Cyberdog will create a new navigator window and put the new content in there.

Question: Sometimes I just want just one new window. Do I have to use the "Browse In Place" menu item?

Answer: No, all you have to do is hold down the option key and click (or double-click if you are in gopher or ftp). The link and the preference will be reversed just for that link. If "Browse In Place" is NOT checked, then the option key again reverses the preference and you WILL replace the content in that particular window.

Question: Is it "CyberDog" or "Cyberdog"?

Answer: It is "Cyberdog".

Question: How can I open my Netscape Bookmarks file in Cyberdog so I can copy over the links easily?

Answer: Simple, open up the notebook you want them imported to. In the Notebook menu, there is an Import submenu. Use the Import Netscape Bookmarks menu item. This will open a dialog box and allow you to pick the bookmark file you want to import. Select it and hit OK. Cyberdog will import all of the links from the Bookmarks file into the notebook and place them in a category called Bookmarks.

Question: Does Cyberdog 1.1 support QuickDraw GX printing?

Answer: No, Cyberdog 1.1 does not. It is something we hope to support in a

future version.

Question: How do I setup Internet Config to use helper applications such as Real Audio?

Answer: Cyberdog caches the Internet Config file mapping table when it launches, so you need to make any changes to your Internet Preferences before launching Cyberdog, otherwise you will have quit Cyberdog and re-launch it.

Here is a web page that describes how to setup Real Audio as well:

http://www.novagate.com/%7Eacgolf/charles/html32/ra_help.htm

To set up Real Audio, launch Internet Config and click on the File Mappings button. Then click the Add button. Now, setup the Mapping Entry dialog as follows:

```
"Name:" field = Real Audio
"Extensions:" field = .ram
"MIME Type:" field = audio/x-pn-realaudio
Select the Binary Data radio button
"File Type:" field = PNRM
"File Creator:" = PNst
```

Once that is done, click the Add button again, and configure dialog just as you see below.

```
"Name:" field = Real Audio
"Extensions:" field = .ra
"MIME Type:" field = audio/x-pn-realaudio
Select the Binary Data radio button
"File Type:" field = PNRM
"File Creator:" = PNst
```

Question: I have been reading about people making their own "Internet Starting Points", but I can not seem to get it to work. Help!

Answer: OK, here are some quick tips on creating your own "Internet Starting Points":

- Double-click the DocBuilder Stationery inside the Tools folder of the Cyberdog b1 folder. This will create a new DocBuilder document. Give it a name and save it.
- Also in the Tools folder, you will see Cyberbutton Stationery. Take that and drag it into your blank DocBuilder document. After a few seconds, an unwired button will appear on the document. You can move this button around to your desired location.
- Since this is OpenDoc, there are several things you can do with this button and several ways to interact with it. I will not go into all of them here, but if you hold the option key down and click on the button, you will notice it

behaves differently then if you hold the command key down. These two options help you move the button and help you activate the Cyberdog menus so that you can wire this button up to the Internet.

- You can wire this button simply by dragging and dropping a Cyberdog icon atop of the button and letting go. Or, you could use one of the many Cyberbutton menu items to help you.

- You can embed as many Cyberbuttons in your document as you like, as long as you have the memory for it.

- You can also embed other things as well. Like the notebook for example. If you drag and drop the Notebook Stationery, also in the Tools folder, into your DocBuilder document, it will embed a notebook there.

- Make sure you save frequently. This is about all I can go into right now. We will have better documentation as time goes on.

Question: I have saved an icon to a web site in my notebook, but the URL is wrong. How do I edit it?

Answer: There is no clear cut way to "Edit" a URL at present. Follow this workaround:

- Select icon of URL to edit.
- Select Get Info menu item from Edit menu.
- Copy the URL that is displayed in the window and close.
- Click back in the notebook to activate the Notebook menu.
- Use the Add Item to Notebook menu item in the Notebook menu.
- Select the URL panel and paste the URL into the text block.
- Edit the URL as necessary.
- Click OK and then choose a place to save the icon.
- Go to the new item, use the Rename menu item in the Edit menu to give it a new name.
- Delete the old, incorrect item.

Question: I really like the idea of using two notebooks, but I do not seem to have the memory to run two OpenDoc processes at the same time, am I out of luck?

Answer: No, you are not. In Cyberdog 1.1 with OpenDoc 1.1, all Cyberdog documents will be opened in one process, just like there was an application! This means, you can open as many Notebooks as you have memory for and not have to worry about duplicate processes. Also, you can increase Cyberdog's memory by Getting Info on the Cyberdog application and changing the memory in the field given in that window.

Web/HTML/HTTP Related
=====

Question: Does Cyberdog support the Blink tag?

Answer: Yes, Cyberdog displays <BLINK> text in the OUTLINE style.

Question: What level of the HTML standard does the Cyberdog web browser support?
1.0, 2.0, 3.0?

Answer: Cyberdog supports HTML 2.0 plus the following from the HTML 3.0 draft:

- Image width and height
- Backgrounds
- Tables

Question: Does it support any Netscape extensions? Does it support any other HTML extensions such as ones made specifically for it?

Answer: The Cyberdog web browser has no special extensions. We support the following Netscape additions:

- Horizontal Rule size, width, align, and no shade
- List bullet shapes, numbering styles, and start value.
- Font size (base font too)
- Centering
- Background, text, and link colors.
- ®, ©, ™, , <, >

Question: Does the web tool support JPEG images?

Answer: Yes.

Question: Does Cyberdog support the <EMBED> tag?

Answer: Yes, Cyberdog 1.1 supports the <EMBED> tag. With it, Cyberdog can view plug-in, Java and other Cyberdog browsers inside the web viewer.

Question: Can I connect to a secure server when my proxy serve is enabled?

Answer: No, first go to your preference panel and turn off your proxy and then re-connect to the secure server.

Question: I saw in the release notes that you can drag multiple links from web pages into my notebook or the Finder.

Answer: Absolutely! Try this. While in Cyberdog, use the URL connection panel and connect to a website that you know has alot of links on it, Yahoo! for example. Then, simply select ALL of the links you want to move into your Notebook. Then, drag that block of selected text to your Notebook and watch what happens. Voila! If you want all of those items, but just not in you current notebook. Drag that block of text to the Finder. Cyberdog will make a new notebook for you with all of those items in it!

File Transfer/FTP Related
=====

Question: How do I upload something to an FTP Server?

Answer: Simply drag the file into the appropriate folder or window once you have connected to the server, or use the "Put File on Server" menu item.

Question: Can I rename things on an FTP server? How about delete? And can I move things as well?

Answer: You can do all of these things as long as you have the correct permissions on that server. To rename a file simply select the item and use the "Rename" menu item. To delete a file, select the item and use the delete key or the "Delete" menu item. To move a file, drag it to the appropriate place and drop it.

Question: Does Cyberdog support Passive FTP?

Answer: Yes it does. Check in the FTP Preferences Panel.

Question: Every time I try to upload something to an FTP server, it binhexes it even when I don't want it to, say for text files with HTML or pictures?

Answer: Cyberdog binhexes any file that is not "flat", meaning any file that has a resource fork. To work around this, make sure the files you are trying to upload do not contain a resource fork.

A work around I use when uploading pictures that have resource forks is to use the file:/// URL in the Cyberdog Connect-To to open the picture into the Cyberdog picture viewer and then I Save a Copy as Generic File and Cyberdog will save it as the file type indicated in Internet Config for that extension without a resource.

Question: When I FTP why is my password displayed in the URL, and why does FTP show up in the web browser window?

Answer: These are the side effects of using a Cern Proxy server in your firewall preferences. Proxy serves information in HTML format, thus we display it in the web browser. The reason your password is displayed in the URL field is because that's the real URL. We could put up a "fake" URL but we haven't yet decided whether or not that's the right thing to do.

A workaround for Q1 would be to enter the site (and path) and user name in the Connect dialog, but NOT your password. You will be prompted for your password upon connection and it wont be displayed in the URL.

A workaround for Q2 would be to use one of the other firewall options - SOCKS or Passive, if you can. I'd recommend turning on passive support under FTP preferences as it's the fastest and most transparent option.

Mail, News and Message Editor Related
=====

Question: Is there an easy way I can read my messages after I download them without having to close and open them over and over again?

Answer: Yes! Open up the first message, then to page down the message if it is a long one, just hit the space bar. Presto, you are scrolled down one page that you can view. If you are at the end of the message, it will close that one and open the next one! If you are in a real hurry, you can hit the enter key to always go to the next message instead of scrolling down in a long one.

Question: What if I also wanted to DELETE them as well?

Answer: Hold down the Option key when you use either the space bar or enter key to go to the next message. This will delete your current message and open the next one for you.

Question: Is there some visual way to distinguish between an unwanted article and a read article?

Answer: No, not at present. There is a visual way to distinguish between read and unread (the check marks), but unwanted messages simply do not get displayed as default, and you can toggle between that view with the menu item, "Display Unwanted Items".

Question: How many news articles can I download?

Answer: In the Mail & News Setup dialog, the News preference has a field where you can set the limit of the number of articles you want to download.

Question: The Mail and News Handler window confuses me a bit, is there a trick to it?

Answer: Here are a few tips that might help make using Handlers a little easier:

- The three When fields use logical AND when trying to match a condition. That is, a match will be found only when all three conditions are matched.
- The Apply To fields tell Cyberdog what source of messages (mail trays, newsgroups) you want these handlers to work on. For mail, the handlers may apply to all of the Outgoing messages and/or Incoming messages (either All In Trays or to a Single In Tray). For newsgroups, the handlers may apply to a single

..TIL19477-Cyberdog_Technical_FAQ_1-97_(TA35196).pdf

newsgroup or to all the newsgroups. This list is generated from newsgroups saved in your Default Notebook.

- Mail messages can only be handled once per application of the handlers (because once a message is moved to a different tray, it is no longer available for handling). Therefore, order of your handlers is important.
- To change the order of handlers, simply click on a handler name in the list and drag it up or down to the position you want it to have in the list. Handlers are applied according to their order in the list, top handler first.

Question: I am confused about where I set up mail and once I set it up, how do I check it?

Answer: There are a few ways that you can set up mail in Cyberdog:

1) If you have already set up your preferences in Internet Config for your mail, then go right into Cyberdog and select "Show Mail Trays" under the Mail/News menu. Cyberdog will see your settings in Internet Config and set things up for you.

2) You can set things up yourself by using the Mail & News Setup dialog. In the first panel, Mail, put in your default email address. This is the email address that will be your default from. You can also enter an option choice for your SMTP host if it is different from your POP server. Contact your server administrator for more information on you SMTP host. In the Trays panel, click the Add button for the In Trays. Enter your account name, your account name, POP server and your password (if you want it to be saved). Set your other preferences for how often to check your account, whether or not to leave mail on server and then click OK. Your mail tray is now setup. Lastly, in the Messages panel, fill in your name. This is the second half of your default email address. Then, click OK to close the Mail & News Setup dialog. Now, Show Mail Trays from the Mail/News menu and you will see your In Tray has been created for you. If you have more than one mail account you would like to use with Cyberdog, repeat the above steps as often as necessary.

Question: I want to have a separate SMTP mail host from my POP mail host, how do I do this?

Answer: In the Mail & News Setup dialog, in the Mail panel, there is a field for your SMTP host. Put your SMTP host information in that field.

Question: Why is it that when I open a message I can do "next message" with the space bar, but when I open a new message and then try to go back to my first message, I can no longer do "next message" with the space bar?

Answer: This happens because Cyberdog mail has two possible views for each mail tray, and the connection between arrow keys and positions in a list can be lost when switching between different trays and different views.

Question: No matter what I set my e-mail address to in Internet Config, when I open a new message to send something, I see that address for a second and then an older one replaces it. What's up?

Answer: When you created the letterhead that you are now using, you must have added the old address set in your Preferences either due to the Cyberdog preference bug or because it was not set up yet. Cyberdog letterheads save the header information (From, To, Subject, CC, BCC) as well as anything in the body of the message (pictures, text, cyber icons and enclosures). (When making a letterhead, make sure you set the insertion point to where you want it when it opens before you save it!).

The way to fix the problem of incorrect e-mail address appearing in your "From" field is to do the following:

- Open a New Message and choose the letterhead you want to fix.
- Edit the "From" field to have the correct e-mail address.
- Use the Letterhead menu item in the Message menu and add the current document (if you choose the same name, Cyberdog will simply replace the old one with the new one).

Question: Can I paste into the Address Dialog or into the Find dialog?

Answer: Yes, we fixed this bug for 1.1!

Question: I saved some e-mail addresses into my notebook and gave them nicknames. When I went to send a letter, I just typed in the nickname and sent it, but it didn't work. How come?

Answer: Unlike Eudora, the header fields (To, CC and BCC) are not linked to the address book. So, if you save e-mail addresses into the Notebook and then type out those nicknames in the To, CC or BCC fields of a message, Cyberdog will not know who you are trying to send it to! However, you can easily drag those icons of the e-mail address you want to send to into the appropriate address box, or use the Address button to bring up a dialog with all of the e-mail and news addresses that your Default Notebook knows about.

Question: I have noticed that some of the e-mail and news messages I read have dates and times that just don't seem right, they are either way to late, or way to earlier. Do I have something configured incorrectly?

Answer: Since e-mail comes from all over the world, your Macintosh has to know where it (and you!) are in order to give you the accurate date and time of when it was set. You can do this by going to your Date and & Time control panel and setting the time zone/place where you currently are.

Question: I just created a very lengthy e-mail message and clicked the Send Later button. Of course, right after I did that, I realized I spelled my name

wrong. Is there anyway I can go back into that message and edit it so the whole world does not know I don't know my own name?

Answer: Sure can! Messages in the out tray are now editable. You can save messages to the Out Tray without sending them and re-edit them later. You can Queue messages to be sent later and still edit them before you send them. Already sent letters can also be edited and sent again!

Question: Every time I open a letter, I always get this opened envelope crowding my whole screen. Is there a way I can set it up so that when messages are opened, they open with the envelope collapsed?

Answer: There sure is. Just go to the Mail & News Setup in the Mail/News menu. Click on the icon for "Message" and the Message's Preference panel will display. There are several check boxes that allow you to configure how the envelope is set when new and old messages are opened. Choose the ones appropriate to the desired behavior and then click OK.

Question: I read my articles from a newsgroup, but when I return to that newsgroup, the articles I just read are not marked as read! Why?

Answer: This behavior has been changed! Now, in Cyberdog 1.1, we save the article read-state for the groups you read globally. This means, that no matter where you open the newsgroup item from, a web page, your notebook, or even the Finder, the articles that you have previously read will remain read!

Question: I noticed that imported Eudora Out Trays are dated Jan. 1, 1904; are we just stuck with this, or is there a workaround?

Answer: Yes, we are stuck with it for now. Eudora Out Tray's do not have a traditional date setting so we make it up. In a future version we would like to put something more sensible.

Question: When I save a message from a news server to a personal mail tray, I see a "Writing to Out Tray" message appear. What is up with that?

Answer: When moving a news article to a tray you may see a "writing to Out Tray" message even though you didn't select the Out Tray to move to. This message is incorrect and your message will actually be moved to the tray you selected. You may have to double click the tray to see the message since dinking it does not refresh properly.

Question: Is there a way to import Claris EMailer Mailboxes?

Answer: Yes, there is! You will need to use the MailConverter 2.2 utility to convert your EMailer mailboxes into Eudora mailboxes and then Cyberdog 1.1 can import those mailboxes itself.

AppleTalk Browser Related

=====

Question: When you receive an AppleShare volume CyberItem sent by somebody else, the user name field of the login dialog may be locked, preventing you from mounting the volume using a different user name. How do I change it?

Answer: When you receive an AppleShare volume CyberItem sent by somebody else, the user name field of the login dialog may be locked, preventing you from mounting the volume using a different user name.

To use a different user name follow these steps:

- 1) select the CyberItem in Cyberdog,
- 2) Select "Get Info" in the Cyberdog's edit menu (cmd-L)
- 3) select and copy the URL from the Info window
- 4) paste the URL in the Connect To dialog URL panel (cmd-T)
- 5) change the user name
- 6) hit the enter key to resolve the edited URL

To keep the corrected CyberItem, open the log window and copy the CyberItem to your notebook.

Question: What happens when I get a "Server not found alert" messages?

Answer: If you type a URL and a "Server not found" error is reported, check the spelling of the server name and zone name in the current CyberItem or URL. Also make sure that the server name and zone name are separated by a colon (:) and that slashes and colons are used correctly elsewhere in the URL (for example, slashes between zone and volume name; colons between volume and file paths).

Question: What happens when I get a "Volume not found alert" message?

Answer: A common error is to use the slash character (/) to separate the folder names from the volume and file names instead of using the correct character, a colon (:). A slash should only be used to separate the zone and volume names.

Question: What are the differences between connecting to servers as register user named "Guest" as opposed to, guest access?

Answer: Using "guest@>server<" in an AppleShare URL means connect to the server using guest access. If your server has a registered user named "Guest" and you want to login using this register user name do not use the "guest@>server<" syntax: simply use >server< and enter "Guest" in the login dialog user name field, followed by the appropriate password. Currently, registered user accounts named "guest" must have valid passwords to work correctly.

Question: What do I do about identical volume names?

Answer: When using an AFP URL to point to a file on a server volume that has the same name of a volume already on your desktop, the URL resolution may fail because the volume name is ambiguous.

Question: Why do I get an empty zone browser window when I enter a correct URL?

Answer: When a correct syntax zone URL is used, an AppleTalk zone browser window will open. If no servers appear in a zone and no error message occurs, it may be that the zone doesn't contain any server or that the zone name you typed is incorrect. You may want to check for correct spelling of the zone name in the location field. If you notice that it is incorrect, you can edit the name there and then hit the enter key to correct the error.

What To Do When Cyberdog Crashes

=====

Question: If I try to open a Telnet Connection when my network is not connected, I crash!

Answer: Yes, don't open a Telnet item without being connected to the network!

Question: Sometimes I get into this state where I seem to crash whenever I try to visit a web site or any internet site. It usually occurs right away and it seems to be always happening. Anything I can do to help fix this?

Answer: This sounds like a problem of your log file being corrupted. While Cyberdog is not running, go to the Cyberdog Preferences folder inside the Preferences folder in your System Folder. There will be a file called, appropriately enough, "Log". Throw this file away and restart Cyberdog and things should be better. Note: This file is where your Log Information is stored and removing it will reset your Log in Cyberdog to contain nothing. If this file is important to you, please back it up often. In Cyberdog 1.1, we have made this much more stable. Now, if Cyberdog detects what could be a bad log, it deletes this file and warns the user that it has reset the log to being empty.

Question: After a bad crash, I've noticed that my settings in the Internet Config preferences file are no longer being used. When I go to reset them in Cyberdog and save them, they are ignored! What's happened?

Answer: Sometimes, Cyberdog will corrupt the Internet Preferences file in the Preferences Folder inside the System Folder. To alleviate this problem, remove the Internet Preferences file and restart Cyberdog. New preferences will be created, or you could launch Internet Config 1.3 and it will recreate the preferences as well. Please keep a backup of your Internet Preference file if this happens to you so that you do not lose your preference information.

+-----+	
Non-Apple, networkable laser printers 	May work with the Apple MessagePad, however these have not been tested by Apple Computer.
+-----+	

End_Table

Additional Notes

=====

Macintosh-compatible non-Apple printers that require a serial connection, or are not laser printers (such as the Hewlett-Packard DeskWriter) are not supported.

With the purchase of the Newton Print Pack, hundreds of other printers are available. A list of printers that the Newton Print Pack supports is available in the article "Newton Print Pack: Compatible Printers".

Article Change History:

05 May 1997 - Added eMate, Newton OS 2.x; minor edit.
22 Mar 1996 - Added additional notes and printers.
14 Mar 1996 - Added StyleWriter 2200 to list.

Open Transport 1.1: Memory Fragmentation (8/96)

Revised: 8/29/96
Security: Everyone

Open Transport 1.1: Memory Fragmentation (8/96)

Article Created: 13 March 1996
Article Reviewed/Updated: 29 August 1996

TOPIC -----

It appears that memory does not get released properly after using some TCP/IP applications with Open Transport 1.1. Sometimes the Largest Unused Block in About This Macintosh decreases after quitting TCP/IP applications, but other times it does not appear to decrease.

I have selected 'Load only when needed' in the TCP/IP control panel.

What could be causing this behavior?

DISCUSSION -----

There have been some reports of memory not being released when using TCP/IP applications with Open Transport. Although the issue is under investigation by Apple Engineering, it appears this could be a normal condition for the Mac OS based on the design of the 'Load only when needed' option, especially if non-TCP applications are launched after a TCP/IP application.

When launching TCP/IP applications, if TCP is not loaded, Open Transport loads the TCP/IP stack into the application heap (memory reserved for applications under the Mac OS) after the TCP/IP application. After the last TCP/IP application is quit, the TCP/IP stack unloads from memory. However, if other non-TCP/IP applications have been loaded before quitting the TCP/IP application, memory can be fragmented.

For instance, if you load TCP/IP application A and another non-TCP/IP application B, memory will be arranged as follows (from top of memory to bottom):

Free Memory
APP B
TCP/IP STACK

APP A

Then, later you quit Application A, memory will look like:

Free Memory Block 2

APP B

Free Memory Block 1

At this point, the memory is fragmented because the free memory block is split into two parts by application B. If you looked at About this Macintosh, the Largest Unused Block would be smaller than it was before launching applications A and B. The Largest Unused Block is the largest block of contiguous memory, and with application A in the middle of two free memory blocks, blocks 1 and 2 cannot be joined together to form a larger contiguous block.

The workaround is to deselect the 'Load Only As Needed' option in the TCP/IP control panel (but leave TCP/IP active). This will force the Mac OS to load TCP/IP into memory before applications use any of the application heap and prevent memory fragmentation. The drawback is that memory will always be allocated to the TCP/IP stack defeating the benefits of the 'Load only as needed' option.

The TCP/IP stack will unload from memory about 2 minutes after there is NO TCP/IP activity. With some PPP connections, the stack will not unload. For PPP users, it is recommended they use the 'load always' option.

Article Change History:

Open Transport 1.1: Custom Remove Disables Apple Telecom (3/96)

Revised: 3/13/96
Security: Everyone

Open Transport 1.1: Custom Remove Disables Apple Telecom (3/96)

=====

Article Created: 13 March 1996

TOPIC -----

I used the Custom Remove option in the System 7.5 Update 2.0 installer to remove Open Transport. However, now my Apple Telecom software is no longer active. The Express Modem control panel will not open, and there is an X through the extension icon when starting up the computer. What should I do?

DISCUSSION -----

It appears that the Custom Remove option for Open Transport removes the Apple Shared Library Manager, which is needed by the Apple Telecom Software.

To resolve this, reinstall the Apple Telecom Software to restore the Apple Shared Library Manager. Then, you will be able to use the Express Modem and other telecommunication components again.

Network Software Selector: Disabled Control Panels (4/96)

Revised: 4/12/96
Security: Everyone

Network Software Selector: Disabled Control Panels (4/96)

=====

Article Created: 13 March 1996
Article Reviewed/Updated: 12 April 1996

TOPIC -----

This article contains questions about the Network Software Selector application included with System 7.5 Update 2.0.

Questions Answered in this Article:
=====

- 1) When I use the Network Software Selector application to switch between classic networking and Open Transport networking, what happens to the control panels associated with the disabled networking software?
- 2) I have selected Open Transport in the Network Software Selector application. However, the MacTCP control panel is still in the Control Panels folder. I thought it would be automatically removed. What happened?
- 3) I noticed that when I switch to Open Transport using the Network Software Selector the related MacTCP control panels are made invisible. However, the MacTCP Token Ring Extension remains visible. Will this cause any issues with using Open Transport?

DISCUSSION -----

1) Question: When I use the Network Software Selector application to switch between classic networking and Open Transport networking, what happens to the control panels associated with the disabled networking software?

Answer: The control panels are left in the Control Panels folder but are made invisible. If you wish to verify that they are still there, follow these steps

Step 1

Select Find File from the Apple menu

Step 2

Type the name of the control panel in question

Step 3

Click on the More Choices button.

Step 4

Press and hold the Option key on the keyboard and select the Size pop-up menu.

Step 4

Select Visibility from the options that appear under the Name pop-up menu.

Step 5

Click the Find button.

2) Question: I have selected Classic AppleTalk in the Network Software Selector application. However, I noticed that the MacTCP control panel appears to be invisible. What happened?

Answer: The Network Software Selector checks for specific names of control panels when switching between Open Transport and Classic AppleTalk networking. If you have renamed any of these related control panels, then they will remain active in your System Folder even when you switch to the other network. The solution is to make sure that the MacTCP control panel is named "MacTCP" and the Network control panel is named "Network".

3) Question I noticed that when I switch to Open Transport using the Network Software Selector the related MacTCP control panels are made invisible. However, the MacTCP Token Ring Extension remains visible. Will this cause any issues with using Open Transport?

Answer: Although the MacTCP Token Ring extension is not made invisible when switching to Open Transport, it is not needed or used when using Open Transport.

AShare Client/Win: Port Address Not Shown In Installer (3/96)

Revised: 3/27/96
Security: Everyone

AShare Client/Win: Port Address Not Shown In Installer (3/96)

Article Created: 13 March 1996
Article Reviewed/Updated: 27 March 1996

TOPIC -----

During the installation for the AppleShare Client for Windows (ASCW), the installer asks me for the port address and interrupt request (IRQ) for my network interface card (NIC). None of the settings in the list match the port address for my NIC. How do I tell the ASCW the proper port address?

DISCUSSION -----

The installer does not provide every possible port address setting for every network interface card. If your port address does not appear in the list, you will have to manually change this setting after installation is complete. This setting is stored in NET.CFG, a text file located in the directory in which you installed the ASCW.

Step 1

Proceed with the installation for the ASCW and select any port address from the list when asked to choose one.

Step 2

After installation is complete, go to your ASCW directory (the default directory is C:\apple\a_share).

Step 3

Use a text editor to open NET.CFG.

Step 4

Find the line labelled PORT #1.

Step 5

Replace the value you selected during installation with the proper port address for your NIC.

Step 6

Save the change you made.

Step 7

Restart your computer.

Apple Network Servers: How to Get Replacement Keys (9/96)

Revised: 9/17/96
Security: Everyone

Apple Network Servers: How to Get Replacement Keys (9/96)

=====

Article Created: 13 March 1996
Article Reviewed/Updated: 17 September 1996

TOPIC -----

How can I get additional or replacement keys for our Apple Network Servers? I lost mine. Also, can I obtain a single master key for all my servers since I have more than one?

DISCUSSION -----

If you lose your keys, an Authorized Apple service provider can order a set of new keys with new locks, but you cannot get additional or replacement keys without new locks. However, it is your option to have a locksmith make additional or replacement keys for you as long as the Apple hardware is not damaged in the process which would void your warranty.

An authorized Apple service provider can order the following replacement service part for you:

0922-2084 Lock, Front & Rear with Keys*

At the present time there is no plan to offer a master key. However, depending on demand from customers, this may be implemented in the future.

* Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

This article was published in the Information Alley on 28 March 1996.

Article Change History:

PowerBook: Error Waking From Sleep w/ System 7.5 Updt 2.0 (1/97)

Revised: 1/20/97
Security: Everyone

PowerBook: Error Waking From Sleep w/ System 7.5 Updt 2.0 (1/97)

Article Created: 19 March 1996
Article Reviewed/Updated: 20 January 1997

TOPIC -----

I just installed System 7.5 Update 2.0, and now every time my PowerBook comes out of sleep I get a Type 8 error. What's going on?

DISCUSSION -----

Symptom

A Type 8 error dialog is displayed immediately after waking from sleep on certain models of PowerBook computers.

Issue

Connectix RAM Doubler version 1.6.1 or earlier is incompatible with System 7.5.3 (System 7.5 plus the System 7.5 Update 2.0) on 680x0-based PowerBook computers. This does not include the PowerPC-based PowerBook computers.*

Workarounds

- 1) Remove RAM Doubler. You can use Apple's Virtual Memory if necessary.
- 2) Remove the System 7.5 Update file. This is not recommended because this will eradicate some features that the update provides
- 3) Reinstall the previous version of the system software.

Resolution

This issue has been fix with System 7.5.3 Revision 2. You can find this software on Apple Computer's online software update sites.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

* The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, and 1400cs. Additionally PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

This article was published in the Information Alley on 25 March 1996.

Article Change History:

20 Jan 1997 - Added info about PPC PowerBook computers.
15 Jun 1996 - Added System 7.5.3 Revision 2 information.

PowerBook: Duo Dock Top Cover Upgrade No Longer Available (3/96)

Revised: 3/19/96
Security: Everyone

PowerBook: Duo Dock Top Cover Upgrade No Longer Available (3/96)

=====

Article Created: 19 March 1996

TOPIC -----

I just called my authorized Apple service provider. They told me I can no longer order the Duo Dock Top Cover Upgrade. How am I going to be able to fit my new color PowerBook Duo computer into an original Duo Dock without this top cover? Is there a different my Apple service provider could order?

DISCUSSION -----

The Duo Dock Top Cover Upgrade (M1814Z/A) which is necessary to put a color duo into an original Duo Dock is no longer available.

However, the service part (922-0519, Top Cover, Duo Dock II w/door) is still available. So, if you need the taller top for your original Duo Dock, you will need to ask your authorized Apple Service provider to order this service part instead of the finished goods part.

System 7.5.3: Apple Telecom & No Sound on Pwr Mac 9500 (3/96)

Revised: 3/20/96
Security: Everyone

System 7.5.3: Apple Telecom & No Sound on Pwr Mac 9500 (3/96)

=====

Article Created: 20 March 1996

TOPIC -----

After installing Apple Telecom 2.x on my Power Macintosh 9500, which I recently upgraded to System 7.5.3 (using System Update 2.0), I can no longer hear any sound. Is there a compatibility problem between Apple Telecom and System 7.5.3?

DISCUSSION -----

On Power Macintosh 9500 computers, the Apple Telecom installer places the Audio Tune-up extension in the Extensions folder. This extension fixes a sound problem under System 7.5.2 when using the Geoport Telecom Adapter.

The Audio Tune-up extension is built into System 7.5.3. However, if you still have it installed under 7.5.3, you will experience a problem with sounds. To resolve these problems, simply remove the Audio Tune-up extension.

Network Server LCD Values: Manual Correction (6/96)

Article Created: 20 March 1996
Article Reviewed/Updated: 6 June 1996

TOPIC -----

This article describes a "Using AIX, AppleTalk Services, and Mac OS Utilities on the Apple Network Server" manual correction.

DISCUSSION -----

Below is a corrected version of the table on page 161, Chapter 10 Troubleshooting, of the "Using AIX, AppleTalk Services, and Mac OS Utilities on the Apple Network Server" manual. These are the values displayed during a normal system startup.

Begin_Table

LCD	System Action
510	The system has started the configuration manager.
511	The configuration manager has completed.
517	The system is attempting to mount the / (root) and /usr file systems.
538	The configuration manager is passing control to a configuration method.
539	The configuration method has completed.
551	The system is attempting to vary on the root volume group.
553	The system has completed phase one of the boot process.
591	The system is configuring the Logical Volume Manager (LVM).
593	The system is configuring the low-function graphics terminal.
594	The system is configuring the rendering context manager.
704	The system is configuring a SCSI disk drive.
723	The system is configuring a CD-ROM or other SCSI device.
727	The system is configuring an asynchronous device.
731	The system is configuring a pseudo TTY.
811	The system is configuring the system planar (mainboard).

812 The system is configuring the standard I/O adapter.
814 The system is configuring the NVRAM.
821 The system is configuring the standard keyboard adapter.
823 The system is configuring the standard mouse adapter.
826 The system is configuring on-serial port 1.
828 The system is configuring the standard floppy disk adapter.
831 The system is configuring serial port 2.
868 The system is configuring the integrated SCSI adapter.
874 The system is configuring the graphics subsystem adapter.
921 The system is configuring a keyboard.
925 The system is configuring a mouse.
935 The system is configuring a 3.5-inch diskette drive.
9002 The system is configuring a SCSI-2 adapter.
c301 Apple Desktop Bus (ADB) time out.

Power Macintosh: Write Cache Hard Drive Corruption Issue (5/96)

=====

Article Created: 20 March 1996
Article Reviewed/Updated: 16 May 1996

TOPIC -----

Customers who have installed some third-party hard disk driver software on Power Macintosh computers have experienced some loss of data and corruption.

DISCUSSION -----

The third-party software may improperly handle write-caching which runs the risk of data loss or even corruption of the disks' file structure on shutdown. Apple software properly supports write caching (and always has) on any hard disk shipped.

Many high performance disk drives available for Macintosh computers utilize on-board hardware write-cache mechanisms. Although these devices can enhance disk performance, they also require special software consideration to avoid the loss of data on shutdown.

Write cache functions are part of the ANSI SCSI-2 Specification. These cache functions have been there for a while. A Technote was written by Apple which was directed primarily to IDE and SCSI disk interface module software developers. This tech note addresses ways to flush the disk's write cache during the shutdown process.

Recent postings on the Internet by some third-party hard disk driver software vendors may lead customers to believe this problem is caused by Apple hardware or software. This issue is not an Apple hardware or software issue, it is a third-party issue. Apple has no direct control over what third-party software vendors do with their software. If customers replace the Apple hard disk driver by formatting with a third-party disk driver, or if they purchase a drive from another vendor, Apple has no direct connection with either the third-party software or hardware.

Suggestions

1. Make that you have the latest driver from the vendor from whom you purchased the hard drive.

- Apple Developers have been made aware of the driver requirements and should be updating their drivers if they encounter problems.

- You should update both third-party and Apple drivers to the latest versions for all the drives on your Macintosh computer.

2. After updating the driver, run Apple's Disk First Aid application or run a drive utility program (such as Norton Utilities) to repair any corruption or directory damage that may have occurred previously.

AWS 95 or A/UX 3.x: Manually Executing fsck (3/96)

Revised: 3/21/96
Security: Everyone

AWS 95 or A/UX 3.x: Manually Executing fsck (3/96)

=====

Article Created: 21 March 1996

TOPIC -----

This article describes Manually Executing the fsck command on an Apple Workgroup Server (AWS) 95 or A/UX 3.x after a system crash.

DISCUSSION -----

Running fsck From the A/UX Startup Shell

When restarting an AWS 95 or A/UX 3.x after a system crash, you should perform a manual file system check (fsck) from the A/UX Startup shell. Any file system inconsistency is made worse if you continue to use that file system (consequently modifying it further) without running fsck.

You enter the A/UX Startup shell by turning on your server and clicking the Cancel button or pressing Command-. (Command and period keys) in the dialog box containing "Welcome to the Apple Workgroup Server 95". This cancels the A/UX startup process and presents the A/UX Startup shell. After the A/UX Startup shell displays, the following command-line prompt appears:

```
startup#
```

At the prompt, enter this UNIX command (use lower case):

```
fsck -y /dev/default
```

Press Return to execute this fsck command. The fsck program lets you know which phase and what file system it is checking at any given time. It may take several minutes to complete the check. For a complete description of all the phases of fsck, refer to the "Server Administration with A/UX" manual which came with your Workgroup Server 95.

When fsck completes running, if you see this message, "FILE SYSTEM WAS MODIFIED", it is recommended you execute the above fsck command again. You want

fsck to make a complete check without any modifications or changes.

NOTE: This sequence performs a filesystem check of the root partition. To check other partitions you can modify the fsck command as follows:

```
fsck /dev/dsk/cx0Yd0sZ
```

Where X = SCSI BUS (1, 2, 3 or 4)

Y = SCSI ID of the drive (0, 1, 2, 3, 4, 5 or 6)

Z = Slice where the file system will be created (0 for root volume)

A listing of partitions on the system and their associated mount points can be located in the filesystem table (fstab). This file can be read by entering the following command:

```
cat /etc/fstab
```

Running fsck From the Command Shell

Before running the fsck command, be certain there are no applications running which use mounted filesystems, like AppleShare, and then unmount the filesystems using the following command:

```
umount -a
```

This unmounts all partitions listed in the file /etc/fstab except "/". To run fsck on these partitions all at once, enter:

```
fsck
```

Once the file system check is complete, the partitions can be remounted by entering:

```
mount -a
```

The system is now ready to resume normal activity.

AppleShare Workstation 3.6.1RevB & 3.6.1: Differences (3/96)

=====

Article Created: 21 March 1996

TOPIC -----

I have installed AppleShare Workstation 3.6.1, now after installing System 7.5 Update 2.0 the AppleShare Workstation version is now 3.6.1RevB. What is the difference between 3.6.1 and 3.6.1RevB and which one should I use.

DISCUSSION -----

The only difference between AppleShare Workstation 3.6.1 and 3.6.1RevB is the bundle bit is set on the 3.6.1RevB and is not set on the 3.6.1.

You should use AppleShare Workstation 3.6.1RevB.

Power Macintosh: Audio CDs & 7.5.3 on PCI-based Systems (3/96)

Revised: 3/26/96
Security: Everyone

Power Macintosh: Audio CDs & 7.5.3 on PCI-based Systems (3/96)

=====

Article Created: 21 March 1996
Article Reviewed/Updated: 26 March 1996

TOPIC -----

What changes were made in System 7.5.3 in the way Audio CD ROM discs are used on PCI-based Power Macintosh computers?

DISCUSSION -----

With the advent of System 7.5 Update 2.0 and System 7.5.3, the "Internal CD" and "Playthrough" options no longer need to be selected in the Sound or Monitors & Sound control panel in order to playthrough an Audio CD to internal or external speakers.

An Audio CD will playthrough no matter which selections are made in the control panels, except for mute and volume changes. The change was made for PCI-based Power Macintosh computers only. However, future versions of the Mac OS may implement the change for other Macintosh computers as well.

System 7.5 Update 2.0: Changes to Find File (5/96)

Revised: 5/6/96
Security: Everyone

System 7.5 Update 2.0: Changes to Find File (5/96)

=====

Article Created: 22 March 1996
Article Reviewed/Updated: 6 May 1996

TOPIC -----

Since I installed the System 7.5 Update 2.0, Find File seems to work differently. What changed?

DISCUSSION -----

If you install the System 7.5 Update 2.0 to update your system software to version 7.5.3, the Find File does not work as before. Previously, the file, folder, or application being sought would appear in both the upper and lower window.

Prior to System 7.5 Update 2.0

- If you double-clicked on the item within the upper window, the file or application would launch.
- If you double-clicked on the item within the lower window, the application, file, or folders would be opened and the application, file, or folder would be highlighted within its respective folder window.

After Installing System 7.5 Update 2.0

- Double-clicking the application or file in either the upper or lower window will launch it.

NOTE: This applies to Macintosh computers using the System 7.5 Update 2.0.

AppleScript: Cannot Create New Folder In Finder (3/96)

Revised: 3/22/96
Security: Everyone

AppleScript: Cannot Create New Folder In Finder (3/96)

=====

Article Created: 22 March 1996

TOPIC -----

Using the Script Editor, I recorded a script that creates a new folder within another folder:

```
tell application "Finder"
    activate
    make new folder at folder "my folder" of startup disk
end tell
```

This script records fine, but when I try to run or change it, it fails.

Why?

DISCUSSION -----

This problem occurs If you installed the PhotoFlash Scripting Additions that came with QuickTake camera. The "Photoflash Utilities" addition defines it's own version of "Make Folder" which is different from the one the Scriptable Finder defines. This extension was defined and written before the Scriptable Finder was widely available.

In order to properly create a folder, remove the "Photoflash Utilities" from the Scripting Additions folder located in the Extensions folder.

Color StyleWriter 2400: Communication Rate (3/96)

Revised: 3/22/96
Security: Everyone

Color StyleWriter 2400: Communication Rate (3/96)

=====

Article Created: 22 March 1996

TOPIC -----

What baud rate (data rate) does the Color StyleWriter 2400 communicate at? Does the speed vary depending on which Macintosh computer is printing to the printer?

DISCUSSION -----

The Color StyleWriter 2400 communicates almost constantly at 884.7 kbaud with any Macintosh computer using System 7.x. When the printer is first powered ON, the serial port is set for 57.6 kbaud. The Color StyleWriter 2400 printer driver then queries the printer at 57.6 to determine the type of printer. Once the driver determines it is a Color StyleWriter 2400, as opposed to another printer such as the StyleWriter II, the driver knows the printer supports an external clock so it then sets the printer's serial port speed to 884.7 kbaud. The driver continues using this baud rate until the connection is closed. Once the connection is closed, the port is set to 57.6 kbaud.

The printer supports a 230.4 kbaud rate, but that rate is not used.

Multiple Scan 1705 Display: Viewable Image Size Changes (3/96)

Revised: 3/22/96
Security: Everyone

Multiple Scan 1705 Display: Viewable Image Size Changes (3/96)

=====

Article Created: 22 March 1996

TOPIC -----

I have a Multiple Scan 1705 Display. When I open or close a window that contains a mostly white background, such as a SimpleText document, the viewable image grows. For example, when I open a new document in SimpleText, the size of the image grows by a few millimeters. When the document window is closed, the image shrinks.

DISCUSSION -----

There is nothing wrong with your display. What you describe is normal for the Multiple Scan 1705 Display and typical of all entry level 17-in. displays.

When you display more white areas on your monitor, this draws more current causes the screen raster to move slightly. The same size display at a higher price point contains higher cost circuitry that compensates for the raster movement.

When using MacTest Pro test patterns (all white screen), the various Apple Displays all have different levels of raster movement, or high voltage regulation. This is normal on all displays, regardless of manufacturer.

PCI-Based Power Macintosh: Identifying Processor Cards (4/96)

Revised: 4/9/96
Security: Everyone

PCI-Based Power Macintosh: Identifying Processor Cards (4/96)

=====

Article Created: 25 March 1996
Article Reviewed/Updated: 9 April 1996

TOPIC -----

Is there a way to identify the type and speed of the PowerPC microprocessor being used on the processor cards for the Power Macintosh 7500, 8500, and 9500 series computers?

The processor card is not currently installed in a Power Macintosh so I can't run a benchmark program to check the information.

DISCUSSION -----

On the processor card, there is an FCC ID label, which contains information about the processor type and speed. The FCC ID label is located on the back side of the processor card (the side without the heat sink). The number on the FCC ID label contains 9 alpha-numeric characters, and the last 6 numerals identify the processor and the speed.

FCC ID: xxx601100 = 601 Processor @ 100MHz
FCC ID: xxx604120 = 604 Processor @ 120MHz
FCC ID: xxx604132 = 604 Processor @ 132MHz

Drive Setup: Initialization Fails on 800 MB IDE Drives (4/96)

Article Created: 25 March 1996
Article Reviewed/Updated: 9 April 1996

TOPIC -----

I have a Macintosh computer with an 800 MB IDE hard drive. I am attempting to use Drive Setup 1.0.4 to format the hard drive using the "Low Level Format" option. It appears to start working, but then an error message appears stating, "Initialization Failed." What is going on?

DISCUSSION -----

The symptoms you are experiencing can occur when using version 1.0.4 or earlier of Drive Setup on Quantum 800 MB IDE hard drives. To resolve this issue, you should select the "Zero All Data" option to reformat your hard drive. Note that there is no negative impact to the drive or system.

A newer version of the Drive Setup utility will be released to address this incompatibility.

System 7.5 Update 2.0: Disk Tools Disk Not Supported (4/96)

Revised: 11/12/96
Security: Everyone

System 7.5 Update 2.0: Disk Tools Disk Not Supported (4/96)

Article Created: 25 March 1996
Article Reviewed/Updated: 9 April 1996

TOPIC -----

I recently installed System 7.5 Update 2.0, and I noticed that there are newer versions of Disk First Aid, Drive Setup, and Apple HD SC Setup in the Apple Extras folder. Do I need to update my old Disk Tools disk with the newer versions of these utilities? If so, do I need both Drive Setup and Apple HD SC Setup?

DISCUSSION -----

Apple does not officially support updating a Disk Tools disk with the utilities installed with System 7.5 Update 2.0. There are a couple of reasons for this:

- On some older Disk Tools disks (any that shipped before the release of Drive Setup, such as the original System 7.5 Disk Tools disk), there is not enough room for the System Folder, Drive Setup 1.0.4, and Disk First Aid 7.2.2.
- The System Folders included with Disk Tools disks are significantly modified to fit on a 1.4 MB floppy disk. Because every existing modified System Folder isn't tested with every existing CPU and the newer versions of the utilities, you shouldn't assume that the newer utilities will run reliably from an existing Disk Tools disk.

Macintosh computers that ship with System 7.5.3 installed from the factory will include a Disk Tools disk or CD-ROM disc containing the latest versions of the utilities.

If you need to repair a volume with Disk First Aid or format or initialize a volume with Drive Setup or Apple HD SC Setup, you should start up from another volume (such as a second hard drive, CD, or removeable cartridge drive) running System 7.5.x (not necessarily System 7.5.3) and then run the desired utility. The utility does not have to be on the startup volume, but it cannot be on the volume that needs to be repaired, formatted, or initialized.

If you have a Power Macintosh system (including the PowerBook 500 with PPC upgrade, but excluding the Power Macintosh processor card) or any Macintosh that originally shipped with an IDE hard drive (such as the Macintosh Performa and LC 630CD and 580 series, the PowerBook 150, and the PowerBook 190), you should use Drive Setup. Otherwise, use Apple HD SC Setup.

Note: The following computers are in the Macintosh 630CD family: LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640.

Open Transport 1.1 and Fragmenting TCP/IP Packets (3/96)

Article Created: 25 March 1996
Article Reviewed/Updated: 28 March 1996

TOPIC -----

I have a network administrator commenting that Open Transport 1.1, which comes with the System 7.5 Update 2.0, will not allow the fragmenting of TCP/IP packets.

MacTCP 2.0.6 does not set the Don't Fragment (DF) bit and allows packet fragmentation, however, Open Transport 1.1 does set the DF bit. This may be an issue because some TCP/IP devices reject this. Can you confirm or deny this as an issue without traces?

DISCUSSION -----

Open Transport supports a new IP feature called MTU Path Discovery. The MTU Path Discovery algorithm does set the DF bit on all packets as long as the minimum datagram size (576) is not the current MTU. The DF bit is set on all packets so that in the event that the route changes, which could cause the MTU to change, the sender will receive an ICMP "packet too large" datagram from a router and adjust the MTU. The only time the DF bit is not set is when the minimum (576) size datagram is being used.

We are not aware of any problems using MTU Path Discovery or setting the DF bit with any IP implementations.

Here is a summary of how this all fits together from rfc 1191:

1. Introduction

When one IP host has a large amount of data to send to another host, the data is transmitted as a series of IP datagrams. It is usually preferable that these datagrams be of the largest size that does not require fragmentation anywhere along the path from the source to the destination. (For the case against fragmentation, see [5].) This datagram size is referred to as the Path MTU

(PMTU), and it is equal to the minimum of the MTUs of each hop in the path. A shortcoming of the current Internet protocol suite is the lack of a standard mechanism for a host to discover the PMTU of an arbitrary path.

NOTE: The Path MTU is what in [1] is called the "Effective MTU for sending" (EMTU_S). A PMTU is associated with a path, which is a particular combination of IP source and destination address and perhaps a Type-of-service (TOS).

The current practice [1] is to use the lesser of 576 and the first-hop MTU as the PMTU for any destination that is not connected to the same network or subnet as the source. In many cases, this results in the use of smaller datagrams than necessary, because many paths have a PMTU greater than 576. A host sending datagrams much smaller than the Path MTU allows is wasting Internet resources and probably getting sub-optimal throughput. Furthermore, current practice does not prevent fragmentation in all cases, since there are some paths whose PMTU is less than 576.

2. Protocol overview

In this memo, we describe a technique for using the Don't Fragment (DF) bit in the IP header to dynamically discover the PMTU of a path. The basic idea is that a source host initially assumes that the PMTU of a path is the (known) MTU of its first hop, and sends all datagrams on that path with the DF bit set. If any of the datagrams are too large to be forwarded without fragmentation by some router along the path, that router will discard them and return ICMP Destination Unreachable messages with a code meaning "fragmentation needed and DF set" [7]. Upon receipt of such a message (henceforth called a "Datagram Too Big" message), the source host reduces its assumed PMTU for the path.

The PMTU discovery process ends when the host's estimate of the PMTU is low enough that its datagrams can be delivered without fragmentation. Or, the host may elect to end the discovery process by ceasing to set the DF bit in the datagram headers; it may do so, for example, because it is willing to have datagrams fragmented in some circumstances. Normally, the host continues to set DF in all datagrams, so that if the route changes and the new PMTU is lower, it will be discovered.

Unfortunately, the Datagram Too Big message, as currently specified, does not report the MTU of the hop for which the rejected datagram was too big, so the source host cannot tell exactly how much to reduce its assumed PMTU. To remedy this, we propose that a currently unused header field in the Datagram Too Big message be used to report the MTU of the constricting hop. This is the only change specified for routers in support of PMTU Discovery.

Disk First Aid: What Does It Do? (3/96)

Revised: 3/27/96
Security: Everyone

Disk First Aid: What Does It Do? (3/96)

=====

Article Created: 27 March 1996

TOPIC -----

What are the meanings of all the messages that appear while Disk First Aid is checking my hard drive? For what type of errors does Disk First Aid check?

DISCUSSION -----

The information in this article is taken from the book "Inside Macintosh."

Disk First Aid ensures the integrity of individual files on a volume cataloged by Hierarchical File Structure (HFS - the method for placing data on a hard drive used by the Mac OS).

A disk can contain several partitions, which are treated as separate virtual disks by the system. Each partition contains information similar to that shown below:

Begin_Graphic

```

.....
Partition Information .
.....
Disk Driver Partition
.....
Boot Blocks .
.....
Master Directory Block(MDB). Macintosh Partition
.....
Volume Bitmap .
.....
Catalog File .
.....
Extents Overflow File .
```

```
..... |
Files/Free Space . |
..... |
Alternate MDB . |
..... -----
..... Other Partitions
..... -----
```

End_Graphic

Partition Map

The first physical block (512K) contains the disk's "Partition Map". This specifies the first and last physical blocks of each partition as well as its type (Macintosh, A/UX, MS-DOS, etc.). It also contains the value for the size of "Logical Blocks." Physical blocks are always 512K. The logical block size will vary depending upon the capacity of the drive. Whenever a file is written to the disk, it is allocated a certain number of logical blocks or "clumps." This slows down the process of fragmentation, but can result in open space being left at the end of the file allocation.

Device Driver

After the partition map is the device driver used for SCSI communications with that device. (Note that if the device driver is updated after the drive is initialized, HFS may move the driver to the end, depending on space constraints).

Boot Blocks

The HFS volume begins with two boot blocks. This is where booting instructions are stored along with directions for locating the system and Finder files.

Master Directory Block

Contains volume information such as the date and time of volume's creation and number of files the volume contains. When the MDB is read, the volume is mounted and an area is created in memory called the Volume Control Block (VCB).

Volume Bitmap

A record of which logical blocks in the volume are allocated to files. It contains one bit for each allocation block on the volume. If the block is taken then the bit is set. Otherwise, the bit is clear if the block is available.

Catalog File/Tree

Contains hierarchical information about the relationship and structure of files and folders and their location on a volume.

Specifically, it contains the parent directory for each file. In order to determine the full path, a directory's parent is found, and so on, until the

root level is reached. The Catalog File and Extents File are each in the form of a "B-Tree" (and are the source for all B-Tree type errors). See below for a discussion of B-Trees.

Extents File/Tree

An "Extent" is a contiguous range of logical blocks that are allocated to a file. The Extents File (also called "Extents Overflow File") keeps track of the location of records that can't be placed contiguously. This information is used to locate pieces of a file when it's loaded. Some Extent information is contained within the MDB and VCB. The first three file extents are always retained in memory with the VCB.

Given the above information it is understandable why optimizing, or "defragmenting" a disk is so effective. Not only does making files contiguous reduce seek time, but continual accesses to the Extents File are eliminated – all of the needed information is already in memory.

All of the items listed before the Catalog and Extents Files are contiguous. The Catalog and Extents Files can be anywhere on the volume and are not contiguous.

The Catalog File also stores Finder information for each file. This information consists of:

File Type - Identifier of one of several categories.

File Creator - Name of the application that created it.

Finder Flags - These are information items (bits) that can be set to on or off.

The Finder takes these into account when it reads them. The specific types of Finder flags are:

- isInvisible: File won't appear in dialog listings or windows.
- hasBundle: File is associated with a custom icon.
- nameLocked: File can't be renamed or have another icon assigned to it by a user.
- isStationery: File is a stationery pad.
- isShared: File is being shared over a network.
- hasCustomIcon: File has it's own customized icon.

Files Location in Window - Relative position in the window when it's opened.

Directory that Contains File - The directory path of the file.

The rest of the volume contains application/data files, the Catalog File, Extents Overflow File, and open space.

A Discussion of B-Trees

=====

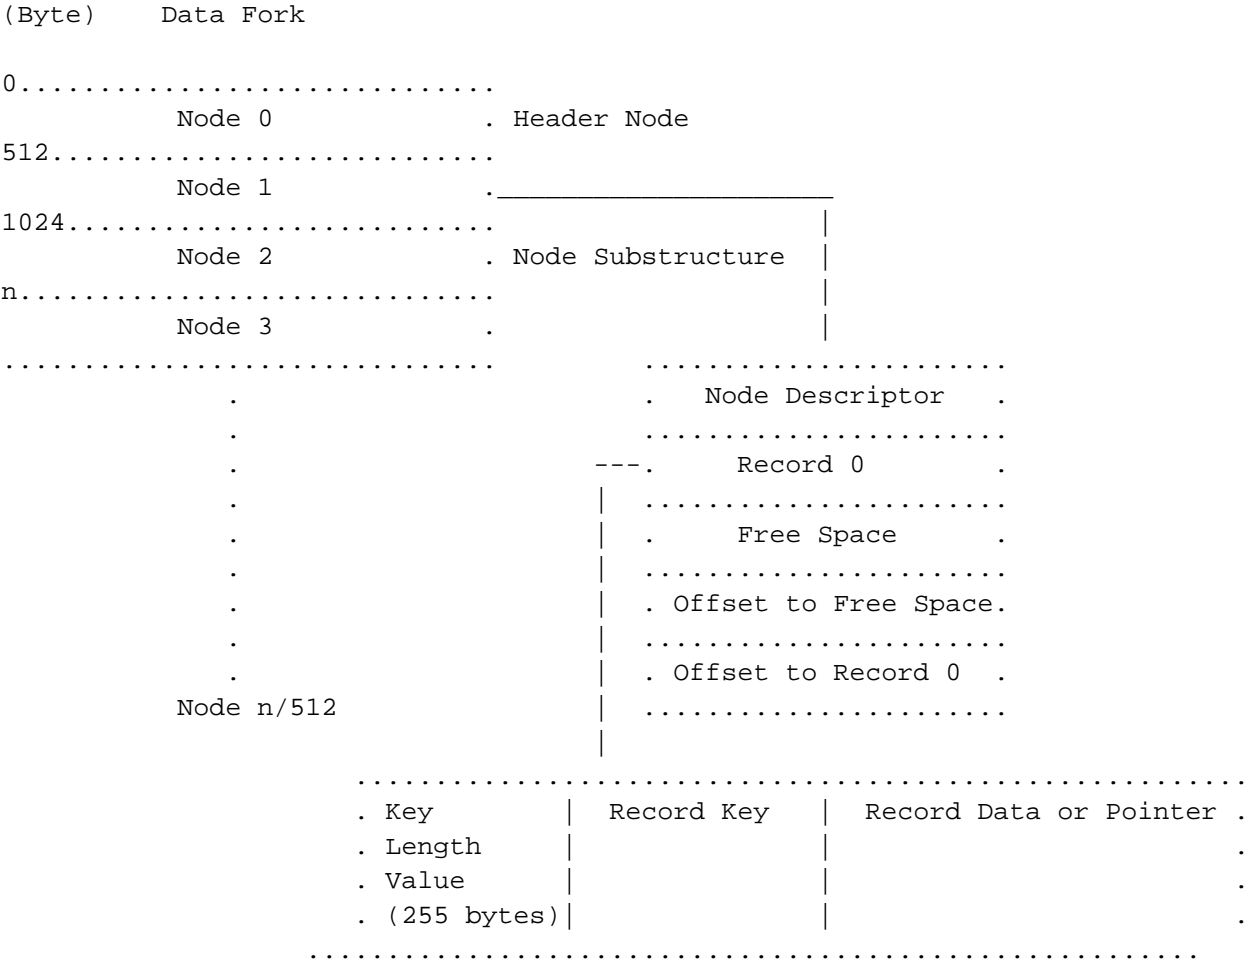

Catalog and Extents files are organized into B-Trees, a structure which allows for optimum read speeds.

Both of these files contain only data forks – there are no resource forks. The

location of the start of the Catalog and Extents B-Tree is contained at the beginning of the MDB and is stored in memory.

Below is a rough diagram of what the disk structure of the Catalog and Extents Files look like:

Begin_Graphic

An example of a B-Tree structure is shown below:

End_Graphic

This goes a long way to explain how and why errors occur. B-Tree structures are

complex. If one becomes damaged, erroneous information is read into File Manager and the referenced files can also become damaged. This is why it's vital to run Disk First Aid or similar utilities on a regular basis.

Typical Errors Detected by Disk First Aid
=====

Below are some typical errors generated by Disk First Aid with explanations:

Keys Out of Order

B-Tree records or referenced records have become damaged.

Bad Leaf Node/Index Node

A node has been changed so it doesn't correctly refer to other nodes or records.

B-Trees Damaged

This is obvious - the B-Trees are damaged.

Volume Bitmap Incorrect

The volume bitmap does not accurately reflect the use of allocation blocks on the drive. Disk First Aid repairs this and the extents file by comparing the two with each other, then comparing against the actual allocation blocks on the drive.

Bundle Bits Need to be Reset

The Bundle Bit flag needed to reset for some of the files. (Other flags may also need to be reset).

AppleShare Workstation 3.6.1 to 3.6.2 Changes (3/96)

=====

Article Created: 27 March 1996

TOPIC -----

This article describes the changes in AppleShare Workstation software from version 3.6.1 to 3.6.2.

DISCUSSION -----

The AppleShare Workstation 3.6.2, changes from 3.6.1 are:

- Changes the behavior of the Alias Manager, included with System 7.5.3 and System 7.5 Update 2.0, to use the workstation user interface for Alias resolution. Set Password Button now available.
- Fixes several hangs due to VBL (vertical blanking interrupt) problems.
- Fixes a crash on launch of certain applications from the server.
- When you get a Bad Password error, the workstation now asks you to check the Caps Lock key if it was active when you entered the password.

Microsoft Bookshelf: Please Insert The CD Message (4/96)

=====

Article Created: 28 March 1996
Article Reviewed/Updated: 2 April 1996

TOPIC -----

I got the Microsoft Bookshelf application with the Library Research Software Bundle from Apple. Why do I get an error message asking me to insert the Microsoft Bookshelf CD-ROM disc when it is in the drive already?

DISCUSSION -----

The Microsoft Bookshelf CD is included with the following software bundles from Apple:

- Library Research Bundle
- Multimedia Learning Tools Bundle

Some early versions of the CD were improperly mastered which is the reason for the error message.

Please call 800-SOS-APPL to get the newer version of this CD.

LaserWriter IISC: No Printer Driver in Sys7.5 Update 2.0 (3/96)

Revised: 3/28/96
Security: Everyone

LaserWriter IISC: No Printer Driver in Sys7.5 Update 2.0 (3/96)

=====

Article Created: 28 March 1996

TOPIC -----

I just installed the System 7.5 Update 2.0, and I could not find a printer driver for the LaserWriter IISC printer. What happened to that driver?

DISCUSSION -----

The LaserWriter IISC driver is not compatible with System 7.5.3 (System 7.5 with Update 2.0).

When printing to a LaserWriter IISC or Personal LaserWriter SC from a Macintosh running System 7.5.2 or 7.5.3, the print output may not be WYSIWYG depending upon the font selected. The output is not WYSIWYG due to improper character and word spacing. The improper spacing may also cause lines to get clipped. Clipping is where characters that lie outside the printable area are not printed.

The situation gets more confusing since the printer drivers are referenced in the System 7.5.3 "About the Extensions folder" ReadMe:

- LaserWriter IISC: Enables your computer to print documents on a LaserWriter IISC connected to a SCSI port. Replaced by Personal LaserWriter SC.
- Personal LaserWriter SC: Enables your computer to print documents on a Personal LaserWriter SC or a LaserWriter IISC.

Workarounds

At this time there is only two workarounds; if you use System 7.5.3, you should use QuickDraw GX and the appropriate QuickDraw GX printer driver. The only other option if you do not want to install QuickDraw GX is to use another version of the Mac OS prior to System 7.5.2 or System 7.5.3.

If you want to continue using System 7.5.3, and you do not want to use QuickDraw GX you can experiment with different fonts in various applications. You should

be able to find a font that provides acceptable results.

Macintosh IIVx: Replacing Logic Board, Buzzing Sound (3/96)

=====

Article Created: 28 March 1996

TOPIC -----

After installing a new logic board in a Macintosh IIVx, the computer no longer makes the usual startup chime, it buzzes for three seconds. Then with power staying on, no video is displayed. What is wrong?

DISCUSSION -----

You need to install VRAM on the logic board. Once this is done the computer should startup in a normal fashion.

DOS Compatible Card: Open Transport or Classic Network (6/96)

=====

Article Created: 28 March 1996
Article Reviewed/Updated: 21 June 1996

TOPIC -----

After installing the System 7.5 Update 2.0, I am unable to do networking from the DOS side of my Power Macintosh 6100 DOS Compatible. I have also tried this on an LC 630 DOS Compatible and a Performa 640 DOS Compatible. None of these are able to do networking with Open Transport, but they work properly with Classic networking.

DISCUSSION -----

Apple has released version 1.5 of the DOS Compatibility software and strongly recommends that all owners of previous version of DOS Compatibility cards (except the Macintosh Centris/Quadra 610 DOS Compatibility Card), upgrade to this version of software. This software requires an upgrade to Mac OS 7.5.3 with System 7.5 Update 2.0. With the Power Macintosh 6100, Macintosh LC 630, and Macintosh Performa 640 DOS Compatibility cards, Classic networking must be chosen instead of Open Transport.

- If you have a PCI-based computer, you need DOS Compatibility software 1.5, System 7.5.3, and use Open Transport 1.1. Version 1.5 of the DOS Compatibility Software ships with the PC Compatibility Cards.
- If you have a Non-PCI-based computer (for example, a Power Macintosh 6100 DOS Compatible, LC 630 DOS Compatible, or Performa 640 DOS Compatible), you need DOS Compatibility software 1.5, System 7.5.3, and use Classic networking by selecting this option in the Network Software Selector found in the Apple Extras folder.

Power Macintosh 7200/120: Description (7/96)

Article Created: 28 March 1996
Article Reviewed/Updated: 12 July 1996

TOPIC -----

This article contains a description of the Power Macintosh 7200/120 series of computers.

DISCUSSION -----

Apple's Power Macintosh 7200/120 combines affordability with high performance to provide an ideal system for small and medium-size businesses, for home offices, and for running productivity applications in any size of organization. Based on high-performance RISC technology, the Power Macintosh 7200/120 computer features a 120-megahertz PowerPC 601 processor. And if your performance needs later increase, this system can be upgraded to a Power Macintosh 7600/120 system, which features video-input capabilities and processor upgradability.

The three industry-standard Peripheral Component Interconnect (PCI) expansion slots on the Power Macintosh 7200/120 let you customize the Power Macintosh 7200/120 computer easily to more precisely meet your needs. You can find many PCI cards for a variety of uses, including graphics, storage, and high-speed networking. And if you want to use your Power Macintosh 7200/120 to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install an Apple PC Compatibility Card in one of the system's PCI slots--and switch instantly between the two computing environments.

Connecting your Power Macintosh 7200/120 computer to an Ethernet network is easy, because it includes both AAUI and 10BASE-T connectors. With an optional PC Compatibility Card, you can connect both the card and Power Macintosh to a network simultaneously.

Today, more and more computer users are discovering the wealth of information, and communications resources, and opportunities offered by the Internet. The Power Macintosh 7200/120 makes it easy to get involved in this rapidly expanding community, because it comes with all of the software you need for easy Internet

access.

So whether you need power and expandability for everyday number crunching, office productivity, or an innovative multimedia project--or want a fast, easy way to get started with the Internet--the Apple Power Macintosh 7200/120 offers the features you need at an affordable price.

Features

=====

High performance

- * 120-MHz PowerPC 601 processor
- * Built-in floating-point processor and 32K cache
- * 256K level 2 cache (standard on some configurations)
- * Built-in graphics acceleration

Communications and multimedia

- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * Quadruple-speed or 8x-speed CD-ROM drive, depending on configuration
- * 16-bit stereo audio input and output

Expandability

- * Three industry-standard PCI expansion slots
- * SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bay for additional storage device
- * Up to 256 MB of RAM
- * Up to 4 MB of VRAM

Compatibility

- * Includes 10BASE-T and AAUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs most 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- * Comes with all of the software required for Internet access

System 7.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide

=====

- * 120-MHz PowerPC 601 microprocessor
- * Integrated floating-point unit and 32K cache

Memory

=====

- * 8 MB or 16 MB of RAM, expandable to 256 MB via 4 DIMM sockets
- * 4 MB of ROM
- * Optional 256K level 2 cache

Disk drives

=====

- * Internal 1.2 GB SCSI hard disk
- * Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal quadruple-speed or 8x-speed CD-ROM drive, depending on configuration
- * Expansion bay for additional 3.5-inch hard disk or other SCSI device

Interfaces

=====

- * Three PCI expansion slots compatible with PCI 2.0-compliant cards
- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables

- * 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- * Internal/external SCSI bus (up to 5MB/s)
- * Apple Desktop Bus (ADB) expansion port
- * Mini jacks for stereo audio input and output
 - 16-bit audio
 - Up to 44.1-kHz sampling rate
- * DB-15 connector for monitor

Graphics support

=====

- * VRAM-based accelerated graphics
- * 1MB of VRAM, expandable to 4MB
- * 64-bit data path to VRAM (with 2MB of VRAM)
- * Support for display resolutions of up to 1,280x1,024 pixels
- * 24-bit color up to 1,024x768 resolution
- * Refresh rate of up to 75 Hz

Audio System

=====

- * Custom sound circuitry, including stereo generator (digital-to-analog converter, or DAC)—capable of driving stereo miniplug headphones or audio equipment—and stereo sampling hardware (analog-to-digital converter, or ADC) for recording stereo sound
- * 16-bit stereo input and output
- * Sample rates of 44.1 and 22.05 kilohertz (kHz)
- * Input line level: 2 volts peak-to-peak nominal, into 6.5-Kilohm (k) impedance
- * Output line level: 2.2 volts peak-to-peak nominal, into 1 k impedance
- * Input through output SNR**: >74 decibels (dB) typical
- * Bandwidth: 10 Hz-19 kHz (+/- 2 dB) at 44.100 kHz sample rate
- * THD+N*: Less than 0.06%; measured 30 Hz-16 kHz with a 2-Vpp sine wave input
- **SNR is signal-to-noise ratio; THD+N is total harmonic distortion plus noise.

Clock/calendar

=====

- * Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- * Supports ADB keyboards with numeric keypads
- * Comes with an ADB Mouse II

Electrical requirements and compliance

=====

- * Line voltage: 100 to 240 V AC, RMS single phase
- * Frequency: 50 to 60 Hz, single phase
- * Power: 150 W maximum, not including display
- * EPA Energy Star compliant

ADB power requirements

=====

- * Maximum current draw for all devices: 500 mA
(a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- * Height: 6.15 in. (15.6 cm)
- * Width: 14.37 in. (36.5 cm)
- * Depth: 16.93 in. (43.0 cm)
- * Weight: 22 lb. (9.97 kg)

Environmental requirements

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Apple Internet Router 3.0.1 and System 7.5.3 Issue (4/96)

Revised: 4/15/96
Security: Everyone

Apple Internet Router 3.0.1 and System 7.5.3 Issue (4/96)

=====

Article Created: 29 March 1996
Article Reviewed/Updated: 15 April 1996

TOPIC -----

This article describes an issue which appeared after installing the System 7.5 Update 2.0 on a Macintosh computer running the Apple Internet Router (AIR) v3.0.1 software.

DISCUSSION -----

We found the SNMP (Simple Network Management Protocol) component, contained in the Network Management package of the AIR v3.0.1 installer, was causing the issue.

Here is a workaround you can use. As long as you follow the instructions below when installing AIR v3.0.1, it should make no difference if AIR v3.0.1 is installed before or after System 7.5 Update 2.0.

- When installing AIR 3.0.1 always choose Custom install, and only select Basic Connectivity and Half Routing if you need Half Routing.
- During the AIR v3.0.1 installation, you will be asked if you want to replace the Network control panel with the older version in the installer. Choose to keep the newer version of the Network control panel.

NOTE: If you performed an Easy Installation of AIR v3.0.1 after installing System 7.5 Update 2.0, you will need to preform a clean installation of system software to 7.5.3 (clean install System 7.5, then install System 7.5 Update 2.0). This is due to system software being modified during an Easy Install of AIR v3.0.1. Once a clean installation of system software is complete, follow the workaround instructions above.

System 7.5 Update 2.0: Installer May Not Use All Disks (4/96)

Revised: 4/9/96
Security: Everyone

System 7.5 Update 2.0: Installer May Not Use All Disks (4/96)

=====

Article Created: 29 March 1996
Article Reviewed/Updated: 9 April 1996

TOPIC -----

While going through the installation procedure for System 7.5 Update 2.0, I noticed that not every disk was required. However, it seems to have installed everything. Why didn't I need all of the disks?

DISCUSSION -----

The System 7.5 Update 2.0 installer may not use all of the disks during installation. This is a normal behavior of the installer, and which disks are used depends on the type of computer and software you have pre-installed and whether you do an Easy or Custom Install.

Macintosh Computers: Excessive Disk Activity at Startup (5/96)

Revised: 5/2/97
Security: Everyone

Macintosh Computers: Excessive Disk Activity at Startup (5/96)

Article Created: 29 March 1996
Article Reviewed/Updated: 2 May 1997

TOPIC -----

Following a system freeze, why does my Macintosh computer take so long to reach the "Welcome to Macintosh" screen in the startup process?

DISCUSSION -----

In general, the startup process will likely take longer on Macintosh computers with a lot of RAM and hard drive storage space. At startup, both the memory and the integrity of the hard drives are checked. The memory check validates and determines how much memory is present. So, a computer with 256 MB of memory will take somewhat longer to startup than a 16 MB computer. Additionally, the status of the "file system dirty" flag is checked to determine the integrity of the hard drives.

The "file system dirty" flag is set in the file system disk structures when a disk or partition is opened and mounted. This flag indicates that some active disk structures are RAM resident, that files open for output are present, and that data needs to be flushed to the drive when the volume is closed and dismounted. In the normal shutdown process, the Finder flushes all RAM-resident disk structures to the disk, closes and dismounts the volume, and resets the "file system dirty" flag.

The major difference between a normal and abnormal restart (after a system freeze) is the validation of the integrity of the disk file system. If this flag has not been reset, then it is assumed that a proper close and dismount by the Finder did not occur. The state of the file system data structures are in doubt because there may have been open files for output when the crash occurred. At this point, the drive is checked to ensure the integrity of the disk file structures. This process takes longer if you have a larger hard drive and/or have a lot of files on the hard drive. The normal startup process is faster because the volume integrity is assured and no recovery checking is necessary.

All SCSI drives attached to the computer are checked in this manner. For the startup volume, this process happens before "Welcome to Macintosh". For the other volumes, this process happens as the Finder launches. Thus, you are likely to see a further delay, accompanied by intensive disk activity, as the Finder launches.

So, to avoid losing or corrupting files, Apple recommends that you shutdown the computer by selecting Shutdown from the Special or Apple menus.

CLW 12/600 PS: Supported Paper Sizes & Margins (10/96)

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS: Supported Paper Sizes & Margins (10/96)

Article Created: 29 March 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

This article provides the supported paper sizes and imageable areas of the Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS printers.

DISCUSSION -----

The Color LaserWriter supports printing on US Letter, Legal, A4, and B5 paper sizes. The US version of the Color LaserWriter ships with a 250-sheet US Letter cassette. Legal, A4, and B5 paper sizes can be fed using the included 100 sheet capacity multi-purpose tray. An optional 250-sheet universal cassette tray (M3874G/A) that supports US Letter, Legal, A4, and B5 can be purchased separately. The optional 250-sheet stackable feeder (M3762G/A) includes the universal cassette tray. Full bleed and tabloid printing are not supported by the Color LaserWriter 12/600 PS printer.

The following tables lists the supported paper sizes and their imageable areas when using the LaserWriter 8.3.x drivers. Other paper sizes are not supported due to the design characteristics of the print engine. All of the values are listed in inches.

Begin_Table

+=====+							
Paper Size	Standard Imageable Area			Standard Margins			
	Width	Height	Top	Bottom	Left	Right	
+=====+							
Letter	7.67	10.49	.43	.43	.43	.40	
+-----+							
Legal	6.72	12.50	.75	.75	.89	.89	
+-----+							
A4	7.47	10.84	.42	.43	.40	.39	

B5	6.79	9.62	.32	.19	.19	.19	

Paper	Maximum Imageable Area		Maximum Margins				
Size							
	Width	Height	Top	Bottom	Left	Right	
Letter	8.32	10.14	.32	.19	.19	.19	
Legal	8.32	13.49	.32	.19	.19	.19	
A4	7.89	11.18	.32	.19	.19	.18	
B5	NA	NA	NA	NA	NA	NA	

End_Table

AMTPE: Installation Corrections (3/96)

Revised: 3/29/96
Security: Everyone

AMTPE: Installation Corrections (3/96)

Article Created: 29 March 1996

TOPIC -----

I purchased the Apple Media Tool Programming Environment (AMTPE), and cannot install the product on my hard disk properly. I am following the installation instructions included with the product, but they are somewhat confusing.

DISCUSSION -----

There are a couple of things you need to do that the installation instructions do not cover.

Step 1

Drag the Folder called MPW from the CD-ROM to your hard disk.

On page 2-2 of Getting Started the manual tells you to drag the folder called MPW for AMTPE from the CD-ROM to your Macintosh. However, the folder is named MPW on the CD-ROM, not MPW for AMTPE.

Step 2

Drag the Contents of AMTPE Mac from the CD-ROM to your hard disk.

The folders Key, and Standard and Minimal Engines are in the AMTPE Mac folder. These folders are required later in the installation process.

Step 3 - Power Macintosh Users Only

If you are using a Power Macintosh computer, you need to drag the StdCLibInit from the System Folder Additions folder to your Macintosh System Folder, then restart your computer.

This step is missing from the original documentation.

Manual Error

On page 2-4 under Initializing Your AMTPE Tools, step 3 should say click the Directory button, not click the Select Current Directory button.

Once you get everything right in the MPW folder then it works properly.

System 7.5 Update 2.0: Universal System Folder (9/96)

Revised: 9/11/96
Security: Everyone

System 7.5 Update 2.0: Universal System Folder (9/96)

=====

Article Created: 29 March 1996
Article Reviewed/Updated: 11 September 1996

TOPIC -----

This article contains questions about creating and using the Universal System Folder in System 7.5.3.

Questions Answered in this Article:
=====

- 1) Why would I want to create a universal System Folder?
- 2) How can I create a universal System Folder using the installer included with System 7.5 Update 2.0?
- 3) How much space does the universal System Folder require on a volume? I attempted to install it on a 44 MB removable cartridge, but I didn't have enough room.
- 4) I created a universal System Folder and tried to startup my computer. However, it is locking up as the extensions load at startup. What's going on?
- 5) Why can't I create a universal System Folder using System 7.5.1 or System 7.5.2?
- 6) I noticed that the Power Macintosh 5400/120 computer includes System 7.5.3 Revision 2. Can I install and use the Universal System Folder on this computer?

DISCUSSION -----

- 1) Question: Why would I want to create a universal System Folder?

Answer: Only some users need a universal System Folder. You might want to create a universal System Folder if you

- start up different Macintosh models using removable media
- want to simplify support of multiple users by giving all users the same System Folder
- prefer to start up computers using an external startup disk

If you are responsible for only one computer, you shouldn't need to create a universal System Folder.

2) Question: How can I create a universal System Folder using the installer included with System 7.5 Update 2.0?

Answer: To create a universal System Folder, you must start with System 7.5. The procedure will not work if you start with System 7.5.1 or 7.5.2. (You cannot install System 7.5 on a computer that requires 7.5.2 or greater.)

These steps assume you're not installing the software on your startup drive. A universal System Folder can be created on your startup drive, but you'll be forced to restart after each installation. By installing onto another drive, you can avoid several restarts.

Step 1

Open the System 7.5 Installer (the Installer for version 7.5.0 of the system software).

Step 2

When you see the Installer's welcome screen, click Continue.

Step 3

Choose Custom Install from the pop-up menu in the upper-left corner of the dialog box.

Step 4

Click Switch Disk until the name of the desired destination disk appears.

Step 5

Click the triangle on the left side of the first item in the list.

Step 6

Click the box next to "System for any Macintosh" to put an "X" in it.

Step 7

In the list, click the triangle to the left of Utility Software, then click the box next to AppleScript to put an "X" in it.

If you are creating the universal System Folder on a disk that did not already

have a System Folder on it, skip step 8.

Step 8

If you are creating the universal System Folder on a disk with a System Folder on it, hold down the Command and Shift keys while pressing the K key. Click to select the button labeled Install New System Folder and then click OK.

Step 9

Click Clean Install (or Install, if you skipped step 8) and wait for the installation to finish (inserting disks as needed).

If the destination disk had a System Folder on it, the contents of your old System Folder have been moved to a new folder titled Previous System Folder.

Step 10

Insert the System 7.5 Update 2.0 CD or the first update floppy, disk and open the System 7.5 Update Installer.

Step 11

When you see the Installer's welcome screen, click Continue.

Step 12

Choose Custom Install from the pop-up menu in the upper-left corner of the dialog box.

Step 13

Click Switch Disk until the name of the desired destination disk appears.

Step 14

Click the Universal Update box to put an "X" in it.

If you don't see this option, make sure that you've done the previous steps correctly.

Step 15

Click the Install button and wait for the installation to finish (inserting disks as needed).

3) Question: How much space does the universal System Folder require on a volume? I attempted to install it on a 44 MB removable cartridge, but I didn't have enough room.

Answer: On a 44 MB volume, the universal System Folder will take approximately 36.3 MB. So, you should be able to install it successfully. It is possible that

you selected "System for any Macintosh" and then selected all the other options in the Custom Install window. This may seem logical, but it is not necessary. Be sure to carefully follow the directions for creating the universal System Folder.

4) Question: I created a universal System Folder and tried to start up my computer. However, it is locking up as the extensions load at startup. What's going on?

Answer: The universal System Folder may include items which are not needed for a particular Macintosh computer. These additional items should be inert and have no effect. However, it is possible that you may need to start up with the Space Bar down (to open the Extensions Manager control panel) and disable unused extensions and control panels.

5) Question: Why can't I create a universal System Folder using System 7.5.1 or System 7.5.2?

Answer: To create a universal System Folder, the System 7.5 Update 2.0 installer simply updates an already existing universal System Folder. However, the only previous installer capable of creating a universal System Folder was the System 7.5 installer. Because System 7.5.1 and System 7.5.2 installers are incapable of making a universal System Folder, you must start with a System 7.5 universal System Folder.

6) Question: I know that the Power Macintosh 5400/120 came out after System 7.5 Update 2.0, but I was wondering if I could install and use the Universal System Folder on this computer?

Answer: No, you cannot use the Universal System Folder with the Power Macintosh 5400/120 computer. The Power Macintosh 5400 computer uses a version of the system software that is newer than System 7.5.3 created with System Update 2.0. Additionally, this computer cannot use System 7.5, which is required to make the Universal System Folder (as explained in Question 6).

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). System 7.5 Update 2.0: AppleVision Software Version (3/96)

Revised: 3/29/96
Security: Everyone

System 7.5 Update 2.0: AppleVision Software Version (3/96)

=====

Article Created: 29 March 1996

TOPIC -----

I have an AppleVision display, I am confused over which version of the AppleVision software I should be using since I installed the System 7.5 Update 2.0 software.

DISCUSSION -----

If you use AppleVision software, use version 1.0.2 or later. Earlier versions of AppleVision are not compatible with System 7.5 Update 2.0.

If you have a 1710AV monitor and a PCI-based computer, use AppleVision 1.0.4 and the Monitors & Sound control panel.

If you have a 1710AV monitor and a non-PCI-based computer, use AppleVision 1.0.2, the Sound control panel, and the Monitors control panel.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

PowerShare and Open Transport 1.1 Incompatible (3/96)

Revised: 3/30/96
Security: Everyone

PowerShare and Open Transport 1.1 Incompatible (3/96)

=====

Article Created: 30 March 1996

TOPIC -----

This article describes an incompatibility issue between Open Transport 1.1 and PowerShare.

DISCUSSION -----

There is an incompatibility between PowerShare and Open Transport 1.1. It has to do with making synchronous versus asynchronous calls, and it is an issue with PowerShare. It is a periodic bug -- things might work for a while but inevitably, the system will hang. Also, there is not an easy fix. The code that makes the Open Transport incompatible calls is spread throughout PowerShare.

In short, PowerShare and Open Transport are not compatible. Apple has identified the problem, however, there is no known date when a fix will be available.

This article was published in the Information Alley on 1 Apr 1996.

PowerShare and System 7.5.3 Incompatible (3/96)

Revised: 3/30/96
Security: Everyone

PowerShare and System 7.5.3 Incompatible (3/96)

=====

Article Created: 30 March 1996

TOPIC -----

Is PowerShare compatible with System 7.5.3?

DISCUSSION -----

PowerShare has not been tested and is not supported with System 7.5.3. In addition, there are known incompatibilities between PowerShare and Open Transport 1.1. Also, there are no benefits to be gained by running a PowerShare server with System 7.5.3.

Therefore Apple strongly recommends that you do not update a PowerShare server to System 7.5.3 with the System 7.5 Update 2.0.

AppleShare Print Server and GeoPort Software Issue (3/96)

Revised: 3/30/96
Security: Everyone

AppleShare Print Server and GeoPort Software Issue (3/96)

=====

Article Created: 30 March 1996

TOPIC -----

AppleShare 4.0.2 Print Server appears to have a software conflict with the GeoPort Express Modem software. When I try to capture a LaserWriter printer from my Workgroup Server 8150 with the Express Modem control panel active I get the message, "Having difficulties connecting to the printer."

Is this a known issue? Is there a known workaround?

DISCUSSION -----

This is a known issue, and it has been reported to Apple Engineering. The issue was found to be with the AppleShare Print Server software. A fix for this issue may be in future versions of Print Server software, however, there is no known date when this fix may appear.

You have to choose between having the server run Apple Telecom software or AppleShare Print Server software.

Power Macintosh 7200 PC Compatible: Specifications (10/96)

Revised: 10/28/96
Security: Everyone

Power Macintosh 7200 PC Compatible: Specifications (10/96)

Article Created: 1 April 1996
Article Reviewed/Updated: 28 October 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 7200/120 PC Compatible computer.

DISCUSSION -----

Microprocessors & RAM
=====

Power Macintosh

- 120-MHz PowerPC 601 with integrated floating-point unit and 256K level 2 cache
- 8 MB or 16 MB of RAM (depending on configuration), expandable to 256 MB via three DIMM expansion slots (total of 4 DIMM slots)

PC Compatibility Cards

- Pentium 100-MHz with integrated floating-point unit and 256K level 2 cache
- 8 MB of RAM, expandable to 72 MB on Pentium (8 MB on board, one free DIMM slot)

- or -

- 586 Processor 100-MHz with integrated floating-point unit and 128K level 2 cache
- 64 MB on 586 PC Compatibility Card (has one DIMM slot which comes with one 8 MB DIMM installed)

Disk drives
=====

- Built-in 1.4MB Apple SuperDrive floppy disk drive
 - Accepts high-density floppy disks
 - Reads, writes, and formats Mac OS, Windows, and MS-DOS floppy disks
 - Supports Distributed Media Format (DMF) for floppy disks
- Internal 1.2 GB hard disk
- Internal AppleCD 600i quadruple-speed CD-ROM drive or 8x-speed (depending on configuration)
- Expansion bay for additional 3.5-inch hard disk or other peripheral

Video support

=====

- Features built-in support for one or two displays
- Works with all current Apple displays as well as most third-party VGA and SVGA displays (third-party displays may require separate cable adapter)
- 1 MB VRAM, expandable to 4 MB (for Mac OS)
- 1 MB DRAM (for MS-DOS and Windows)
- Display Resolution with 1 MB Video DRAM:

640x480	16.7 million colors
800x600	65,536 colors
1024x768	256 colors

Interfaces

=====

- Three PCI expansion slots (one dedicated to PC Compatibility Card) compatible with PCI 2.0-compliant cards for Mac OS (Note: These slots are not NuBus compatible.)
- Internal/external SCSI bus for connecting up to six external devices
- Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices
- 10Base-T and AAUI-15 Ethernet connectors
- Two PC-compatible serial ports routed under software control to text file or to Macintosh RS-422 serial ports
- Serial port for AppleTalk networking (for Mac OS)
- PC game port (DOS and Windows environments)

Networking

=====

- Support for Novell NetWare SPX/IPX, TCP/IP, and NETBEUI protocols in MS-DOS and Windows environments using the built-in Ethernet connector and ODI and NDIS 2.0 drivers (network client software not included)

Sound

=====

- Custom sound circuitry, including stereo generator (digital-to-analog converter, or DAC)—capable of driving stereo miniplug headphones or audio equipment—and stereo sampling hardware (analog-to-digital converter, or ADC) for recording stereo sound
- 16-bit stereo input and output
- Sample rates of 44.1 and 22.05 kilohertz (kHz)
- Input line level: 2 volts peak-to-peak nominal, into 6.5-Kilohm (k) impedance
- Output line level: 2.2 volts peak-to-peak nominal, into 1 k impedance
- Input through output SNR*: >74 decibels (dB) typical

- Bandwidth: 10 Hz-19 kHz (+/- 2 dB) at 44.100 kHz sample rate
- THD+N*: Less than 0.06%; measured 30 Hz-16 kHz with a 2-Vpp sine wave input
- Mini jacks for stereo audio input and output with 16-bit audio
- Sound Blaster-16-compatible support (for DOS and Windows environment)
- Built-in speaker

*SNR is signal-to-noise ratio; THD+N is total harmonic distortion plus noise.

Keyboard and mouse

=====

- Supports ADB keyboards with numeric keypads
- Includes ADB Mouse II

Clock/calendar

=====

- Custom integrated circuit with long-life battery

Disability access

=====

• CloseView, Easy Access, and ability to substitute visual cue for beep included with Mac OS. These built-in solutions and third-party options provide alternative input and output solutions for people with disabilities.

Electrical requirements

=====

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 210 W maximum, not including monitor power

ADB power requirements

=====

- Maximum current draw for all ADB devices: 500 mA
(a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- Height: 6.2 in. (15.6 cm)
- Width: 14.4 in. (36.5 cm)
- Depth: 16.9 in. (43.0 cm)
- Weight: 22 lb. (9.97 kg) (varies based on internal devices installed)

Environmental requirements

=====

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 7200 PC Compatible: Description (3/97)

Article Created: 1 April 1996
Article Reviewed/Updated: 5 March 1997

TOPIC -----

This article contains a description of the Power Macintosh 7200/120 PC Compatible computer.

DISCUSSION -----

Apple's most versatile personal computers, the Power Macintosh 7200/120 PC Compatible, allows you to run more software than any other mainstream personal computer on the market.

Whether you're in business or education, these Power Macintosh computers not only is the easiest to learn and use, but also gives you the ability to run your favorite Macintosh, MS-DOS, and Windows software. They also lets you switch instantly between these operating environments with just a keystroke.

Offering a breakthrough in power and compatibility, the Power Macintosh 7200/120 PC Compatible features dual microprocessors. The PowerPC provides industry-leading performance for Mac OS applications, while the Pentium (or 586) processor delivers strong performance for MS-DOS and Windows applications.

To help you get even more work done, the Power Macintosh 7200/120 PC Compatible supports two displays without the addition of a video card, so you can see your work in both environments. When using one display, the computer allows you to switch instantly from the Mac OS to MS-DOS and Windows and vice versa, so you can use your favorite Mac OS application while running an MS-DOS or Windows application in the background.

Designed to fit into your environment, the Power Macintosh 7200/120 PC Compatible support the peripherals and network resources you already have. So you can use your Macintosh-compatible printers, modems, and displays with your MS-DOS and Windows applications. And you can connect to any mainstream network from either the Mac OS or MS-DOS and Windows.

The Power Macintosh 7200/120 PC Compatibles also support Sound Blaster-16 compatible multimedia applications, and the internal quadruple-speed or 8x-speed CD-ROM drive runs thousands of Mac OS, MS-DOS, and Windows CD-ROM titles.

The Power Macintosh 7200/120 PC Compatible is easy to expand. It comes with three Peripheral Component Interconnect (PCI) slots (one dedicated to the Pentium or 586 PC Compatibility Card) and nine built-in ports, including an external PC game port—so you can tailor this system to fit your needs.

If you're torn between choosing Macintosh or a Windows-based PC, Apple has made your choice easy: the Power Macintosh 7200/120.

=====

Features

=====

High Performance: Microprocessors & RAM

=====

Power Macintosh

- 120-MHz PowerPC 601 with integrated floating-point unit and 256K level 2 cache
- 8 or 16 MB of RAM (depending on configuration) expandable to 256 MB via three DIMM expansion slots (total of 4 DIMM slots) for Macintosh operating system (Mac OS)

PC Compatibility Cards

- Pentium 100-MHz with integrated floating-point unit and 256K level 2 cache
- 8 MB of RAM, expandable to 72 MB on Pentium (8 MB on board, one free DIMM slot) for MS-DOS and Windows

- or -

- 586 Processor 100-MHz with integrated floating-point unit and 128K level 2 cache
- 64 MB on 586 PC Compatibility Card (has one DIMM slot which comes with one 8 MB DIMM installed) for MS-DOS and Windows

Compatibility

- Runs MS-DOS and Windows applications
- Includes pre-installed Microsoft MS-DOS 6.22
- Compatible with Windows 3.1, Windows for Workgroups 3.11 (not compatible with Windows NT or OS/2)
- Supports single-keystroke switching between Mac OS, MS-DOS, and Windows environments without rebooting
- Opens MS-DOS or Windows files in Mac OS using Macintosh PC Exchange
- Supports copy and paste between Mac OS and Windows
- Includes network support for Netware SPX/IPX, TCP/IP, and NETBEUI protocols
- Prints from MS-DOS and Windows with a Macintosh compatible printer (PostScript

printer recommended for best performance)

- Includes PC game port
- Supports Sound Blaster-16

Flexible display options

- Features built-in support for one or two displays
- Works with all current Apple displays as well as with most third-party VGA and SVGA displays
- 1 MB VRAM, expandable to 4 MB (for Mac OS)
- 1 MB DRAM (for MS-DOS and Windows)
- Supports ATI Mach 64 video in Windows environment

Expandability

- Includes three PCI expansion slots (one dedicated to PC Compatibility Card)
- Includes SCSI connector for up to seven external SCSI peripherals
- Comes with nine built-in ports to support a wide range of peripherals
- Provides expansion bay for additional 3.5-inch storage device

Ordering Information

=====

Power Macintosh 7200/120 PC Compatible

- Order No. M4729LL/A
- PowerPC 601 processor with 8 MB of RAM, 256K level 2 cache to run the Mac OS
- PC Compatibility Card (with Pentium 100-MHz processor, 8MB of RAM, and 256K level 2 cache) to run MS-DOS and Windows
- 1.2 GB hard disk drive
- Internal quad-speed AppleCD 600i CD-ROM drive
- 1.4MB Apple SuperDrive floppy disk drive, and support for Distributed Media Format (DMF) for floppy disks
- System software version 7.5.3
- MS-DOS version 6.22
- Complete setup, learning, and reference documentation
- Limited one-year hardware warranty

Power Macintosh 7200/120 PC Compatible

- Order No. M4898LL/A
- PowerPC 601 processor, 8MB of RAM, 256K level 2 cache
- PC Compatibility Card (with 586 100-MHz processor, 8 MB of RAM, and 128K level 2 cache)
- 1.2 GB hard disk drive
- Internal quad-speed AppleCD 600i CD-ROM drive
- 1.4 MB Apple SuperDrive floppy disk drive, and support for DMF for floppy disks
- System software version 7.5.3
- MS-DOS version 6.22
- Complete setup, learning, and reference documentation
- Limited one-year hardware warranty

Power Macintosh 7200/120 PC Compatible

- Order No. M5443LL/A
- PowerPC 601 processor, 16 MB of RAM, 256K level 2 cache
- PC Compatibility Card (with Pentium 100-MHz processor, 8 MB of RAM, and 128K level 2 cache)
- 1.2 GB hard disk drive
- Internal 8x-speed CD-ROM drive
- 1.4 MB Apple SuperDrive floppy disk drive, and support for DMF for floppy disks
- System software version 7.5.3
- MS-DOS version 6.22
- Complete setup, learning, and reference documentation
- Limited one-year hardware warranty

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Power Macintosh 7600 Logic Board Upgrade Kit*

- Order No. M3842LL/A
- Power Macintosh 7600 logic board with video-input capabilities
- Accessory kit with documentation and a CD-ROM containing system software version 7.5.3

* Requires processor purchase (see Processor Upgrade Card information)

Power Macintosh Processor Upgrade Card

- Order No. M4731LL/A (120 MHz)
- Order No. M4875LL/A (132 MHz)

Article Change History:

05 Mar 1997 - Corrected CPU on M5443LL/A.
28 Oct 1996 - Corrected information.
22 Oct 1996 - Added additional configurations.

Power Macintosh 7600 Series: Description (2/97)

Article Created: 1 April 1996
Article Reviewed/Updated: 6 February 1997

TOPIC -----

This article contains a description of the Power Macintosh 7600 series computers.

DISCUSSION -----

If you need a computer that offers increased performance and expandability for your business, regardless of its size, the Power Macintosh 7600/120 and 7600/132 deliver. With a 120- or 132-megahertz PowerPC 604 RISC processor that you can easily upgrade to an even faster processor, the Power Macintosh 7600/120 and 7600/132 give you all the advantages of PowerPC technology now--with plenty of room to grow later. Built-in video-input capability, high-resolution graphics, and CD-quality stereo sound add vitality to everyday business projects. And because the Power Macintosh 7600/120 and 7600/132 optimize the transfer of video data, they are ideal systems for videoconferencing.

The three industry-standard Peripheral Component Interconnect (PCI) expansion slots on the Power Macintosh 7600/120 and 7600/132 let you customize the computer easily to more precisely meet your needs. You can find many PCI cards for a variety of uses, including graphics, storage, and high-speed networking. And if you want to use your Power Macintosh 7600/120 or 7600/132 to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install an Apple PC Compatibility Card in one of the system's PCI slots--and switch instantly between the two computing environments.

Connecting your Power Macintosh 7600/120 or 7600/132 computer to an Ethernet network is easy, because it includes both AAUI and 10BASE-T connectors. With an optional PC Compatibility Card, you can connect both the card and Power Macintosh to a network simultaneously.

Today, more and more computer users are discovering the wealth of information and communications resources and opportunities offered by the Internet. The

Power Macintosh 7600/120 and 7600/132 make it easy to get involved in this rapidly expanding community, because it comes with all of the software you need for easy Internet access.

Whether you are selecting computers for a large corporation or a single-person home office, the Power Macintosh 7600/120 and 7600/132 systems offer PowerPC performance and PCI expandability giving you the versatility you need for professional computing.

Features

=====

High performance

- * 120-MHz PowerPC 604 processor, user-upgradable to faster processor when available (up to 250 MHz)
- * Built-in floating-point processor and 32K cache
- * 256K level 2 cache
- * Built in graphic acceleration

Communications and multimedia

- * 64-bit VRAM graphics subsystem
- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * Quadruple-speed or 8x-speed CD-ROM drive, depending on configuration
- * 16-bit stereo audio input and output
- * 24-bit composite and S-video input
- * Support for speech-recognition and text-to-speech capabilities
- * Optimized for QuickTime Conferencing software

Expandability

- * Three industry-standard PCI expansion slots
- * SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bay for additional hard disk drive

Compatibility

- * Includes 10BASE-T and AUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs most 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- * Comes with all of the software required for Internet access

System 7.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide

Ordering

=====

Power Macintosh 7600/120

* Power Macintosh 7600/120 computer with 16 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 1.2 GB hard disk drive, an internal quadruple-speed CD-ROM drive, and a PlainTalk microphone. Includes mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

- Order No. M4631LL/A

Power Macintosh 7600/132

* Power Macintosh 7600/132 computer with 16MB of RAM, a built-in 1.4MB Apple SuperDrive floppy disk drive, an internal 1.2GB hard disk drive, an internal 8x-speed CD-ROM drive, and a PlainTalk microphone. Includes mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

- Order No. M5346LL/A

NOTE: This configuration is available ONLY in the Higher Education channel.

PC Compatibility Card Solutions

* Order No. M4092LL/A

- PC Compatibility Card with Pentium 100-MHz processor

* Order No. M4091LL/A

- PC Compatibility Card with 586 100-MHz processor

Power Macintosh Processor Upgrade Card

* Order No. M4875LL/A (132 MHz)

Power Macintosh GeoPort Telecom Adapter

* Order No. M3127LL/C

Apple QuickDraw 3D Accelerator Card

* Order No. M4333LL/A

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Article Change History:

06 Feb 1997 - Corrected reference to different 7600 model.

19 Sep 1996 - Updated processor support information.

12 Jul 1996 - Added additional configuration.

Power Macintosh 7600 Series: Technical Specifications (10/96)

=====

Article Created: 1 April 1996
Article Reviewed/Updated: 15 October 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 7600 series computers.

DISCUSSION -----

Upgradable microprocessor
=====

- * PowerPC 604 microprocessor running at 120 or 132 MHz, upgradeable to a higher-speed processor when available (up to 250 MHz)
- * Integrated floating-point unit and 32K cache
- * High-speed system bus (up to 50 MHz)

Memory
=====

- * 16 MB of RAM, expandable to 512 MB via 8 DIMM sockets
- * 4 MB of ROM
- * 256K level 2 cache

Disk drives
=====

- * Internal 1.2GB SCSI hard disk
- * Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- * Internal quadruple-speed or 8x-speed CD-ROM drive, depending on configuration
- * Expansion bay for additional 3.5-inch hard disk

Interfaces
=====

- * Three PCI expansion slots compatible with PCI 2.0-compliant cards

- * Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- * 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- * Internal Fast SCSI bus (up to 10 MB/s)
- * External SCSI bus (up to 5 MB/s)
- * Apple Desktop Bus (ADB) expansion port
- * RCA phono jacks for line-level stereo audio input and output
- * Mini jacks for stereo audio input and output
- * All sound ports support 16-bit audio and up to 44.1-kHz sampling rate
- * DB-15 connector for monitor
- * Composite connectors (RCA phono jacks) for composite video input
- * S-video input connector
- * Internal digital audio/video (DAV) connector for video compression/decompression cards

Video Input

=====

- * 24-bit video input
- * Real-time video playthrough of up to 640 by 480 pixels with NTSC; 768x576 pixels with PAL and SECAM
- * Up to 320x240-pixel capture up to 15 frames per second with NTSC
- * Maximum capture size of 640x480 pixels with NTSC

Audio System

- * Custom sound circuitry, including stereo generator (digital-to-analog converter, or DAC)—capable of driving stereo miniplug headphones or audio equipment—and stereo sampling hardware (analog-to-digital converter, or ADC) for recording stereo sound
- * 16-bit stereo input and output
- * Sample rates of 44.1 and 22.05 kilohertz (kHz)
- * Input line level: 2 volts peak-to-peak nominal, into 6.5-Kilohm (k) impedance
- * Output line level: 2.2 volts peak-to-peak nominal, into 1 k impedance
- * Input through output SNR**: >74 decibels (dB) typical
- * Bandwidth: 10 Hz-19 kHz (+/- 2 dB) at 44.100 kHz sample rate
- * THD+N**: Less than 0.06%; measured 30 Hz-16 kHz with a 2-Vpp sine wave input

**SNR is signal-to-noise ratio; THD+N is total harmonic distortion plus noise.

Graphics support

=====

- * 2 MB of VRAM, expandable to 4 MB
- * Fast 64-bit data path to VRAM
- * Support for display resolutions of up to 1,280x1,024 pixels
- * 24-bit color up to 1,152x870-pixel resolution
- * Refresh rate of up to 75 Hz

GeoPort telephony (Requires GeoPort Telecom Adapter)

=====

- * 14.4-Kbit/s modem support
- * V.17 fax support

- * GeoPort Fax and GeoPort Telephony software included
- * Speakerphone and answering-machine capability

Clock/calendar

=====

- * Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- * Supports ADB keyboards with numeric keypads
- * Comes with an ADB Mouse II

Electrical requirements and compliance

=====

- * Line voltage: 100 to 240 V AC, RMS single phase
- * Frequency: 50 to 60 Hz, single phase
- * Power: 150 W maximum, not including display

ADB power requirements

=====

- * Maximum current draw for all devices: 500 mA (a maximum of three ADB devices is recommended)
- * Mouse draws 10 mA
- * Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- * Height: 6.15 in. (15.6 cm)
- * Width: 14.37 in. (36.5 cm)
- * Depth: 16.93 in. (43.0 cm)
- * Weight: 22 lb. (9.97 kg)

Environmental requirements

=====

- * Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- * Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95% noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:

- 15 Oct 1996 - Added additional processor speed.
- 19 Sep 1996 - Updated processor card support speed.
- 17 Sep 1996 - Updated information.

Power Macintosh 8500/132 & 8500/150: Description (9/96)

Revised: 9/19/96
Security: Everyone

Power Macintosh 8500/132 & 8500/150: Description (9/96)

=====

Article Created: 1 April 1996
Article Reviewed/Updated: 19 September 1996

TOPIC -----

This article contains a description of the Power Macintosh 8500/132 and 8500/150 series computers.

IMPORTANT: Another article in the Tech Info Library title, "Power Macintosh 8500/150 & 8500/180: Description" contains information about the latest 8500/150 configuration.

DISCUSSION -----

If your profession demands a high-performance, expandable computer that can handle any media as easily as text, opt for a Power Macintosh 8500 series system. Depending on your current budget and need for power, you can choose the Power Macintosh 8500/132 or the 8500/150, which feature a 132- or a 150-megahertz PowerPC 604 RISC processor, respectively. Both high-performance systems make an ideal choice for in-house publishing, media authoring, and technical applications--and because they're processor upgradable, they protect your investment for the future.

Built-in near-broadcast-quality video-input/output capabilities, high-resolution graphics, and CD-quality stereo sound add vitality to professional projects and--with Apple's QuickTime software--make media authoring easy.

You can also customize these computers easily to more precisely meet your needs, through their three industry-standard Peripheral Component Interconnect (PCI) expansion slots. You can find many PCI cards for a variety of uses, including video compression, video production, and high-speed networking. And if you want to use your Power Macintosh 8500 series computer to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install an Apple PC Compatibility Card in one of the system's PCI slots--and switch instantly between the two computing environments.

Connecting your Power Macintosh 8500/132 or 8500/150 computer to an Ethernet network is easy, because it includes both AAUI and 10BASE-T connectors. With an optional PC Compatibility Card, you can connect both the card and Power Macintosh to a network simultaneously.

Today, more and more computer users are discovering the wealth of information and communications resources and opportunities offered by the Internet. Power Macintosh 8500 systems make it easy to get involved in this rapidly expanding community, because they come with all of the software you need for easy Internet access.

The Power Macintosh 8500/132 and 8500/150: exceptional performance for handling any media as easily as text to enhance your creativity.

Features

=====

High performance

- * 132- or 150-MHz PowerPC 604 processor, user-upgradable to a faster processor when available (up to 250 MHz)
- * Built-in floating-point processor and 32K cache
- * 256K level 2 cache
- * Built-in graphics acceleration

Communications and multimedia

- * 64-bit VRAM graphics subsystem
- * Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- * Quadruple-speed CD-ROM drive.
- * 16-bit stereo audio input and output
- * 24-bit composite and S-video input and output
- * Support for speech-recognition and text-to-speech capabilities
- * Optimized for QuickTime Conferencing software

Expandability

- * Three industry-standard PCI expansion slots
- * SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- * Internal expansion bay for additional hard disk drive

Compatibility

- * Includes 10BASE-T and AAUI Ethernet connectors
- * Supports Open Transport networking software (TCP/IP and AppleTalk)
- * Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- * Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- * Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- * Comes with all of the software required for Internet access

System 7.5 software

- * Makes working with different applications consistent, so they're easier to learn and use
- * Allows easy customization of your Macintosh to reflect the way you work
- * Provides active assistance in learning new features with Apple Guide

DISCUSSION -----

Upgradable microprocessor

=====

- PowerPC 604 microprocessor running at 132 MHz or 150 MHz, upgradable to a higher-speed processor when available (up to 250 MHz)
- Integrated floating-point unit, 32K cache, and three integer units
- High-speed system bus (up to 50 MHz)

Memory

=====

- 16 MB of RAM, expandable to 512 MB via 8 DIMM sockets
- 4 MB of ROM
- 256K level 2 cache

Disk drives

=====

- Internal 1.2 GB or 2 GB high-performance SCSI hard disk
- Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4 MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal quadruple-speed
- Expansion bay for additional 3.5-inch hard disk

Interfaces

=====

- Three PCI expansion slots compatible with PCI 2.0-compliant cards
- Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- Internal Fast SCSI bus (up to 10 MB/s)
- External SCSI bus (up to 5 MB/s)
- Apple Desktop Bus (ADB) expansion port
- RCA phono jacks for line-level stereo audio input and output
- Mini jacks for stereo audio input and output
- All sound ports support 16-bit audio and up to 44.1-kHz sampling rate
- DB-15 connector for monitor
- Composite connectors (RCA phono jacks) for composite video input and output
- S-video input and output connectors
- Internal digital audio/video (DAV) connector for video compression/decompression cards

Video input/output subsystem

=====

- 24-bit video input
 - Real-time video playthrough of up to 640x480 pixels with NTSC; 768x576 pixels with PAL and SECAM
 - Up to 320x240-pixel capture up to 25 frames per second with NTSC (with 2 GB drive)
 - Maximum capture size of 640x480 pixels with NTSC
- 24-bit video output
 - Support for NTSC and PAL
 - Convolution for flicker reduction at all bit depths

Graphics support

=====

- 2 MB of VRAM, expandable to 4 MB
- Fast 64-bit data path to VRAM
- Support for display resolutions of up to 1,280x1,024 pixels
- 24-bit color up to 1,152x870-pixel resolution
- Refresh rate of up to 75 Hz

GeoPort telephony (Requires GeoPort Telecom Adapter)

=====

- 14.4-Kbit/s modem support
- V.17 fax support
- GeoPort Fax and GeoPort Telephony software included
- Speakerphone and answering-machine capability

Clock/calendar

=====

- Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- Supports ADB keyboards with numeric keypads
- Comes with an ADB Mouse II

Electrical requirements and compliance

=====

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 225 W maximum, not including display

ADB power requirements

=====

- Maximum current draw for all devices: 500 mA
(a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- Height: 14 in. (35.6 cm)
- Width: 7.7 in. (19.6 cm)
- Depth: 15.75 in. (40.0 cm)
- Weight: 25 lb. (11.3 kg)

Environmental requirements

=====

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Power Macintosh 9500/150: Description (9/96)

Revised: 9/19/96
Security: Everyone

Power Macintosh 9500/150: Description (9/96)

=====

Article Created: 1 April 1996
Article Reviewed/Updated: 19 September 1996

TOPIC -----

This article contains a description of the Power Macintosh 9500/150 computer.

DISCUSSION -----

The Power Macintosh 9500/150 computer is the top of the line in speed, performance, expandability, and upgradability, which is tremendous news for publishers, engineers, and multi-media professionals. With a 150-megahertz PowerPC 604 processor, this system provides the power you need today--and because it's processor upgradable, it protects your investment while offering room to grow.

With six industry-standard Peripheral Component Interconnect (PCI) expansion slots, this is also the most customizable, expandable Macintosh computer ever. You can find many PCI cards for a variety of uses, such as videoconferencing, video production, and high-speed networking. And if you want to use your Power Macintosh 9500/150 to run MS-DOS and Windows applications as well as software written for the Macintosh, you can install an Apple PC Compatibility Card in one of the system's PCI slots--and switch instantly between the two computing environments.

With the accelerated graphics card installed--and most configurations include one--the Power Macintosh 9500/150 supports all Apple and most third-party displays, including monochrome, color, VGA, and SVGA displays. For example, you can use your system to view up to 16.7 million colors on Apple color displays of up to 17 inches, without any additional VRAM.*

Connecting your Power Macintosh 9500/150 computer to an Ethernet network is easy, because it includes both AAUI and 10BASE-T connectors. With an optional PC Compatibility Card, you can connect both the card and Power Macintosh to a network simultaneously.

..TIL19548-Power_Macintosh_9500-150-Description_9-96_(TA35259).pdf

Today, more and more computer users are discovering the wealth of information, communications resources, and opportunities offered by the Internet. The Power Macintosh 9500/150 makes it easy to get involved in this rapidly expanding community, because it comes with all of the software you need for easy Internet access.

So whether you're involved in publishing, engineering, or multi-media--or simply want the most powerful, expandable Macintosh computer ever--the Power Macintosh 9500/150 is designed to meet your needs.

Features

=====

High performance

- 150-MHz PowerPC 604 processor, user-upgradable to faster processor when available (up to 250 MHz)
- Built-in floating-point processor and 32K cache
- 512K level 2 cache

Communications and multimedia

- Two high-speed serial ports compatible with GeoPort and LocalTalk cables
- Quadruple-speed CD-ROM drive
- 16-bit stereo audio input and output
- Support for speech-recognition and text-to-speech capabilities

Expandability

- 16 MB or 32 MB of RAM expandable to 768 MB
- 2 MB of VRAM expandable to 4 MB
- Six industry-standard PCI expansion slots
- Dual-channel SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- Two open internal expansion bays for additional hard disk drives or other SCSI devices

Compatibility

- Includes 10BASE-T and AUI Ethernet connectors
- Supports Open Transport networking software (TCP/IP and AppleTalk)
- Runs 680x0 Macintosh applications as well as applications accelerated for Power Macintosh computers
- Reads Mac OS, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- Runs MS-DOS and Windows applications via optional PC Compatibility Cards
- Comes with all of the software required for Internet access

System 7.5 software

- Makes working with different applications consistent, so they're easier to learn and use
- Allows easy customization of your Macintosh to reflect the way you work
- Provides active assistance in learning new features with Apple Guide

Ordering Information

=====

Power Macintosh 9500/150

- Power Macintosh 9500/150 computer with 16 MB or 32 MB of RAM, a built-in 1.4 MB Apple SuperDrive floppy disk drive, an internal 2 GB hard disk drive, an internal quadruple-speed CD-ROM drive, and a PlainTalk microphone. Includes mouse; system software version 7.5.3 or later; Internet access software; complete setup, learning, and reference documentation; and limited warranty.

PC Compatibility Card Solutions

- Order No. M4092LL/A
 - PC Compatibility Card with Pentium 100-MHz processor
- Order No. M4091LL/A
 - PC Compatibility Card with 586 100-MHz processor

Power Macintosh GeoPort Telecom Adapter

- Order No. M3127LL/C

Apple QuickDraw 3D Accelerator Card

- Order No. M4333LL/A

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Power Macintosh 9500/150: Technical Specifications (9/96)

Article Created: 1 April 1996
Article Reviewed/Updated: 19 September 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 9500/150 computer.

DISCUSSION -----

Upgradable microprocessor

- PowerPC 604 microprocessor running at 150 MHz, upgradable to a higher-speed processor when available (up to 250 MHz)
- Integrated floating-point unit and 32K cache
- High-speed system bus (up to 50 MHz)

Memory

- 16 MB or 32 MB of RAM, expandable to 768 MB via 12 DIMM sockets
- 4 MB of ROM
- 512K level 2 cache

Disk drives

- Internal 2 GB high-performance SCSI hard disk
- Internal Apple SuperDrive floppy disk drive
 - Accepts high-density 1.4MB disks and 800K disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal AppleCD 600i quadruple-speed (4X) CD-ROM drive
- One open expansion bay for additional 3.5-inch hard disks

Interfaces

- Six PCI expansion slots compatible with PCI 2.0-compliant cards

- Two high-speed DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables
- 10BASE-T and AAUI-15 Ethernet connectors; optional PC Compatibility Cards provide multinode support for simultaneous network connections
- Internal Fast SCSI bus (up to 10 MB/s)
- External SCSI bus (up to 5 MB/s)
- Apple Desktop Bus (ADB) expansion port
- 16-bit stereo sound input and output ports
- DB-15 connector for monitor (on accelerated graphics card, if included)

Graphics support

=====

- 2 MB of VRAM, expandable to 4 MB
- Support for display resolutions of up to 1,280x1,024 pixels
- 24-bit color up to 1,152x870-pixel resolution
- Refresh rate of up to 75 Hz
- Third-party displays, including VGA and SVGA monitors

Clock/calendar

=====

- Custom integrated circuit with long-life battery

Keyboard and mouse

=====

- Supports ADB keyboards with numeric keypads
- Comes with an ADB Mouse II

Electrical requirements and compliance

=====

- Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 225 W maximum, not including display

ADB power requirements

=====

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard used)

Size and weight

=====

- Height: 16.9 in. (43.0 cm)
- Width: 7.7 in. (19.6 cm)
- Depth: 15.75 in. (40.0 cm)
- Weight: 28 lb. (12.7 kg)

Environmental requirements

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:

- 19 Sep 1996 - Updated processor card support.
- 18 Jul 1996 - Changed number of open bays to one.
- 19 Apr 1996 - Updated information.

Apple Color OneScanner 600/27: Terminator isn't required (4/96)

Revised: 4/17/96
Security: Everyone

Apple Color OneScanner 600/27: Terminator isn't required (4/96)

=====

Article Created: 1 April 1996
Article Reviewed/Updated: 17 April 1996

TOPIC -----

This article provides Questions and Answers about SCSI termination on the Apple Color OneScanner 600/27.

DISCUSSION -----

Question:
Is a SCSI terminator required on the Apple Color OneScanner 600/27?

Answer:
No. The Apple Color OneScanner 600/27 includes built-in SCSI termination, so external SCSI termination is not required. However, there is an option to turn SCSI termination off.

Question:
How do I set the SCSI ID and termination on the Color OneScanner 600/27?

Answer:
SCSI termination is determined by the SCSI ID Settings used. The default setting on the SCSI ID selector is 2-termination on.

Below is a rough diagram of the SCSI ID selector switch. This is located in between the two SCSI ports on the back of the Color OneScanner 600/27. The black numbers on the 0 side indicate that the termination is "OFF". The red numbers on the "1" side indicate that the termination is on.

Begin_Graphic

0 1

0

End_Graphic

There is a dial in the middle that you use to select the number and termination setting. Please make sure that the Scanner and computer are turned off when you change the setting.

Question:

If the termination is built in, how do I add another SCSI device to the SCSI chain?

Answer:

If the OneScanner is the only SCSI device, or the last device on the SCSI chain, set the termination to on. If the OneScanner is going to be used in the middle of the chain, the termination should be set to off, and a SCSI terminator should be used at the end of the SCSI chain.

IMPORTANT:

Do not assign numbers 0 or 7 to the OneScanner. The default SCSI address of the internal hard disk is 0, and the default SCSI address of the Macintosh computer is 7. If you have other SCSI devices, make sure you use a number that is not assigned to any other SCSI device. Each SCSI address must be unique. SCSI ID number 3 is reserved for internal CD drives.

Article Change History:

17 Apr 1996 - Added 0 and 1 to the diagram.

08 Apr 1996 - Added More detailed information on SCSI connector.

LaserWriters: Driver Availability for Windows NT 3.5.1 (3/97)

Revised: 4/21/97
Security: Everyone

LaserWriters: Driver Availability for Windows NT 3.5.1 (3/97)

=====

Article Created: 1 April 1996
Article Reviewed/Updated: 25 March 1997

TOPIC -----

Are there any Apple LaserWriter printer drivers available for Windows NT 3.51?

DISCUSSION -----

The drivers in the following list are included in Windows NT 3.51 and are supported by Microsoft.

LaserWriter
LaserWriter Plus
LaserWriter 16/600
LaserWriter Pro 600
LaserWriter Pro 630
LaserWriter Pro 810
LaserWriter Select 360
LaserWriter IINT
LaserWriter IINTX
LaserWriter IIIf
LaserWriter IIg
Personal LaserWriter NTR

Apple provides Windows NT printer drivers for the following LaserWriter printers:

Color LaserWriter 12/600 PS
Color LaserWriter 12/660 PS
LaserWriter 16/600 PS
LaserWriter 12/640 PS

For more information about driver availability with Windows NT 4.0, please refer to the Tech Info Library article titled, "LaserWriters: Driver Availability for

Windows NT 4.0."

Microsoft wrote the AppleTalk stack for Windows NT, and they support network printing to these printers (not Apple). If you are using Windows NT for network printing, you should be aware there are problems with the Windows NT AppleTalk stack prior to version 3.5. Apple does support parallel printing on Windows NT.

Article Change History:

25 Mar 1997 - Edited for technical accuracy.

24 Feb 1997 - Added Windows NT 4.0 information.

24 Jan 1997 - Added Color LW 12/660.

Windows LaserWriter v3.0.4 Driver: Wrong ReadMe file (4/96)

Revised: 4/1/96
Security: Everyone

Windows LaserWriter v3.0.4 Driver: Wrong ReadMe file (4/96)

=====

Article Created: 1 April 1996

TOPIC -----

I installed the LaserWriter Driver for Windows 3.1 v.3.0.4, and the Read Me file in the Apple LaserWriter Software program group is for Windows 95.

DISCUSSION -----

The installer incorrectly installs the Laserwriter for Windows 95 readme.txt onto your system. The correct ReadMe is found on the disk and within the archive, but the installer uses a hidden ReadMe file that could not be removed.

Please refer to the ReadMe file posted on the Apple Software Updates sections or the README.TXT file contained within the posted software.

PowerTalk 1.2.3 & Sys 7.5 Update 2.0: Install Questions (3/96)

Revised: 4/1/96
Security: Everyone

PowerTalk 1.2.3 & Sys 7.5 Update 2.0: Install Questions (3/96)

=====

Article Created: 1 April 1996

TOPIC -----

I have a few questions regarding PowerTalk 1.2.3 and System 7.5 Update 2.0.

1) Question: Are there any reasons for users not to use their old PowerTalk Setup Preferences with the old keychain information? Assuming these preference are not corrupted, is this an OK to do?

2) Question: Are there any issues with the MailLink PowerTalk gateways with System 7.5 Update 2.0 and PowerTalk 1.2.3?

3) Question: Will Direct Dialup be recognizable as a Custom Install option using the System 7.5 Update 2.0 CD-ROM disc PowerTalk Installer, or will it be part of the Easy Install? Also will it update Direct Dialup if present, and how will users add Direct Dialup if they haven't used it before?

DISCUSSION -----

1) Answer: If you are a current PowerTalk user, you should run System 7.5 Update 2.0 and then install PowerTalk 1.2.3. Although PowerTalk may be functional after the update but before installing PowerTalk 1.2.3, the tested and recommended configuration is to update to PowerTalk 1.2.3. This presents one small problem. The PowerTalk 1.2.3 software is posted online and is included on the System 7.5 Update 2.0 CD-ROM disc but it is not included as part of the floppy disk set. So if you download System 7.5 Update 2.0 you should also download PowerTalk 1.2.3.

This procedure will preserve all existing PowerTalk settings, aliases, passwords, and so on. You should not have to touch any of the preferences files.

2) Answer: The gateways were tested for compatibility with System 7.5 Update 2.0. They were tested extensively for the System 7.5.3 release.

3) Answer: Direct Dialup and the other gateways are all manually installed,

therefore the updates must also be manually installed. Each of the Direct Dialup or gateway installers can be used to install the software for the first time or update the existing one.

AppleDesign Powered Speakers: Adding a Subwoofer (4/96)

Revised: 4/1/96
Security: Everyone

AppleDesign Powered Speakers: Adding a Subwoofer (4/96)

=====

Article Created: 1 April 1996

TOPIC -----

Certain versions of the AppleDesign Powered Speakers have a jack on them for connecting a subwoofer. What are the requirements for connecting a subwoofer?

DISCUSSION -----

The subwoofer output on the AppleDesign Powered Speakers can reach levels of up to 2 Volts peak-to-peak. The subwoofer must handle an input signal that can reach this 2 Volt peak-to-peak level, or the subwoofer needs to have a input volume control.

Apple Computer does not recommend connecting a subwoofer that cannot handle the output levels from the subwoofer jack on the AppleDesign Powered Speakers. Check the manual that comes with the third-party subwoofer, or contact the manufacturer to see if the subwoofer can accept these levels.

If the Subwoofer has an input volume control you may be able to turn down the input signal that the subwoofer is receiving from the AppleDesign Powered Speakers. If this is attempted, start with the volume on the AppleDesign Powered Speakers turned all the way down and the input volume control on the subwoofer also turned all the way down. Slowly adjust the volume controls to a usable level. You may need to keep the subwoofer input volume control turned down while increasing the volume on the AppleDesign Powered Speakers.

Apple Telecom 2.3.3: Read Me File (11/96)

Revised: 12/20/96
Security: Everyone

Apple Telecom 2.3.3: Read Me File (11/96)

Article Created: 1 April 1996
Article Reviewed/Updated: 27 November 1996

TOPIC -----

This article is the Apple Telecom 2.3.3 ReadMe file found with the online software updates.

DISCUSSION -----

Name: Apple Telecom
Version: 2.3.3
Released: March 28, 1996
Description: This software replaces Apple Telecom 2.3.2. It is recommended for use with System 7.5.3. For complete information, please see below.

The software posted here consists of two self-extracting archives of Disk Copy 1440K disk images. To use, download, double-click the downloaded file (this decompresses it), and use Disk Copy to create the disks. Disk Copy can be found in the Utilities folder posted here.

Apple Telecom 2.3.3 consists of 2 disks:

Name as Posted	Actual Disk Name
Telecom 2.3.3-1of2.sea	Apple Telecom Disk 1
Telecom 2.3.3-2of2.sea	Fax Software

GeoPort Telecom Adapter ReadMe
=====

Software included in the GeoPort Telecom Adapter Kit

Apple Telecom Software

This includes all software necessary to use the GeoPort Telecom Adapter with the following Macintosh systems:

- Centris 660AV, Quadra 660AV and Quadra 840AV.
- Power Macintosh 6100 series, 7100 series, 7200 series, 7500/100, 8100 series, 8500/120, and 9500 series.

The Apple Telecom User's Guide contains complete information about installing and using this software. An electronic Apple Telecom Upgrade Manual is included in the Telecom Documents folder so that you can learn about the new features if you upgraded electronically and don't have the Apple Telecom User's Guide. Disks 1 and 2 can also be used to install Apple Telecom 2.x software on Macintosh systems equipped with an Express Modem card.

Note: For Power Macintosh 7200 series, 7500/100, 8500/120, and 9500 series, version 2.1 or higher of Apple Telecom Software is required. If you are using a GeoPort Telecom Adapter on these Power Macintosh models, you must disable LocalTalk. To do this, disconnect any LocalTalk devices attached to the printer port (serial devices can remain attached).

Important If you select "Sleep" from the Special Menu available on some Power Macintosh models while there is an active GeoPort connection, the GeoPort Telecom Adapter will automatically disconnect the call without warning. When a Power Macintosh 7200 series model is in the low-power mode, the GeoPort Telecom Adapter will wake up the machine if the telephone rings and the machine is awaiting an incoming call. The monitor will remain in the low-power mode. While a connection is open via a GeoPort Telecom Adapter, your Power Macintosh will not enter the low-power mode, but the monitor will dim the screen.

MegaPhone (for United States, Canada, and Japan only)

This is a screen-based telephone application that delivers full support of the telephony capabilities of the Apple Telecom 2.x software, including support for dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information, and voice-mail functions.

The GeoPort Telecom Adapter Kit also includes a free 30-day trial of call logging, MegaDial dialing manager, intelligent synchronization with directory information (saving telephone numbers to a PowerTalk catalog, for example), and other extended capabilities.

See also: the MegaPhone electronic manual included on Disk 3 (Telecom Applications).

Note: MegaPhone is not installed by the Apple Telecom Installer program. You must install it separately.

SITcomm SE/GTA (for United States and Canada only)

..TIL19556-Apple_Telecom_2-3-3-Read_Me_File_11-96_(TA35268).pdf

This is a terminal emulator application. With SITcomm SE/GTA (Special Edition for GeoPort Telecom Adapter), your Macintosh can communicate with a variety of other computers, linked by serial cables or by telephone lines.

With SITcomm you can exchange information with

- A colleague who is using another computer with similar communications software.
- Text-based information and electronic mail services, such as CompuServe or MCI Mail.
- Your company or school's remote minicomputer or mainframe.

See also: the SITcomm SE electronic manual included on Disk 4 (Telecom Applications).

Note: SITcomm is not installed by the Apple Telecom Installer program. You must install it separately.

Note: SITcomm (Disk 4) is not included with free upgrades. You can order the full upgrade, including SITcomm SE and the Apple Telecom User's Guide manual, by calling the Apple Order Center. Ask for the Apple Telecom software version 2.x upgrade for use with your GeoPort Telecom Adapter.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

Upgrading from Previous Releases of GeoPort Telecom Adapter Software

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

Note: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

When you have installed over an older version, the folders "Modem Documents" and "Express Fax" and the file "GeoPort ReadMe" may still be left on your hard disk from the earlier version. These are not necessary for using the newer version; you may delete them.

Connection (CCL) Scripts for Apple Remote Access

Use the following connection scripts with Apple Remote Access:

ARA 1.0: GeoPort Telecom ARA 1.x (in Extensions folder in System Folder)
ARA 2.0: GeoPort Telecom ARA 2.x (in Extensions folder in System Folder)

These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of

the Apple Telecom User's Guide. Apple Remote Access 1.0 does not support Power Macintosh computers. You can order an upgrade for Apple Remote Access by calling the Apple Order Center (in United States and Canada only).

Two additional, optional connection (CCL) files, named GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG, are installed as well. When you use them, the GeoPort Telecom Adapter transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter), you should select one of these connection files in the Apple Remote Access Setup control panel.

Note: The GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Remote Access Dial Back

If your Remote Access server uses a "Dial Back" feature, the server's return call back to your machine may be inadvertently directed to an open telephone application. To avoid this situation, either close these applications or open the Express Modem control panel and choose "Data" as the default call type when you expect an incoming call from another computer.

Using Fax Sender GX with QuickDraw GX 1.1

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex grayscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

Note: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk Network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

Note: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

Note: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

See also: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript printers.

Troubleshooting

Connecting to online services that do not support data compression or error correction

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the GeoPort Telecom Adapter to drop the

connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

Communication Settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying Incoming Calls

When answering your phone line, the GeoPort Telecom Adapter will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application (such as MegaPhone), we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

If you have problems receiving calls from data modems (when using the Apple Remote Access dial back feature, for example), try decreasing the number of rings to Auto-answer in the Express Modem control panel (if permitted in your country). Some calling modems may time out and disconnect before your modem answers if the number of rings is too high.

Removing Fax Storage Folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Using a Centris 660AV or Quadra 660AV/840AV

If you are using a Centris 660AV or Quadra 660AV/840AV and experience errors when attempting to establish a connection, you may need to change the audio settings on your computer. The default setting of 24.000 kHz is compatible with

the GeoPort Telecom Adapter. To change this setting, open the sound control panel, choose "Sound Out" and select the "24.000 kHz" sampling rate.

Resetting a Blacklisting Error Message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

Clicking Sound from GeoPort Telecom Adapter

If your machine freezes, the GeoPort Telecom Adapter can lose its connection with your machine and may generate a rapid clicking sound. This sound is a temporary side-effect of the lost connection. To stop the clicking, unplug the adapter for a few seconds or restart your machine.

Port Selection

The interface for selecting the correct communications port has been simplified since GeoPort Telecom Adapter software versions 1.0.2 (Power Macintosh) and 1.2.2 (660AV/840AV). The "Use internal modem instead of modem port" checkbox has been removed from the Express Modem Control Panel. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. If so, all serial communications are first processed by the Express Modem software and transmitted through the GeoPort Telecom Adapter. If not, serial communication passes through the modem port directly.

GeoPort has been removed from the list of ports. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. Select Modem Port whenever you wish to communicate through the GeoPort Telecom Adapter.

What Goes Where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- GeoPort Telecom Adapter ReadMe
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)

- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (OCR manual for users who upgrade electronically)
- About Apple Fax Gateway (Gateway manual for users who upgrade electronically)
- About Fax Sender GX (Fax Sender GX manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- GeoPort Telecom ARA 1.x/CNG (optional, transmits data calling tone, 660/840AV only)
- GeoPort Telecom ARA 2.x/CNG (optional, transmits data calling tone)
- Modem AT Command Set

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- AudioTuneUp (9500 series only)
- Express Modem Tool
- Fax Extension
- Fax Sender
- Fax Sender GX
- GeoPort for Power Macintosh (Power Macintosh only)
- GeoPort Extension (660/840AV only)
- GeoPort Serial Driver
- GeoPort Telecom Adapter
- GeoPort Telephone Tool
- GeoPort Telecom ARA 1.x (Apple Remote Access 1.0 CCL, 660/840AV only)
- GeoPort Telecom ARA 2.x (Apple Remote Access 2.0 CCL)
- Serial Extension (660/840AV and 6100/7100/8100 series only)
- Shared Library Manager
- Telephone Manager Extension

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)
- Electronic Telephone (sound resource)

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center phone number.

This article is one of many available through the Apple Fax center. For a

complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Apple Media Tool 2.0: Use 256 Colors for Windows Compile (4/96)

Revised: 4/1/96
Security: Everyone

Apple Media Tool 2.0: Use 256 Colors for Windows Compile (4/96)

=====

Article Created: 1 April 1996

TOPIC -----

I am trying to run a compiled Apple Media Tool (AMT) 2.0 program on the Power Macintosh 6100/DOS Compatible computer. The project runs fine under the Mac OS, however the Windows version of the compile, which plays fine on a Windows computer, quits with the following error:

"The display device does not support 640x480 pixels and 65536 colorsor 0 colorsor 256 colors!

Please re-set the device and restart Windows."

The project is set to default to 256 colors if thousands of colors cannot be accomplished. This is done through the runtime setup menu.

DISCUSSION -----

When you set your preference options for AMT, you must set the color depth to 256 colors as the first option. You must also make sure the the driver is set to 256 colors on the 6100/DOS compatible. It cannot be set for 16 colors and it will not do any thing above 256 colors, so 256 is your only option.

System 7.5.3: Load QuickTime Before GXGraphics (2/97)

Revised: 2/24/97
Security: Everyone

System 7.5.3: Load QuickTime Before GXGraphics (2/97)

=====

Article Created: 2 April 1996
Article Reviewed/Updated: 24 February 1997

TOPIC -----

I installed the System 7.5 Update 2.0 and QuickDraw GX 1.1.3 with the GXGraphics (Debug) * extension. During the Startup process, GXGraphics (Debug) extension loads, then QuickTime freezes. Macsbug reports an unimplemented ATrap called by QuickTime. What is going on?

* Note:
The QuickDraw GXGraphics (Debug) extension is part of the developer software development kit (SDK), not part of the standard QuickDraw GX software.

DISCUSSION -----

Apple is aware of this issue with QuickDraw GX v1.1.3 software. It will be fixed in future versions of the software. In the meantime there is a workaround you can use.

Workaround
=====

- Change the init loading order. Make QuickTime load prior to the GXGraphics extension.

AppleShare File Server & Sys 7.5 Update 2.0 Compatible (1/97)

Revised: 1/29/97
Security: Everyone

AppleShare File Server & Sys 7.5 Update 2.0 Compatible (1/97)

Article Created: 2 April 1996
Article Reviewed/Updated: 29 January 1997

TOPIC -----

This article provides compatibility, installation, and post installation troubleshooting for AppleShare File Server and System 7.5 Update 2.0.

DISCUSSION -----

Workgroup Servers and 7.5.3 Compatibility

NuBus-based Workgroup Server 60, 80, 6150, 8150, and 9150 customers can upgrade to System 7.5.3 by installing the System 7.5 Update 2.0. The Workgroup Server 95 is based on A/UX, and the System 7.5 Update 2.0 is not to be use with this operating system.

IMPORTANT: Please read and follow the instructions that are provided in the Software 7.5.3 Installing This Update read me file. In particular, start up the Macintosh or Workgroup Server with the System 7.5.x only chosen in the sets pop-up menu of the Extensions Manager control panel, before installing the System 7.5 Update 2.0

As a precaution, Apple recommends performing a backup of the server before undergoing a System Software upgrade.

In addition, Apple recommends customers upgrade to the latest version of AppleShare File Server software appropriate for their server:

- Workgroup Servers 60 and 80 or 680x0-based Macintosh computer with AppleShare 4.0.x -- AppleShare 4.0 users MUST upgrade to AppleShare 4.0.1 (this is not just a recommendation, it is requirement). The AppleShare Tune-Up 4.0.1 is available on Apple's online services. AppleShare 4.0.1 is functionally equivalent to the 680x0 version of AppleShare 4.0.2.

- Workgroup Servers 6150, 8150, 9150, or PowerPC-based Macintosh computer with AppleShare 4.x -- AppleShare 4.2.1 is the current version.

IMPORTANT: Please refer to Tech Info Library article "AppleShare 4.2.1: Questions and Answers", article ID: TECHINFO-0018744, for more information on compatibility of AppleShare and Open Transport.

Install System 7.5 Update 2.0 on computers with AppleShare File Server

=====

- Boot or start up the Macintosh or Workgroup Server from a bootable Disk Tools Disk or CD-ROM disc. (To start up from a CD-ROM on most Macintosh computers, you will need to press and hold the C key while the CD-ROM disc is in the CD-ROM drive.) You can ensure that a floppy or CD-ROM disc is the start up volume by looking for its icon in the upper-right most position on the desktop.
- Use Disk First Aid to verify and, if necessary, repair all of the volumes. Disk First Aid should be run from the Disk Tools Disk, or from the CD-ROM disc (usually located in the Utilities folder).
- Restart the Macintosh or Workgroup Server, and eject any CD-ROM disc, so the server will start up from the hard disk. Press and hold the space bar as soon as the Mac OS screen appears. Continue to hold the space bar until the Extensions Manager window displays. If you miss this opportunity, restart the computer and try the procedure again.
- Choose System 7.5.x only from the Sets pop-up menu in the Extensions Manager control panel window.

If you have third-party peripherals that are required for installation and require an extension, turn those extensions back on by placing a check mark to the left of the extension. For example, include video drivers, alternative input devices, network card drivers, and removable media. Do not select any other extensions, including the extensions required by AppleShare File Server.

- Click the Extensions Manager window's close box to continue with the startup process.
- Insert the System 7.5 Update 2.0 CD-ROM or the first floppy disk. If you are performing a network install, mount any necessary server.
- Double-click the Installer icon to launch the System 7.5 Update 2.0 installer.
- When you see the Installer's welcome screen, click Continue.
- The Easy Install dialog box appears. Easy Install automatically installs the files that your particular model of computer needs. Make sure the destination disk indicated on the screen is the one you want to install the update on. If it is not, click Switch Disk until the right destination disk appears.
- Click Install. Follow the instructions on the screen.

- When the installation is complete, click Restart to restart your computer.

Press and hold the space bar as soon as the Mac OS screen appears, and continue to hold the space bar until the Extensions Manager window appears. If you miss this opportunity, restart the computer and try the procedure again.

Use the Extensions Manager to turn on the File Server Extension, and, if present, the Desktop Manager Fix and Installer Cleanup extensions.

- When you have verified that the server is operational with the System 7.5 Update 2.0 installed, you may use the Extensions Manager control panel to select any third-party extensions and control panels, you may have been previously using, to run after restarting the computer. Contact the third-party software vendors if these extensions appear to cause additional issues.

Problems After The Install

=====

It is important that the instructions provided in the System 7.5 Update 2.0 Installing This Update file are followed without exception. If you did not follow these instructions, or followed them but encountered problems afterwards, you may have to perform a clean System Software installation, re-apply the System 7.5 Update 2.0, and reinstall AppleShare File Server.

The instructions below will help you reinstall software. Please read all the instructions through before proceeding.

Check Volumes with Disk First Aid

- Start up the Macintosh or Workgroup Server from a bootable Disk Tools Disk or CD-ROM disc. (To start up from a CD-ROM on most Macintosh computers, you will need to press and hold the C key while the CD-ROM disc is in the CD-ROM drive.) You can ensure that a floppy or CD-ROM disc is the start up volume by looking for its icon in the upper-right most position on the desktop.
- Use Disk First Aid to verify and, if necessary, repair all of the volumes. Disk First Aid should be run from the Disk Tools Disk, or from the CD-ROM disc (usually located in the Utilities folder).

Clean Install of System 7.5.x Software

- If you are using the Disk Tools floppy disk for Disk First Aid, restart the computer and insert the first System Software Install floppy disk, and you will start up directly to the Installer. If you are using a CD-ROM disc for Disk First Aid, you will need to locate and launch the System Software Installer application.
- Click Continue at the Welcome screen.
- Press the Command, Shift, and K keys simultaneously until a dialog box appears with these options, Update Existing System Folder or Install New System Folder.

- Select Install New System Folder and click the OK.
- Click Clean Install on the Installer window.
- When the installation finishes, quit the Installer, restart the server and immediately eject the CD-ROM disc, if present.

Install System 7.5 Update 2.0

NOTE: If using AppleShare 4.0 with the 4.0.1 patch, Apple recommends you install System 7.5 Update 2.0 first, then install AppleShare 4.0 and the 4.0.1 patch (see instructions below).

- Insert the System 7.5 Update 2.0 CD-ROM disc or the first floppy disk. If you are performing a network install, mount any necessary server.
- Double-click the Installer icon to launch the System 7.5 Update 2.0 installer.
- When you see the Installer's welcome screen, click Continue.
- The Easy Install dialog box appears. Easy Install automatically installs the files that your particular computer needs. Make sure that the destination disk indicated on the screen is the one you want to install the update on. If it is not, click Switch Disk until the right destination disk appears.
- Click Install. Follow the instructions on the screen.
- When the installation is complete, click Restart to restart your computer.

Reinstall AppleShare

-
- Insert the AppleShare CD-ROM disc or Install floppy disk, run the AppleShare Installer, and select Easy Install.

IMPORTANT: If you installing AppleShare 4.0, perform a Custom Install and omit the Shared Library Manager. To do this, dismiss a dialog box that appears when you first launch the installer which explains that the version to be installed is not compatible with currently-running version of the Shared Library Manager.

- When the AppleShare installation finishes, let the Macintosh computer start up normally.
- If using AppleShare 4.0, install the 4.0.1 patch at this point.
- Restart.

Retaining Users & Groups and Privileges

These next steps are important in order to retain the users and groups information and privileges on the server. These steps MUST BE FOLLOWED before launching the AppleShare Admin, or the AppleShare File Server software.

- Open the Preferences folder in the System Folder. Drag the existing Users & Groups Data File to the trash.
- Drag the original Users & Groups data file from the Preferences folder in the Previous System Folder to the Preferences folder in the System Folder.
- Restart the server. Do not skip this step.
- Open the Sharing Setup control panel and enter a name for the server in the Macintosh Name field. (This name will appear in the Chooser on client computers. To avoid confusion, you can choose the name the server had before reinstalling software, however, it is not critical that you do so.)
- To confirm that the file server is functioning properly, launch the AppleShare Admin program and verify the users & groups information. Then launch the AppleShare File Server, and logon to the server from a client to verify that access privileges are properly set.

If you use third-party extensions on the server, you may use the Extensions Manager control panel to select any third-party extensions and control panels to run at start up, but do so with caution. Contact third-party vendors if these extensions appear to cause issues on the server.

Power Macintosh 5400/120: Technical Specifications (7/96)

Revised: 7/12/96
Security: Everyone

Power Macintosh 5400/120: Technical Specifications (7/96)

Article Created: 2 April 1996
Article Reviewed/Updated: 12 July 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 5400 series computers.

DISCUSSION -----

Microprocessor

=====

- PowerPC 603e processor
- 120 MHz processor clock
- 32K internal cache
- Built-in floating point unit (FPU)
- 40 MHz system bus
- 64-bit memory bus
- 32-bit PCI bus
- Optional High Performance Module (256K level 2 cache)

Memory

=====

- 8 MB of dynamic random-access memory (DRAM) soldered to the main logic board, expandable to 136 MB using 168-pin JEDEC-standard DIMM devices.
- Two DIMM slots are provided for DRAM expansion.
- 1 MB of built-in video RAM
- 4 MB of read-only memory (ROM)
- 8K of nonvolatile parameter memory
- One socket for an optional 256K Level 2 cache DIMM card

Internal disk drives

=====

- Apple SuperDrive 1.4 MB high-density floppy disk drive
- Apple (Integrated Device Electronics) IDE hard disk drive
- Internal quadruple- or 8x-speed CD-ROM drive, depending on configuration.

Display

=====

- 15-in RGB color display (12.8-in diagonal viewable image size)
- 0.28-mm dot pitch
- Noninterlaced, flat, square cathode-ray tube (CRT)
- User-adjustable resolutions from 640 by 480 pixels to 832 by 624 pixels
- Resolution can be changed without restarting the computer
- Refresh rate up to 75 Hz
- Meets SWEDAC MPR2 international guidelines for magnetic-field emissions

Video

=====

Begin_Table

Graphics modes supported

Resolution	Colors	Scan frequencies
=====	=====	=====
640 x 480	16-bit	60 Hz and 67 Hz
800 x 600	16-bit	60 Hz
800 x 600	8-bit	72 Hz
832 x 624	8-bit	75 Hz

End_Graphic

Video output

With the optional external video connector kit, your Power Macintosh 5400 Series can be connected to a video presentation system or support video mirroring (connecting a second monitor for display purposes) at 640 x 480 resolution on the following monitors:

- Macintosh 12" Color Display
- Macintosh 13" Color Display
- Apple Color Plus 14" Display
- Macintosh Color Display
- Apple Multiple Scan 14 Display
- Apple Multiple Scan 15 Display
- Apple Multiple Scan 17 Display
- Apple Multiple Scan 20 Display
- VGA monitors (a plug adapter may be required)

You can use the following monitors for video mirroring at 800 x 600 and 832 x 624 resolutions:

- Apple SVGA displays
- Apple Multiple Scan 14 Display
- Apple Multiple Scan 15 Display
- Apple Multiple Scan 17 Display
- Apple Multiple Scan 20 Display

Video input

With the optional video input card, your Power Macintosh 5400 Series can connect to a video camera, VCR, or other video equipment.

- Format: composite or S-video
- Transmission Format: industry standard NTSC/PAL/SECAM
- Polarity: sync negative
- Level: .8 Vpp minimum to 2.0 peak-to-peak (p-p) maximum ("S" chroma level 1.4 Vpp maximum)
- Impedance: 75 ohms () internally terminated
- DC offset: +/- 1.0 volts (V) maximum
- 32-bit video data bus

Sound

=====

- 16-bit stereo input and output featuring SRS surround sound
- Sample rates of 11.025, 22.05 and 44.1 kilohertz (kHz)
- Sound input connector line level: 2 volts peak-to-peak (Vpp) nominal, into 10-kilohms (k) impedance (minimum)
- Sound output connector line level: 2 Vpp nominal, into 32- impedance
- Sound input signal-to-noise ratio (SNR): >70 decibels (dB)
- Sound output SNR: >70 dB (SRS disabled)

Clock/calendar

=====

- CMOS custom circuitry with long-life battery

Keyboard

=====

- Supports all Apple Desktop Bus (ADB) keyboards

Mouse

=====

- Supports all models of the ADB mouse

Interfaces

=====

- One Apple Desktop Bus (ADB) port supporting up to three ADB input devices (such as a trackball, keyboard, or mouse) daisy-chained through a synchronous serial bus.
- Optional monitor port supporting the connection of color and grayscale monitors of various sizes and resolutions for video mirroring.
- One internal expansion slot supporting 6.88-inch 15 watt Peripheral Component Interconnect (PCI) expansion cards.
- One internal expansion slot supporting communications cards (i.e. modem, fax, high speed networking).
- One internal expansion slot supporting video input cards using NTSC.
- Two RS-232/RS-422 serial GeoPort-compatible ports,
- One 3.5 mm sound output port for headphones or line-level devices.
- One 3.5 mm sound input port for stereo sound input. The sound input port supports the Apple PlainTalk Microphone that comes with some Macintosh computers.
- One external standard SCSI interface that supports up to 6 external SCSI devices.

Additional features

=====

- Built-in microphone
- Built-in stereo speakers
- Support for optional infrared remote control
- Front panel push-button controls for volume and picture
- Power on and off from keyboard and optional remote control (included with the optional TV tuner card)

Size and weight

=====

Weight: 47 lbs. (21.15 kg) Varies depending on installed options.

Height: 17.5 in. (445 mm)

Width: 15.1 in. (383 mm)

Depth: 16 in. (406 mm)

Environment

=====

- Operating temperature: 10° C to 40° C (50° F to 104° F)
- Storage temperature: -40° C to 47° C (-40° F to 116.6° F)
- Relative humidity: 5% to 95% (noncondensing)
- Altitude: Works below 3048 m (10,000 ft.)

Power

=====

AC line input

- Line voltage: 90-264 V alternating current (AC), RMS single phase, automatically configured.
- Frequency: 47-63 Hz
- Power: 220 watts maximum continuous

DC power

- Continuous output: 73 watts

Apple Desktop Bus (ADB)

- Mouse draws up to 10 milliamperes (mA)
- Keyboard draws 25-80 mA (varies with keyboard model used)
- Maximum current available for all ADB devices and all serial devices: 500 mA
- The ADB port can support up to three daisy-chained ADB devices.

Power Allowances for External Devices

=====

The following table shows power allowances for external devices connected to input ports:

Device	Voltage	Current	Power
-----	-----	-----	-----
Microphone	+5 V	1 mA	5 mW
GeoPort telecom adapter & ADB devices	+5 V	500 mA	2.5 W
S-video input connector	+12 V	250 mA	3 W

Power Allowances for Expansion Cards

=====

The following table shows power allowances for installed expansion cards.

Device	Voltage	Current	Power
-----	-----	-----	-----
PCI expansion card (15 watts)*	+3.3 V	2 A	6.6 W
	+5 V	3 A	15 W
	-12 V	500 mA	6 W
Communications expansion card**	+5 V	500 mA	2.5 W
	+12 V	100 mA	1.2 W
Video expansion card***	+5 V	200 mA	1 W
	+12 V	300 mA	3.6 W

Notes:

*The PCI expansion card should not consume more than 15 watts of power total.

**The communications card should not consume more than 2.5 watts of power total.

***The video input card should not consume more than 4.6 watts of power total.

Apple Telecom Won't install After Clean System Install (4/96)

Revised: 4/3/96
Security: Everyone

Apple Telecom Won't install After Clean System Install (4/96)

=====

Article Created: 3 April 1996

TOPIC -----

When I try to install the Apple Telecom software (from either the Apple Extras folder, or the disks that came with my GeoPort) after performing a clean system software installation on my Power Macintosh 8500/120 computer, I get an error message indicating the installation could not be completed. I have reset PRAM which did not help. I have also tried starting up from either the hard disk, or the CD-ROM -- this made no difference. What do I need to do to install Apple Telecom software.

DISCUSSION -----

These are the known cases where Apple Telecom software will not install.

- All Extensions off
- A minimal or reduced System Software
- When started from a CD-ROM disc

The Apple Telecom software should install properly after you install System Software with the Easy Install option to get the full system software on your hard disk. Also, you need to start the computer with all Apple extensions turned on.

Testing we have done while started from a CD-ROM disc or by dragging the minimal System Software from a CD-ROM disc to your hard disk does not work.

CLW 12/600 PS: Photoconductor LEDs Coming on Prematurely (10/96)

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS: Photoconductor LEDs Coming on Prematurely (10/96)

Article Created: 3 April 1996

TOPIC -----

My Color LaserWriter 12/600 PS will not print and there are several LEDs (lights) lit up on the status panel. The photoconductor has approximately 4,000 pages printed on it and the photoconductor LED is on. Is the printer supposed to shut down when the photoconductor LED turns on?

DISCUSSION -----

The photoconductor alert LED is an indicator that it is time to consider ordering a replacement photoconductor. The actual life of the photoconductor varies greatly depending on the type of printing being done. A worn out photoconductor begins to impact print quality, however it should not shut down the printer.

If the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS printer is shutting down, check for other error LEDs and consult the user's guide for recommendations. In some cases the waste toner LED may blink which indicating that the waste toner bottle is full. Every new photoconductor comes with two waste toner bottles because at least one of them is expected to fill up and require replacing during the life of the photoconductor.

Remove the waste toner bottle to see if it is full. Also inspect the clear plastic cap on the waste toner bottle to make sure that it is not contaminated with toner that might be blocking the photosensor light beam. Toner contamination can trigger a waste toner alert, when the waste toner bottle is not full.

Article Change History:

23 Oct 1996 - Added Color LaserWriter 12/660 PS to the discussion.

LaserWriter: TCP/IP Printing For VMS Solutions (4/96)

Revised: 4/4/96
Security: Everyone

LaserWriter: TCP/IP Printing For VMS Solutions (4/96)

=====

Article Created: 4 April 1996

TOPIC -----

This article provides information on a VMS software packages which supports UNIX style LPR printing. Apple customers with VMS systems and Apple LaserWriters may use this software as a solution for TCP/IP printing.

DISCUSSION -----

TGV Software's MultiNet for OpenVMS version 3.5 contains "LPD/LPR printing services" as part of its standard feature set.

There may be other third-party products which provide this functionality. This product is not tested by Apple, and therefore, not supported by Apple Computer.

For more information on configuring non-UNIX software for TCP/IP printing, see the Tech Information Library article, "LaserWriters: TCP/IP Printing from Non-UNIX Workstation."

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

PB 190,5300,2300: Sad Mac Error After Installing At Ease (1/97)

Revised: 1/17/97
Security: Everyone

PB 190,5300,2300: Sad Mac Error After Installing At Ease (1/97)

=====

Article Created: 4 April 1996
Article Reviewed/Updated: 17 January 1997

TOPIC -----

We encountered a problem with a PowerBook 190 and At Ease for Workgroups v3.0.1. Our new PowerBook 190 came with System 7.5.2, so I installed the System 7.5 Update 2.0 (7.5.3). No problem. Then after installing At Ease software, and restarting, we were greeted with the Sad Mac icon, and the error code: 0000000F 00000001. We were unable to startup from a Disk Tools floppy disk.

DISCUSSION -----

Issue
=====

The issue you describe may appear if you are using At Ease for Workgroups 3.0 or 3.0.1 and the following conditions are true:

- * the At Ease administrator has set the "Lock startup volume" option,
- * the Macintosh running At Ease is equipped with an IDE internal hard drive and a recent version of the driver software. (This includes the PowerBook 190, PowerBook 2300, and PowerBook 5300 series computers.) It should be noted that this issue has nothing to do with installing the System 7.5 Update 2.0.

In these circumstances, turning on the computer and attempting to startup from the internal hard disk will cause a "Sad Mac" window to appear. You will not be able to get to the At Ease logon screen or to the Finder.

The Solution
=====

The At Ease-IDE Utility 1.0 fixes this issue. Follow these steps to correct it:

1. Insert a bootable floppy disk that contains the At Ease-IDE Utility and do a restart while holding down simultaneously the Command-Shift-Option-Delete keys. It will take some time before the Finder appears. (See instructions at the end of this document for obtaining such a disk if you don't have one. It is also possible to connect a bootable external hard drive containing the At Ease-IDE Utility and, in the same manner, start up from that drive.)
2. If you see a dialog asking if you want to rebuild the desktop, click on cancel.
3. Once you have booted and are in the Finder, run the At Ease-IDE Utility. (Note that your internal hard disk will not be visible on the desktop.)
4. Choose "Restart" from the Special Menu in the Finder and allow the floppy disk to be ejected so that you are booting from the internal hard disk.
5. If At Ease is on, you will go to the At Ease logon screen as usual. (Note that if your computer's startup disk has been locked by At Ease for Workgroups, it will still be locked after running the At Ease-IDE Utility.)
6. If At Ease is off, you will go to the Finder.
7. Immediately upgrade to At Ease for Workgroups version 3.0.2 or later. (See below for information on obtaining version 3.0.2).

The data on your internal hard disk will not be affected by this problem or by running the At Ease-IDE utility.

On At Ease for Workgroups 2.x versions, IDE (ATA) drive locking was not supported, so the problem will not appear. You should still consider upgrading to At Ease 3.0.2 or subsequent versions.

Obtaining A Bootable Floppy Disk With The At Ease-IDE Utility =====

1. If you have a Disk Tools disk for the computer with the problem, you can move the At Ease-IDE Utility to that disk -- there should be room -- and then startup from that disk.
2. If you have access to any of the following on-line services, you can download a bootable disk image called "At Ease-IDE Utility Disk" on the following online services and Internet sites:
 - * America Online - keyword: applecomputer
 - * CompuServe - GO APLSUP
 - * Internet -
 - Worldwide Web: <<http://www.info.apple.com/swupdates>>
 - ftp: <<ftp://ftp.info.apple.com>>
3. If you do not have on-line access, you can obtain the At Ease-IDE Utility by

calling 800-SOS-APPL, or 800-767-2775. (Available in the US only.)

Obtaining At Ease For Workgroups 3.0.2 Update

=====

You can obtain the At Ease for Workgroups 3.0.2 update from any of the above on-line services using the same path.

Article Change History:

17 Jan 1997 - Updated Online references.

18 Jun 1996 - Added information about solution.

LaserWriter Select 310: PCI-Based Power Macintosh Issues (4/97)

Revised: 4/28/97
Security: Everyone

LaserWriter Select 310: PCI-Based Power Macintosh Issues (4/97)

=====

Article Created: 5 April 1996
Article Reviewed/Updated: 28 April 1997

TOPIC -----

This article contains solutions for customers using the LaserWriter Select 310 printer on PCI-Based Power Macintosh computers.

DISCUSSION -----

There are several issues which customers using Power Macintosh 7200/75, 7200/90, 7500/100, 8500/110, 9500/120, and 9500/132 computers with a LaserWriter Select 310 printer may experience.

These issues can range from longer print times to complete inability to print.

Known Issues

- Long delays (15 seconds to 15-30 minutes) before printing begins, pauses in printing, longer than expected print times
- Intermittent connection failures, that go away with with "try again" button in Print Monitor or "LaserWriter is unable print or the printer may have been disconnected, please check to make sure the printer is properly connected and turned on" if you background printing is off.
- No connection established, even after standard troubleshooting (includes clean install, v 7.0.1 of driver, and AppleTalk off).
- Problems printing when connected to service provider or online vendor (AOL) using modem port.

Customers should check the version of LaserWriter Select 310 driver. If you do not have version 7.0.1, you should upgrade. The driver is available in several software releases, including:

- System 7.5
- LaserWriter Select 310 (1.0.1) These disks would have come with your printer, and has version 1.0.1 on the back of the label.
- Apple Software Updates.

Customers also need to load the SerialDMA 2.0.2 driver. This file addresses problems with the serial architecture. Serial DMA is found in:

- SerialDMA 2.0.2
- Printing Fix 1.1
- System 7.5 Update 2.0
- System 7.5.3

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article was published in the Information Alley on 5 April 1996.

Article Change History:

Open Transport 1.0.8: AppleTalk Activated By Applications (4/96)

Revised: 4/8/96
Security: Everyone

Open Transport 1.0.8: AppleTalk Activated By Applications (4/96)

=====

Article Created: 8 April 1996

TOPIC -----

I have Open Transport version 1.0.8 installed on my Power Macintosh 7200 and when I try to print to my LaserWriter Select 310 printer I get a -97 error (port in use). I restarted, then reset the Parameter RAM (PRAM), and now I get -43 error (file not found). I went into the chooser and AppleTalk was active. I made AppleTalk inactive and restarted. I could print from SimpleText, but not from Quark Xpress. When I tried to print from Quark Xpress I received the -97 error again.

DISCUSSION -----

Open Transport v1.0.8 activates AppleTalk, which causes the -97 error. This issue is addressed in Open Transport v1.1. The System 7.5 Update 2.0 should solve this problem. There are several applications which O.T. 1.0.8 activates AppleTalk including MegaPhone, PageMaker, and Quark Xpress. However, there may be other applications this also occurs with.

Solution

=====

Use the System 7.5 Update 2.0 software to update your version of Open Transport to v1.1.

System 7.5.3: Compatibility Issue With Radius SoftPivot (4/96)

Revised: 4/8/96
Security: Everyone

System 7.5.3: Compatibility Issue With Radius SoftPivot (4/96)

=====

Article Created: 8 April 1996

TOPIC -----

I am using a Radius SoftPivot display on a Power Macintosh 7100. After I installed System 7.5 Update 2.0, the display software did not work correctly. The screen redraws only around the mouse pointer. The same behavior happened on my Macintosh IIsi with a SoftPivot display after installing System 7.5 Update 2.0.

DISCUSSION -----

There is an incompatibility problem with the SoftPivot 3.2.1 control panel and System 7.5 Update 2.0. Radius Technical Support is aware of the problem and are looking into the incompatibility issues. The only workaround is to disable the SoftPivot 3.2.1 control panel when using System 7.5 Update 2.0 (System 7.5.3).

This article appeared in the 8 April 1996 issue of Information Alley.

System 7.5.3: incompatible with some SuperMac NuBus cards (4/96)

Revised: 4/8/96
Security: Everyone

System 7.5.3: incompatible with some SuperMac NuBus cards (4/96)

=====

Article Created: 8 April 1996

TOPIC -----

I have a Quadra 950 with a SuperMac NuBus video card, and ever since I updated to System 7.5 Update 2.0 (System 7.5.3), I can no longer startup in 32-bit mode. Why?

DISCUSSION -----

There seems to be some incompatibilities in some of the older SuperMac NuBus cards and System 7.5.3. Contact Radius, which owns SuperMac, for information on workarounds and solutions.

PlainTalk 1.4 and Voice Options (4/96)

Revised: 4/8/96
Security: Everyone

PlainTalk 1.4 and Voice Options (4/96)

=====

Article Created: 8 April 1996

TOPIC -----

With PlainTalk 1.4, the Text-to-Speech and Speech Recognition portions are separate installations and can lead to the following scenarios:

1) When I'm in a speech-capable application like SimpleText and choose Speak All from the Sound menu, I get the following message: "An error occurred when SimpleText tried to speak." Additionally, in the Speech control panel, I have the Voice option, but once selected I'm not able to choose a voice in the pop-up menu.

2) I have just installed PlainTalk 1.4. When I go into the Speech control panel, the only option I have is Voice, which lets me select a different voice. I am unable to turn Speakable Items on.

3) I just installed PlainTalk 1.4. When I go into the Speech control panel, the Voice option is grayed out and I am unable to select a different voice.

DISCUSSION -----

1) The Voices Folder has been moved or deleted from the Extensions Folder of the System Folder. The Voices Folder is required for the Text-to-Speech software to operate. Reinstalling the Text-to-Speech software will get the voice files back.

2) You have the Text-to-Speech portion of PlainTalk 1.4 installed. In order to have the Speakable Items (as well as Listening and Feedback) options, you need to install the Speech Recognition software.

3) You have the Speech recognition portion of PlainTalk 1.4 installed. To get the voice option within the Speech control panel you need to install the English or Mexican Spanish Text-to-Speech software.

Network Server: Modify AIX Shell Environment Variables (4/96)

Revised: 4/8/96
Security: Everyone

Network Server: Modify AIX Shell Environment Variables (4/96)

=====

Article Created: 8 April 1996

TOPIC -----

I just modified my .profile file in my home directory to set some of my environment variables like VISUAL (to choose a command line editor) and PS1 (to modify the command line prompt). However, I've logged in and out and none of these environment variables have been set as in my .profile file. I switched to the csh and used the .login file to set environment variables and found the same problem.

DISCUSSION -----

In your home directory there is a file called .dtprofile which is used to set environment variables so they are available to all applications on the Common Desktop Environment (CDE). By default, the desktop does not read your standard \$HOME/.profile or \$HOME/.login files. This can be changed by uncommenting the DTSOURCEPROFILE variable assignment at the end of this file. The desktop reads .profile if your \$SHELL is "sh" or "ksh", or .login if your \$SHELL is "csh".

To learn more about which variables to set where, read the comments at the top of the .dtprofile file in your home directory which is copied below.

```
#####  
### Your $HOME/.dtprofile is read each time you login to the Common  
### Desktop Environment (CDE) and is the place to set or override  
### desktop environment variables for your session. Environment  
### variables set in $HOME/.dtprofile are made available to all  
### applications on the desktop. The desktop will accept either sh or  
### ksh syntax for the commands in $HOME/.dtprofile.  
###  
### By default, the desktop does not read your standard $HOME/.profile  
### or $HOME/.login files. This can be changed by uncommenting the  
### DTSOURCEPROFILE variable assignment at the end of this file. The  
### desktop reads .profile if your $SHELL is "sh" or "ksh", or .login  
### if your $SHELL is "csh".
```

```
###
### The desktop reads the .dtprofile and .profile/.login without an
### associated terminal emulator such as xterm or dtterm. This means
### there is no available command line for interaction with the user.
### This being the case, these scripts must avoid using commands that
### depend on having an associated terminal emulator or that interact
### with the user. Any messages printed in these scripts will not be
### seen when you log in and any prompts such as by the 'read' command
### will return an empty string to the script. Commands that set a
### terminal state, such as "tset" or "stty" should be avoided.
###
### With minor editing, it is possible to adapt your .profile or .login
### for use both with and without the desktop. Group the statements not
### appropriate for your desktop session into one section and enclose
### them with an "if" statement that checks for the setting of the "DT"
### environment variable. When the desktop reads your .profile or .login
### file, it will set "DT" to a non-empty value for which your .profile
### or .login can test.
###
### example for sh/ksh
###
###     if [ ! "$DT" ]; then
###         #
###         # commands and environment variables not appropriate for desktop
###         #
###         stty ...
###         tset ...
###         DISPLAY=mydisplay:0
###         ...
###     fi
###
###     #
###     # environment variables common to both desktop and non-desktop
###     #
###     PATH=$HOME/bin:$PATH
###     MYVAR=value
###     export MYVAR
###     ...
###
### example for csh
###
###     if ( ! ${?DT} ) then
###         #
###         # commands and environment variables not appropriate for desktop
###         #
###         stty ...
###         tset ...
###         setenv DISPLAY mydisplay:0
###         ...
###     endif
###
###     #
###     # environment variables common to both desktop and non-desktop
```

```
###      #
###      setenv PATH $HOME/bin:$PATH
###      setenv MYVAR value
###      ...
###
###      Errors in .dtprofile or .profile (.login) may prevent a successful
###      login. If after you login, your session startup terminates and you
###      are presented with the login screen, this might be the cause. If
###      this happens, select the Options->Sessions->Failsafe Session item on
###      the login screen, login and correct the error. The
###      $HOME/.dt/startlog and $HOME/.dt/errorlog files may be helpful in
###      identifying errors.
###
#####

#
#  If $HOME/.profile (.login) has been edited as described above,
#  uncomment the following line.
#
#DTSOURCEPROFILE=true
```

Color OneScanner 600/27: SCSI Port Depends on Configuration 4/96

Revised: 4/12/96
Security: Everyone

Color OneScanner 600/27: SCSI Port Depends on Configuration 4/96

Article Created: 9 April 1996
Article Reviewed/Updated: 12 April 1996

TOPIC -----

There are two connectors on the Apple Color OneScanner 600/27, which of these should I use?

DISCUSSION -----

The Apple Color OneScanner 600/27 has two SCSI connectors. The connector you use depends on where the scanner is placed in the SCSI chain. Appendix C of the Color OneScanner 600/27 User's Guide contains information on the various locations in the SCSI chain, and what the SCSI termination should be set to.

Below is a chart providing the basic information provided in Appendix C of the Color OneScanner 600/27 User's Guide.

Scanner is the ONLY device in the SCSI Chain
=====

Use the Macintosh SCSI System Cable. The Macintosh SCSI System Cable has a 50-pin connector on one end, and a 25-pin connector on the other. The 25-pin connector goes to your Macintosh computer, the 50-pin connectors goes to the Color OneScanner 600/27.

Begin_Graphic

(1) 25-pin Connector

- (2) 50-pin Connector
- (3) SCSI system cable

End_Graphic

Scanner is at the Beginning of the SCSI Chain

=====

When you have multiple SCSI devices an the Color OneScanner 600/27 is placed at the beginning of the SCSI chain, you need two (2) Macintosh SCSI System Cables, and a SCSI peripheral cable for each additional SCSI device.

Begin_Graphic

- (1) 25-pin connector
- (2) 50-pin connector
- (3) SCSI system cable
- (4) SCSI peripheral cable

End_Graphic

Scanner is in the Middle of the SCSI Chain

=====

If you have the Apple Color OneScanner 600/27 in the middle of a SCSI chain, you need two SCSI Systems cables and a SCSI peripheral cable.

Begin_Graphic

- (1) 25-pin connector
- (2) 50-pin connector
- (3) SCSI system cable
- (4) SCSI peripheral cable

End_Graphic

SCSI termination information is explained in the Tech Info Library article titled "Apple Color OneScanner 600/27: Terminator isn't required".

Article Change History:

12 Apr 1996 - Corrected SCSI cable diagram.

Color StyleWriter 1500: No Printer Tray Available (4/96)

Revised: 4/9/96
Security: Everyone

Color StyleWriter 1500: No Printer Tray Available (4/96)

=====

Article Created: 9 April 1996

TOPIC -----

The Apple Color StyleWriter 1500 User's Guide indicates there is some type of paper receiving tray, but I do not see one.

DISCUSSION -----

The manual is incorrect. Although an output tray is mentioned in a couple of different places, there is no output paper tray on the Color StyleWriter 1500 printer. The front panel of the printer extends past down the base plate and precludes installing an output paper tray.

Enhanced PCI-Based Power Macintosh Models: New Features (4/96)

Revised: 4/26/96
Security: Everyone

Enhanced PCI-Based Power Macintosh Models: New Features (4/96)

Article Created: 9 April 1996
Article Reviewed/Updated: 26 April 1996

TOPIC -----

What are the differences between the previous PCI-based Power Macintosh computers and the enhanced (speedbump) PCI-based Power Macintosh computers.

DISCUSSION -----

The new features in the enhanced PCI-based Power Macintosh computers include:

- Faster processor speeds: up to 150 MHz
- A second-level (L2) cache for higher performance in most models
- Larger sizes of internal hard disks: up to 2 GB
- The latest release of the Mac OS: System 7.5.3
- Multihoming support

Processor Types and Speeds

The clock speeds for the microprocessors in the enhanced Power Macintosh 7200, 7500, 8500, and 9500 computers are increased over their earlier counterparts. In addition, the microprocessor in the Power Macintosh 7600 is a PowerPC 604 instead of the PowerPC 601 used in the original Power Macintosh 7500. The updates are as follow:

Begin_Table

Model	Processor Type	Processor Clock Speed	Processor Bus Speed
Power Macintosh 7200	PowerPC 601	120 MHz	40 MHz
Power Macintosh 7600	PowerPC 604	120 MHz	40 MHz

Power Macintosh 8500	PowerPC 604	132 MHz	44 MHz
Power Macintosh 8500	PowerPC 604	150 MHz	50 MHz
Power Macintosh 9500	PowerPC 604	150 MHz	50 MHz

End_Table

Second-Level Cache
=====

All of the enhanced PCI-based Power Macintosh models, except the lowest-priced Power Macintosh 7200 models, include a second-level (L2) cache. The L2 cache provides up to 40% better performance.

The L2 cache in the Power Macintosh 9500/150 consists of 512 KB of fast static RAM. The size of the cache in the other models is 256 KB. The table in the configurations section of this article depicts this information.

Hard disk drive
=====

The internal hard drives of the enhanced PCI-based Power Macintosh computers consist of either 800 MB, 1.2 GB, or 2 GB. The table in the configurations section of this article depicts this information.

Macintosh System 7.5.3 1
=====

The enhanced PCI-based Power Macintosh computers include the latest version of the Mac OS, System 7.5.3. For a description of the new features of System 7.5.3,

Configurations
=====

Begin_Table

Model	DRAM	Hard Drive	L2 Cache
=====	====	=====	=====
Power Macintosh 7200/100	8 MB	800 MB	-
Power Macintosh 7200/120	8 MB	1.2 GB	-
Power Macintosh 7200/120	8 or 16 MB	1.2 GB	256K
Power Macintosh 7600/120	16 MB	1.2 GB	256K
Power Macintosh 8500/132	16 MB	1.2 GB	256K
Power Macintosh 8500/150	16 MB	2 GB	256K

Power Macintosh 9500/150

16 MB

2 GB

512K

End_Table

Multihoming

=====

The enhanced models of the PCI-based Power Macintosh computers have a new version of the Curio IC, CurioPrime, that supports multihoming. Multihoming, also called multiporting, makes it possible for AppleTalk to be active on more than one network port on the computer at the same time.

Multihoming is most important for Macintosh computers with PC Compatible cards installed so users can have simultaneous TCP/IP and Netware sessions.

Macintosh 5400 & 6400: PCI Expansion Slot (11/96)

Revised: 11/15/96
Security: Everyone

Macintosh 5400 & 6400: PCI Expansion Slot (11/96)

Article Created: 9 April 1996
Article Reviewed/Updated: 15 November 1996

TOPIC -----

What type of expansion slots do the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers have? Are the slots an LC-PDS compatible slot similar to those found in the Power Macintosh 5200 and 5300 series computers?

DISCUSSION -----

The I/O expansion slots in the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers are PCI (peripheral component interconnect) expansion slots and are not compatible with LC-PDS expansion cards, such as those compatible with the Macintosh LC family of computers, the Macintosh 630 series, or with cards that operate in the I/O expansion slot in Power Macintosh 5200, 5300, 6200, and 6300 series computers.

The Power Macintosh 5400 series and the Macintosh Performa 6360/160 computer have one PCI expansion slot whereas the Macintosh Performa and Power Macintosh 6400 series have two PCI expansion slots. These computers accept standard 7-inch (6.88-inch) PCI cards as defined by the PCI Local Bus Specification, Revision 2.0. The PCI bus is a 32-bit multiplexed address and data bus, and does not support the optional 64-bit bus extension signals or cache support signal. The PCI expansion slot has a 33.33 MHz system clock.

A total of 15 watts of power is provided for the PCI expansion slot. Both 5 volts and 3.3 volts are supplied; the total power consumed by both voltages must not exceed the 15-watts maximum.

To install a PCI card into Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers, you need to install a right angle PCI adapter into the PCI expansion slot on the logic board. This adapter is included with these computers and replacement adapters are available from Apple-authorized Service Providers.

The following computers are in the corresponding Macintosh families:

- Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.
- Macintosh 5300CD family: Macintosh 5300/100 LC, Performa 5300.
- Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.
- Macintosh 6300CD family: Performa 6300, Performa 6290

Macintosh 5260,5400,6400 & 6360: L2 Cache Differences (11/96)

Revised: 11/15/96
Security: Everyone

Macintosh 5260,5400,6400 & 6360: L2 Cache Differences (11/96)

Article Created: 9 April 1996
Article Reviewed/Updated: 15 November 1996

TOPIC -----

I realize that the Power Macintosh 5260/100, Power Macintosh 5400 and 6400, Macintosh Performa 6400 series, and Macintosh Performa 6360/160 computers accept an optional 256K L2 Cache Card. However, I'd like to know if they use the same card, and if not, if the two cards are compatible with each other.

DISCUSSION -----

Although the Power Macintosh 5260/100, Power Macintosh 5400 and 6400, Macintosh Performa 6400 series, and Macintosh Performa 6360/160 computers accept an optional High-Performance Module (256K L2 cache card), the modules are not interchangeable. The Power Macintosh 5260/100 accepts a 160-pin L2 cache SIMM card whereas the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers accept a 160-pin L2 cache DIMM card.

For the Power Macintosh 5260/100, you need to use the High-Performance Module for Power Macintosh 5260, part number M4849LL/A.

The Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers require the High-Performance Module for Power Macintosh 5400 and Performa 6400, part number M4505LL/A.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Power Macintosh 5400 & Performa 6400:Communications Slot (11/96)

Revised: 11/15/96
Security: Everyone

Power Macintosh 5400 & Performa 6400:Communications Slot (11/96)

Article Created: 9 April 1996
Article Reviewed/Updated: 15 November 1996

TOPIC -----

Is the communications slot in the Power Macintosh 5400 and 6400 series; Macintosh Performa 6400 series; and the Macintosh Performa 6360/160 computers compatible with the communications slot in the Power Macintosh 5200 and 5300 series computers?

DISCUSSION -----

Overview

The logic board in the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers has a communications slot that allows the computer to support a communications module without occupying the PCI expansion slot. The PCI-bus based communications slot connector is a 112-pin half-height microchannel connector. Cards that use the communications slot are memory mapped into the I/O space of these computers through the parallel bus.

Compatibility

The communications slots in the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers are PCI bus compatible slots and are, in general, not compatible with communication cards that are used with the Macintosh LC family of computers, the Macintosh 630 series, or Power Macintosh 5200, 5300, 6200, and 6300 series computers. The Tech Info Library article titled, "Communications Slot: Specifications" has more information about the communications slot used with Power Macintosh 5200, 5300, 6200, and 6300 series computers.

Such cards will not physically fit into the communications slot of the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers because the communications slot is keyed at the opposite end (notches). If you line up the notches to install a comm slot I card* into these

computers, the connector will face inwards, which will prevent you from being able to use the card. In addition, the two communications slots are not fully signal compatible.

The exception is that cards which do not use the bus, such as serial modem cards, can be designed to work in either type of communications slot. The power, ground, serial, and audio signals of the communications slots in the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers are located on the connector in such a way that a dual-keyed (cutout) modem card will fit and operate in the Macintosh LC family of computers, the Macintosh 630 series, or Power Macintosh 5200, 5300, 6200, 6300 series computers, and Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers communications slot.

Serial modems designed for universal operation must not attempt to access the parallel bus of either the 68030-bus or the PCI-bus communications slots to be compatible in both configurations.

*Note: To distinguish between those cards that are compatible with the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers from those compatible with earlier models, the communication slots themselves are named distinctly. The communications slot in previous models is referred to as "comm slot I" whereas the slots in the Power Macintosh 5400 and Macintosh Performa 6400 are called "comm slot II".

Installation

A communications card can be installed by either the user or an Apple-authorized Service Provider. The communications card is mounted vertically in the connector and its I/O connector is accessed through the communications port access hold on the right hand side of the back panel.

Available Cards

Apple announced several Ethernet CS II (Communication Slot II), including:

- 10BaseT (twisted pair) Ethernet Card (M4772ZM/A)
- 10Base2 (thin coax) Ethernet Card (M4773ZM/A)
- AAUI (Apple standard) Ethernet Card (M4774ZM/A)

The Power Macintosh 5400/120 and the Power Macintosh 6400/200 include the 10BaseT Ethernet CS II Card, but it and the other cards will also be available as standalone cards as well. The Macintosh Performa 6400 series and the Macintosh Performa 6360/160 computers do not include an Ethernet Card, but they do have an internal 28.8 kbps Global Village or Apple Geoport modem installed in the communications slot.

Note:

The following computers are in the corresponding Macintosh families:

- Macintosh 630CD family: LC 630, Quadra 630, Performa 630, Performa 635,

Performa 636, Performa 637, Performa 638, and Performa 640.

- Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.

- Macintosh 5300CD family: Macintosh 5300/100 LC, Performa 5300.

- Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.

- Macintosh 6300CD family: Performa 6300, Performa 6290

Macintosh Performa 6320CD: Description (9/96)

=====

Article Created: 10 April 1996
Article Reviewed/Updated: 25 September 1996

TOPIC -----

This article contains a description of the Macintosh Performa 6320CD.

DISCUSSION -----

Overview

=====

The Macintosh Performa 6320CD is a powerful and versatile system that brings you increased system speed and built-in video-in and TV tuner capability.

The Apple Macintosh Performa 6320CD computer uses a state-of-the-art PowerPC 603e processor running at 120 megahertz to deliver the highest performance available to date in the Performa product line.

The Performa 6320CD will meet your needs well into the future, not only with its robust performance, but also with a 1.2-gigabyte hard drive--large enough to store applications and information for years to come.

This affordable system includes multimedia features that can be expensive add-ons with other computers. A quadruple-speed CD-ROM drive accesses CD-based data quickly and plays audio and video segments smoothly. Stereo 16-bit sound provides high-quality audio playback, while an audio-input port lets you record your own sounds. The Performa 6320CD also includes the Apple TV/Video System, which allows users to connect to external video sources and capture images as well as view television programming with the aid of a TV antenna.

The machine also comes with special features for telephony. The high-speed internal fax modem works with the Apple PlainTalk microphone (included with the computer) and special software to let you use the computer as a speakerphone and a digital answering machine.

A trial version of America Online is included with every Performa 6320CD

..TIL19594-Macintosh_Performa_6320CD-Description_9-96_(TA35299).pdf

computer. Subscribers can access World Wide Web sites, Internet electronic mail—and, of course, the news and information provided by America Online.

The 6320CD is a complete, ready-to-use multimedia system. Packed in one box are the computer (with Apple System 7.5 software already loaded), a color display, a keyboard, a mouse, an internal modem, and a microphone. Also included are more than a dozen home, education, and home-business programs, plus a collection of multimedia reference CDs.

Features

=====

Complete, ready-to-use system

- Computer, color display, keyboard, mouse, and all necessary cables in one box
- Apple System 7.5 software, including Apple Guide software for step-by-step help with basic system operation, QuickTime multimedia software, and Macintosh PC Exchange software
- Internal fax modem supports speeds up to 28.8-kbps data and 14.4-kbps electronic fax send/receive as well as speakerphone and digital answering machine capabilities
- Built-in quadruple-speed, tray-loading CD-ROM player
- Front-panel volume control and headphone/speaker jack
- CD-quality digital sound
- Apple TV/Video System

Included software

=====

- Macintosh System 7.5.3
- At Ease 2.0.3
- Adobe Acrobat 2.0.1
- Apple Video Player
- Global Fax
- Connectix Desktop Utilities 1.0.4z
- HyperCard Player 2.3
- ClarisWorks 4.0v4
- Quicken 96 SE (Special Edition)
- America Online 2.6
- MegaPhone for Performa
- WealthBuilder
- Espresso
- MacLink Plus/Easy Open Translators
- At Ease
- Virex
- The Writing Center
- The American Heritage Dictionary
- Mangia Special Edition
- ClickArt Performa Collection
- MacGALLERY Clip Art Treasure Pak
- Power Pete
- Lode Runner

CD-ROM titles

=====

- The Grolier Multimedia Encyclopedia
- TIME Almanac Reference Edition
- 3D Atlas
- The Family Doctor
- Smithsonian's America
- Avid VideoShop
- Club KidSoft CD
- Sesame Street Numbers
- My First Incredible, Amazing Dictionary
- Making Music by Voyager
- Descent
- Hollywood
- Buried in Time
- Allied General
- F/A-18

Ordering Information

=====

Macintosh Performa 6320CD 16/1.2GB/4xCD/28.8

- Macintosh Performa 6320CD computer with 16 MB of RAM, 1 MB of video memory, built-in AppleCD 600i internal quadruple speed CD-ROM player, 1.4 MB Apple SuperDrive floppy disk drive, internal 1.2 GB hard disk drive
- Global Village 28.8 internal modem
- Apple Multiple Scan 15" Display
- AppleDesign Keyboard
- Apple PlainTalk microphone
- Order number M4957LL/A

Optional Enhancements

- Apple MPEG Media System

Order No. M4243LL/A

- Apple Video System

Macintosh Performa 6320CD: Technical Specifications (9/96)

Revised: 9/25/96
Security: Everyone

Macintosh Performa 6320CD: Technical Specifications (9/96)

=====

Article Created: 10 April 1996
Article Reviewed/Updated: 25 September 1996

TOPIC -----

This article contains the technical specification for the Macintosh Performa 6320CD.

DISCUSSION -----

Microprocessor

=====

- PowerPC 603e processor running at 120 MHz
- Integrated floating-point unit
- 40 MHz, 64-bit bus
- 256K level 2 cache
- 32K internal cache

Memory

=====

- Comes with 16 MB of RAM (uses one SIMM socket)
- Expandable to 64 MB of RAM using two 32 MB SIMMs
- Uses 72-pin, noncomposite, 80-nanosecond or faster DRAM SIMMs

Disk drives

=====

- Internal 1.2GB hard disk drive
- Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal, quadruple-speed AppleCD 600i CD-ROM drive

Modem

=====

- Internal, up to 28.8-kbps data and 14.4-kbps electronic fax send/receive

- Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)

Sound

=====

- Stereo 16-bit sound
- Built-in speaker
- Sound-output port
- Sound-input port (can be used to connect the Apple PlainTalk microphone included with the computer)
- Front headphone jack and volume control

Interfaces

=====

- Apple Desktop Bus port for mouse, keyboard, and other devices
- Monitor port (also supports connection to an NTSC or PAL video-out interface box, such as the Apple Presentation System)
- Serial port (RS-232/RS-422) for an AppleTalk network connection, other networking or communications equipment, or a printer
- SCSI interface port for connecting as many as five external SCSI devices, such as disk drives or CD-ROM drives
- LC processor-direct expansion slot
 - Compatible with most Macintosh Performa 400 and 500 series; Performa 630; Macintosh Quadra 605; and Macintosh LC II, LC III, LC 475, LC 550, LC 575, and LC 630 processor-direct cards
 - Can be used for an Apple MPEG Media System card or other specialized card
- Communications slot for a modem (used by Global Village modem)
- Composite and S-video inputs for video viewing and capture
- Integrated TV tuner to attach to TV antenna
- Infrared remote control

Display support

=====

- Apple displays up to 15 inches through a 1 MB DRAM video buffer (independent of system RAM)
- Wide range of VGA and SVGA displays from other vendors

Color support

=====

- Offers 16-bit color for display of up to 32,768 colors on monitors using 640x480-pixel resolution
- Provides 8-bit color for display of 256 colors on monitors using 800xpixel or 832x624-pixel resolution

Electrical requirements

=====

- Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- Frequency: 50 to 60 Hz
- Power: 55 W maximum

Size and weight

=====

- Height: 4.3 in. (10.95 cm)

- Width: 12.6 in. (32.0 cm)
- Depth: 16.5 in. (41.9 cm)
- Weight: 19 lb. (8.6 kg)

Operating environment

=====

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 5% to 95%, noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- CloseView software magnifies image up to 16 times
- Easy Access software for sequential combination keys, and cursor control from the numeric keypad
- "Visual beep" replaces audible system alerts

Apple Multiple Scan 15 Display

=====

- 15-inch diagonal RGB color display (13.3-inch diagonal viewable image size)
- Up to 832x624-pixel resolution at a scan frequency of 75 Hz
- 0.28-mm dot pitch
- Meets the strictest international magnetic-field emissions requirements (SWEDAC MPR2)
- Height: 16.7 in. (42.4 cm)
- Width: 15.9 in. (40.5 cm)
- Depth: 17.8 in. (45.2 cm)
- Weight: 31.0 lb. (14 kg)

AppleDesign Keyboard

=====

- Provides adjustable keyboard slope
- Includes function keys, numeric keypad, cursor arrow keys, and special screen-editing keys

Apple Desktop Bus Mouse II

=====

- Round shape fits contour of the palm of the hand
- Large button allows easy clicking and dragging

MacTCP on PCI-Based Macintosh Computers Not Supported (5/96)

Revised: 5/8/96
Security: Everyone

MacTCP on PCI-Based Macintosh Computers Not Supported (5/96)

Article Created: 10 April 1996
Article Reviewed/Updated: 8 May 1996

TOPIC -----

Can I run the MacTCP control panel on my PCI-based Power Macintosh computer (7200, 7500, 8500, or 9500)?

DISCUSSION -----

No, you should not have MacTCP running on PCI-based Power Macintosh computers. Prolonged use of MacTCP can damage system software to the extent that Open Transport networking will not work properly. If Open Transport no longer functions properly, you need to perform a clean installation of the system software as described in the Power Macintosh User's Guide that came with the computer. The information below is from the PCI-based Power Macintosh Read Me files, and it recommends removing MacTCP.

Important Information About Open Transport Networking

MacTCP

After you install new networking software on your hard disk, if you have problems with TCP/IP applications, look in the Control Panels folder for a MacTCP file. If one is there, remove it from the Control Panels folder and restart your computer. Each time you install new networking software, you may want to verify whether or not the software's installer also installed MacTCP, and follow this procedure.

Article Change History:
08 May 1996 - Included additional information on clean system install.

At Ease and Open Transport: 680x0 Computers Issue (4/96)

Revised: 4/10/96
Security: Everyone

At Ease and Open Transport: 680x0 Computers Issue (4/96)

=====

Article Created: 10 April 1996

TOPIC -----

I'm using At Ease on a 680x0-based Macintosh computer. After installing System 7.5 Update 2.0 and enabling Open Transport with the Network Software Selector, my computer hangs during startup, while the extensions are loading.

DISCUSSION -----

As of March 1996, At Ease is not compatible with Open Transport. This includes all versions, At Ease 3.0.1 and earlier.

The work around is to use Classic AppleTalk instead of Open Transport. A future update for At Ease will correct this issue.

Power Macintosh 5400 & Performa 6400: Adding Memory (11/96)

Revised: 11/26/96
Security: Everyone

Power Macintosh 5400 & Performa 6400: Adding Memory (11/96)

Article Created: 10 April 1996
Article Reviewed/Updated: 26 November 1996

TOPIC -----

I need to add memory to my Power Macintosh 5400/120 computer, but I'm not sure what type of memory I need to purchase. Does this computer use SIMMs or DIMMs?

DISCUSSION -----

Compatibility
=====

The Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers use JEDEC-standard 168-pin DIMMs (dual inline memory module) DRAM cards rather than the 72-pin SIMM DRAM cards used in the Power Macintosh 5200 and 6200 computers. The DIMMs should be 64-bit-wide, 168-pin fast-paged mode, 70ns RAM access time or faster, and 2K refresh rate. Although you can use EDO memory in the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers, you will not experience any benefit from doing so. SIMMs from older Macintosh computers are not compatible with your computer and should not be used.

Additionally, you cannot necessarily use the same DIMMs as you can in other PCI-based Power Macintosh computers such as the 7200, 7500, 7600, 8500, and 9500 series computers. These other Power Macintosh computers can support DIMMs with either a 2K or 4K refresh rate. However, the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers can only support DIMMs with a maximum of a 2K refresh rate*. DIMMs incorporating 4K refresh parts will function in these computers but at half the memory density. For example, the computers will only recognize 16 MB of a 32 MB DIMM, and so on.

To prevent compatibility problems, Apple has contacted major RAM developers in several ways. In the Developer Notes for the Power Macintosh 5400/120 and for the Macintosh Performa 6400 series, the following note was added:

"DRAM DIMM developers should note that the PSX memory controller on the main logic board of the Power Macintosh 5400 computer does not provide support for 4 M by 4 bits (12 by 10 addressing) or 1 M by 16 bits (12 by 8 addressing) DRAM devices."

Additionally, Apple sent a message to specific vendors which stated:

"The PSX memory controller does not support 4Mx4 DRAM devices with 12 by 10 addressing nor 1Mx16 devices with 12 by 8 addressing. Other 16 MBit devices are compatible, for a full list refer to the Developer Note."

The following RAM developers received this note:

- Vikking
- Techworks
- SQP
- Southland
- PNY
- Newer Technology
- Lifetime, Kingston
- Delta Lu, Comtech
- Apple Japan

DIMMs available from Apple Computer are 2K refresh rate only so you can safely use them in your Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers.

*Notes:

- Refresh rates lower than 2K, such as 256K or 1K are also supported.
- The only memory devices with a 4K refresh rate which is supported on the Power Macintosh 5400/120 and Macintosh Performa 6400 series are 2M x 8 devices with 12 x 9 addressing.

Expansion

=====

The Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers have two RAM expansion slots on the logic board. You can use any DRAM configuration with DIMMs of these sizes: 8, 16, 32, or 64 MB. The exact configuration depends on the density of the DRAM chips that are mounted on the DIMMs.

You can increase your computer's DRAM to up to a maximum of 136 MB (the 8 MB that comes on your computer's logic board, plus an additional 128 MB for a total 136 MB).

DIMMs can be installed one or more at a time. The Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers support only linear memory organization. Therefore, no performance gains are seen when two DIMMs of the same size are installed. Any size DIMM can be installed in either DIMM slot, and the combined memory of all of the DIMMs installed will be configured as a contiguous memory space.

Article Change History:

26 Nov 1996 - Clarified refresh rate support.

15 Nov 1996 - Added 6360.

17 Sep 1996 - Corrected expansion information.

CyberDog: Q&A about Java & Netscape (7/96)

Article Created: 10 April 1996
Article Reviewed/Updated: 2 July 1996

TOPIC -----

This article contains information on how OpenDoc, Cyberdog, and Java work together. This information is contained in the Apple product slick titled "Harnessing component software & the Internet. OpenDoc & Cyberdog."

DISCUSSION -----

"With the advent of OpenDoc and Java, there is now a unique opportunity for two very powerful technologies to work together. OpenDoc's component approach and Java's portability make for a powerful combination." —Joshua D. Wachs, president, Natural Intelligence, Inc.

"Cyberdog allows our users to create personalized living documents that contain live Internet data." —Roger Bell, president, Digital Harbor, L.C.

There are two powerful forces driving today's worldwide software industry. One force is component software. The other is the Internet. OpenDoc and Cyberdog harness those two forces, providing opportunities and benefits for developers and users alike.

Here is a look at OpenDoc and Cyberdog: how they relate to each other, and to technologies such as Java (from Sun Microsystems) and Netscape Navigator (from Netscape Communications Corporation).

Question: How do OpenDoc and Cyberdog relate to each other?

Answer: OpenDoc is an open, multiplatform architecture for component software: self-contained, reusable software modules. It is supported by CI Labs, a nonprofit association of more than 300 industry leaders that includes Apple Computer.

Apple used OpenDoc to create Cyberdog, a new technology that integrates network services into the Mac OS, bringing live links and views of the Internet to any document. And making the Internet as easy to use as a Macintosh computer.

Question: How are OpenDoc and Java similar?

Answer: OpenDoc and Java are each based on the premise that, in the future, software will be composed of small modules that can be bound together at run time. The creators of both technologies believe that this will lead to greater innovation in the marketplace, and more customized solutions for users.

Question: How are OpenDoc and Java different?

Answer: OpenDoc is a component architecture. Java is an object-oriented programming language. The OpenDoc architecture contains everything necessary for a complete component architecture, including persistent storage. OpenDoc components can be written in any language including Java.

Question: Do OpenDoc and Java compete with each other?

Answer: OpenDoc and Java are, in fact, complementary technologies. Apple intends to ensure that OpenDoc and Java work together. For example, an OpenDoc component can be written to understand how to execute Java applets. In this way, Java applets can be embedded within any OpenDoc container application, not just in an Internet browser. OpenDoc can become the bridge between today's desktop applications and tomorrow's network-based applets.

Question: What will drive a developer's choice of language when writing OpenDoc components?

Answer: Developers will choose whether to use C, C++, or Java on a case-by-case basis. If cross-platform development is the primary goal—and performance less of an issue—Apple expects many developers to choose Java. If high performance and tight integration with the operating system are paramount, developers are likely to use C or C++.

Question: What are the benefits Cyberdog offers to users?

Answer: The conventional Internet model is to "put everything into the browser." The new Cyberdog model is "put the browser everywhere." Cyberdog allows users to integrate live Internet data in their desktop applications, by embedding Cyberdog components (such as the web browser) into any OpenDoc-compatible application. For example, ClarisWorks. This brings live links and views of the Internet to any document, whether it's a monthly report, lesson plan, or executive information system.

Question: How does Cyberdog relate to other Internet technologies?

Answer: Cyberdog fits in between browsers, such as Netscape Navigator, and HTML authoring tools, like Adobe PageMill. Cyberdog, with its ability to embed live Internet data into OpenDoc documents, allows users to create—and store on the desktop—custom views of the Internet.

Question: Will users choose Cyberdog over Netscape Navigator?

Answer: Most users are likely to have both Netscape Navigator and Cyberdog on their systems. Apple believes that users who want to just quickly browse a web site will continue to use Netscape Navigator. Users who want to integrate the Internet into their desktop applications—or create custom Internet solutions—will use Cyberdog.

Question: Does the Netscape plug-in architecture compete with OpenDoc?

Answer: OpenDoc is a general-purpose component architecture. It does not compete with the Netscape plug-in architecture, which is a highly specialized mechanism for adding viewers to Netscape Navigator. An OpenDoc component that allows any Netscape plug-in to work with any OpenDoc container application, would demonstrate the complementary nature of the two architectures.

Cyberdog Development Opportunities

=====

Created entirely with OpenDoc, Cyberdog integrates network services into the Mac OS, bringing live links and views of the Internet to any document. It makes the Internet as easy to use as a Macintosh. Apple designed Cyberdog to create a ready market for developers. Developers can ship it with their products. And every Cyberdog component can be replaced or enhanced. Developers can create replacement web or Gopher browsers, Notebooks, Logs, or other Cyberdog components. Or they can choose to offer Cyberdog users totally new functionality. Perhaps a videoconferencing component, or real-time "chat" capabilities. Other opportunities include developing tools to analyze and manipulate raw data from the Internet. All application developers can realize benefits from Cyberdog. For instance, by simply adding OpenDoc support to your existing applications, you also get Cyberdog. Which gives you Internet connectivity, without recoding your software. Find out more about OpenDoc and Cyberdog.

System 7.5 Update 2.0: Removes MacTCP Token Ring Ext. (4/96)

Revised: 4/18/96
Security: Everyone

System 7.5 Update 2.0: Removes MacTCP Token Ring Ext. (4/96)

Article Created: 10 April 1996
Article Reviewed/Updated: 18 April 1996

TOPIC -----

I have a Macintosh computer running TCP/IP on a Token Ring network. I recently installed System 7.5 Update 2.0, but now I am unable to select Token Ring in the MacTCP control panel. What's going on?

DISCUSSION -----

During the installation of System 7.5 Update 2.0, the MacTCP Token Ring extension is removed. However, the extension is necessary to run TCP/IP protocol over a Token Ring network from a Nubus-based Macintosh computer. To resolve this, you'll need to reinstall the MacTCP Token Ring extension. If you do not have the disks from which you originally got the MacTCP Token Ring extension, you can download it from the online services.

Power Macintosh 5260/100: Description (4/96)

Revised: 4/15/96
Security: Everyone

Power Macintosh 5260/100: Description (4/96)

Article Created: 10 March 1996
Article Reviewed/Updated: 15 April 1996

TOPIC -----

This article contains a description of the Power Macintosh 5260/100 computer.

Note: This computer is only available through educational channels.

DISCUSSION -----

The Power Macintosh 5260/100 computer brings 100-MHz PowerPC processor performance to a new low cost. And this is a system that can grow as your needs change, with such options as 256K of Level 2 cache memory to further boost processor performance, and a wide variety of multimedia, networking, and communications expansion cards.

The Power Macintosh 5260 is an all-in-one system, so it's economical, easy to set up, and easy to start using. And it's optimized for multimedia, with built-in features and expansion slots that let you enjoy stunning graphics, video, and audio now, and add advanced features later.

Already included in the main unit are a 14-inch color display (diagonal viewable image size 12.3 inches), an 800-megabyte hard disk, a 1.4 MB floppy disk drive, a quadruple-speed CD-ROM drive, a microphone, and stereo speakers. The whole system is on a tilt-and-swivel base that lets you position it precisely for the most comfortable viewing. A keyboard and mouse are also provided.

The 16-bit sound provides high-quality audio playback through the built-in stereo speakers or external speakers (not included). You can record voice, music, and other audio of your own choosing through the front microphone or the rear audio-input port.

Multimedia expansion is easy on the Power Macintosh 5260 computer. Your computer comes with special slots for video-input, TV-tuner, and communications or networking cards. A general-purpose slot supports a variety of expansion

..TIL19601-Power_Macintosh_5260-100-Description_4-96_(TA35308).pdf

options, such as an MPEG card for viewing CD-ROM-based movies and interactive "edutainment" programs. You can also add video-output capability to display your Macintosh screen on a TV or a projection system, or to record your work on a VCR.

Features

=====

Complete, ready-to-use system

- Computer, 14-inch color display (12.3-inch diagonal viewable image size), CD-ROM drive, floppy disk drive, hard disk, micro-phone, and speakers built into one unit
- Matching keyboard, mouse, and all necessary cables
- Apple System 7.5 software, including Apple Guide software for step-by-step help with basic system operation, and QuickTime multimedia software
- Built-in quadruple-speed, tray-loading CD-ROM player
- Front-panel volume control and headphone/speaker jack
- CD-quality digital sound

Ordering Information

=====

Power Macintosh 5260/100

- Computer with built-in 14-inch display (12.3-inch diagonal viewable image size), 800MB hard disk, quadruple-speed CD-ROM drive, and Apple SuperDrive floppy disk drive. Mouse, keyboard, and cables also included.
- Order No: M4982LL/A

Optional Enhancements

- High Performance Module
(256K Level 2 Cache)
Order No. M4849LL/A

- Apple MPEG Media System
Order No. M4243LL/A

- Apple Video System
Order No. M2894LL/C

- Apple TV/Video System
Order No. M2896LL/C

- Apple External Video Connector
Order No. M4099LL/A

- Apple Presentation System
Order No. M2895LL/A

- Apple Ethernet CS Twisted-Pair Card
Order No. M3065Z/A

- Apple Ethernet CS AAUI Card

Order No. M3066Z/A

- Apple Ethernet CS Thin Coax Card

Order No. M2708Z/A

Power Macintosh 5260/100: Technical Specifications (8/96)

Article Created: 10 April 1996
Article Reviewed/Updated: 27 August 1996

TOPIC -----

This article contains the technical specifications for the Power Macintosh 5260/100 computer.

Note: This computer is only available through educational channels.

DISCUSSION -----

Microprocessor

- 100-MHz PowerPC 603e
- 16K internal cache
- 40-MHz, 64-bit bus
- Optional 256K Level 2 Cache

Memory

- 16 MB of RAM, expandable to 64 MB
- Two 72-pin, 70ns DRAM SIMM slots, no RAM soldered on-board.

Disk Drives

- Built-in Apple SuperDrive 1.4 MB floppy disk drive, which uses high-density floppy disks and reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks
- Internal 800 MB IDE hard disk drive
- Internal quadruple-speed AppleCD 600i CD-ROM drive

Expansion Slots

- One 114-pin LC 030 PDS slot
- One 112-pin Communications slot for modem or Ethernet card supporting these

Apple Ethernet cards:

- Apple Ethernet CS Twisted Pair Card
- Apple Ethernet CS Thin Coax Card
- Apple Ethernet CS AAUI Card
- One 60-pin video input slot for realtime video display
- One L2 Cache SIMM slot

Ports

- One Mono sound input port
- One Stereo sound output port (16-bit)
- One Apple Desktop Bus (ADB) port
- Two serial (RS-422) ports (do not support GeoPort)
- One SCSI port for connecting as many as six external devices (including CD-ROM)

Display

- 14-in (12.3-inch diagonal viewable image size) shadow-mask color display
- Video Modes: 640x480 @ 16-bit
- .28 mm dot pitch
- 66.67 Hz refresh rate
- Tilts from

Sound

- 16-bit on-board stereo sound output and mono sound in (16-bit CD and video)
- Built-in stereo speakers
- Sound-output ports
- Sound-input port
- Front headphone jack and volume control
- Built-in monophonic microphone

Expansion interfaces

- LC processor-direct slot for networking, communications, and multimedia expansion, such as a modem, Ethernet card, or MPEG video card
 - Compatible with most Macintosh Performa 400 and 500 series; Macintosh Quadra 605; Macintosh LC II, LC III, LC 475, LC 550, LC 575, and LC 630; Performa 630; and Performa and Power Macintosh 5200, 5300, 6200, and 6300 series

processor-direct cards

- Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- Two RS-232/RS-422 serial ports for an AppleTalk network connection, other networking connections, communications equipment, or a printer (some models include built-in modem that uses one serial port)
- SCSI interface port for as many as five external SCSI devices, such as disk drives or CD-ROM drives
- Communications slot for Ethernet card or fax/data modem card
- Video slot for video-input card (such as the Apple Video System)
- TV tuner connector and infrared control sensor for TV tuner card (such as the

Apple TV/Video System)

Electrical requirements

- Line voltage: 110 to 240 V AC, RMS, single phase, nominal
- Frequency: 50 to 60 Hz
- Power: 240 W maximum
- U.S. EPA Energy Star compliant

Size and weight

- Height: 17.5 in. (44.5 cm)
- Width: 15.1 in. (38.3 cm)
- Depth: 16 in. (40.6 cm)
- Weight: 45 lb. (20.5 kg)

Operating environment

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° F (-40° to 47° C)
- Relative humidity: 20% to 95%, noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Disability access

- CloseView software magnifies screen image up to 16 times
- Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- "Visual beep" replaces audible system alerts

System 7.5 Update 2.0: Drive Setup, HD SC Setup Install (4/96)

Revised: 4/10/96
Security: Everyone

System 7.5 Update 2.0: Drive Setup, HD SC Setup Install (4/96)

=====

Article Created: 10 April 1996

TOPIC -----

Where can I find and install Drive Setup 1.0.4 which is mentioned in the following Read Me files?

System 7.5 Update 2.0: What's New in This Update (3 of 3)
System 7.5 Update 2.0: Overview and Installation Read Me

DISCUSSION -----

The following applications can be installed with the Custom Install option of the System 7.5 Update 2.0 installer:

- Apple HD SC Setup 7.3.5
- Battery Recondition 1.3 (certain PowerBook computers only)
- Drive Setup 1.0.4
- Disk First Aid 7.2.2
- SimpleText 1.3.1

You can install these applications by following the steps below:

- 1) Double-click the Installer icon.
- 2) Read the Welcome to System 7.5 Update Installer, then click Continue.
- 3) In the Destination Disk section of the Install System 7.5 Update window, in the lower left corner, click Switch Disk until the hard disk you want to install the software on appears.
- 4) Select Custom Install in the Easy Install pop-up menu, upper right corner.
- 5) Click on the triangle to the left of Application.
- 6) Select the applications you want to installed by clicking its checkbox.
- 7) Click Install.
- 8) Click Restart when the installation is completed.

Look in the Apple Extras folder for the applications you just installed.

System 7.5.3: How to Install Desktop Printers (4/96)

Revised: 4/11/96
Security: Everyone

System 7.5.3: How to Install Desktop Printers (4/96)

Article Created: 11 April 1996

TOPIC -----

I reinstalled the System 7.5.2 software on my PowerBook 5300cs, then I installed the System 7.5 Update 2.0. After doing this, I checked the LaserWriter printer driver. The LaserWriter driver is version 8.3.3, however I do not have the desktop printer icons.

How can I get this functionality? Why is it not included with the System 7.5 Update 2.0?

I did find Desktop Printing Software SW 1.0.3. The ReadMe file stated that I should not use this software unless desktop printing had already been installed. I installed it anyway, and it did not work.

DISCUSSION -----

Desktop Printing Software is included with System 7.5 Update 2.0, it is in TOME 7, however you must use the Custom Install feature to install it. Within the "Custom Install" area of the Installer, expand the "Printing SW Updates" item and click the "Desktop Printer 1.0.3" box. This installs all of the necessary resources for Desktop Printing. You will also need to enable Background Printing in the Chooser.

There are a couple of other ways to obtain the latest version of Desktop Printing software using specific printer installers such as Color LaserWriter 12/600 8.3.2 installer, Color StyleWriter 2500 installer, or Color StyleWriter 1500 installer.

The standalone Desktop Printing SW 1.0.3 installer ReadMe states a need for an earlier version of desktop printing software because of these other component requirements; Finder v7.1.4, Clipping Extension, Networking Extension, Thread Manager, Drag & Drop extension, and the Dragging Enabler.

Apple Media Tool 2.0: Mouse Up Events Issue (4/96)

Revised: 4/11/96
Security: Everyone

Apple Media Tool 2.0: Mouse Up Events Issue (4/96)

=====

Article Created: 11 April 1996

TOPIC -----

In Apple Media 2.0, when trying to use a "Mouse Up" event for an object, the event is sent regardless of whether the pointer is within the hot spot of the picture when the mouse is released.

DISCUSSION -----

This behavior is being investigated by Engineering. In the meantime, there is a workaround.

Workaround
=====

For any object where this "Mouse Up" behavior is a problem, include a "Mouse Leave" event with a "Go to itself" link. This should prevent the Mouse Up event from processing when the mouse is released outside of the hot spot. However, this workaround may affect the playback of sounds and movies any time the pointer leaves that hot spot.

MacPPP 2.5 and AICK 1.0 (4/96)

Revised: 4/11/96
Security: Everyone

MacPPP 2.5 and AICK 1.0 (4/96)

=====

Article Created: 11 April 1996

TOPIC -----

This article tells you how to obtain MacPPP v2.5 for use with the Apple Internet Connection Kit (AICK) 1.0.

DISCUSSION -----

MacPPP v2.5 is an upgrade to the current version of MacPPP. Apple recommends that all AICK 1.0 users upgrade to MacPPP v2.5. You can find MacPPP v2.5 at Apple Computer's online software update areas.

These articles can help you locate the software update mentioned:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

MacPPP v2.5 Read Me (4/96)

Revised: 4/11/96
Security: Everyone

MacPPP v2.5 Read Me (4/96)

Article Created: 11 April 1996

TOPIC -----

This article is the MacPPP version 2.5 ReadMe file.

DISCUSSION -----

Important Information about MacPPP v2.5 is in this Read Me. Before you install MacPPP v2.5, read the following information.

System Requirements

- Power Macintosh or Macintosh computer with a 68030 microprocessor or greater
- Macintosh system software version 7.5 or later
- MacTCP or Open Transport; if you are using Open Transport, you must use version 1.0.8 or later (version 1.1 is strongly recommended)

Open Transport Users

Open Transport v1.1 is strongly recommended for use with the Apple Internet Connection Kit and MacPPP. You must use Open Transport v1.0.8 or later.

Apple's System 7.5 Update 2.0 will install Open Transport v1.1 for you. Look for information about this update and others on Apple forums and Apple Web sites on the Internet.

Installing MacPPP v2.5

Make sure you've quit all open applications before you attempt to install MacPPP.

To install MacPPP on your hard drive, drag the MacPPP file onto your System Folder icon. If you are installing over an older version of MacPPP it will tell that an older version is installed, and ask for permission to install the newer

version. Click on the OK button. MacPPP will be automatically installed into your Extensions folder. Restart your Macintosh.

MacPPP is now installed.

Problems While Connecting

If you encounter problems while connecting and you use the Apple Internet Connection Kit, try the following:

Throw away the PPP Preferences file (located in the Preferences folder in your System Folder). Run the Apple Internet Dialer, and then Quit. The Apple Internet Dialer will create new MacPPP Prefs for you. Restart your Macintosh.

Changes From MacPPP v2.1.4

MacPPP v2.5 offers a number of bug fixes and changes from v2.1.4, which was included in the Apple Internet Connection Kit v1.0.

In addition to improved error handling, MacPPP v2.5 is now compatible with the following:

- Virtual Memory
- Apple Macintosh PowerBook computers
- Faceless background applications
- Berkeley Systems' After Dark screen saver
- most major third party Internet utilities

All Apple Internet Connection Kit v1.0 users should upgrade to MacPPP v2.5.

Apple Internet Connection Kit: FAQ (10/96)

Revised: 10/28/96
Security: Everyone

Apple Internet Connection Kit: FAQ (10/96)

Article Created: 12 April 1996
Article Reviewed/Updated: 28 October 1996

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) on the Apple Internet Connection Kit (AICK).

IMPORTANT: First make certain the computer meets AICK requirements:

- Type of Macintosh - 68030 microprocessor or newer computer.
- System Software - System 7.5 or later (for Apple Guide and MacTCP), Open Transport users should use version 1.1.1 or later.
- Amount of RAM - minimum 8 MB RAM, preferred 16 MB or more depending on how many Internet applications are running.
- Modem - minimum 9600 or 14,400 bps modem (28,800 bps recommended).

Questions in this FAQ

-
- 1) I keep getting "Not enough memory to launch Netscape" errors, what should I do?
 - 2) I keep getting "PPP timeout" errors when clicking Dial in the Apple Internet Dialer. What should I do?
 - 3) I get "DNS errors" in Netscape, what can I do?
 - 4) I cannot get AICK to install, and I get this error message, "Can't install to hard drive. A problem was found." What can I do?
 - 5) I keep getting a "Resource File" is damaged error when I try to open the Apple Internet Dialer. What can I do?
 - 6) I keep getting a PPP not active error when I try to open the Apple Internet Dialer. How do I fix this?

7) My settings in Config PPP and MacTCP are not being saved. How do I save them?

8) I cannot receive or send e-mail with E-Mailer Lite, however, I appear to connect to the Internet fine. What can I do?

DISCUSSION -----

1) Question: I keep getting "Not enough memory to launch Netscape" errors, what should I do?

Answer: Some Internet programs have an issue running with Virtual Memory (VM) turned on. When you are performing setup troubleshooting on those programs, it would be better to start with VM off, and turn VM on later, once the Internet software is setup and working properly.

It may be difficult to run Internet software with less than 8 MB RAM. Software that runs without color like e-mail, Gopher, Telnet, and others may be possible depending on how much RAM is used by System Software. However, Worldwide Web (WWW) browsers by themselves may use 4 MB to 8 MB RAM, or more, depending on which pluggins or add-ons are installed and in use.

Internet software can consume large amounts of RAM, especially if these applications remain open over time. It is fairly easy, on a Macintosh, to continue opening new windows, images, data files, and so on -- all of which use RAM. This is similar to a word processing application which will eventually run out of RAM, if we keep opening different files.

There are basically two ways you might run short of RAM on your Macintosh. An individual application like a WWW browser or e-mail program, could run out of RAM -- this is an Application RAM problem. The other is that system software may not have enough room to grow dynamically in the Macintosh computer's overall (or total) RAM space -- this is typically referred to a system heap problem (or system RAM problem).

2) Question: I keep getting "PPP timeout" errors when clicking Dial in the Apple Internet Dialer. What should I do?

Answer: PPP timeout errors usually occur when the PPP software is unable to set up its connection. There are several things to check:

First, make sure your modem is properly connected (a) to your Macintosh, (b) to the telephone line, and (c) that the modem is turned on. This accounts for most PPP timeout error messages.

Second, did you hear a dial tone prior your modem's attempting to connect? If not, check the phone line for proper dial tone; most modems let you connect a telephone to check for dial tone. If your modem does not allow a connection, you can take the modem's phone line and connect it to your telephone. If the modem's line does not have a proper dial tone, it will not work and PPP timeout errors will occur.

Third, check the modem selection and initialization (init) string. The Dialer includes the ability to select, add, or modify modem init strings. In the modem selection pop-up menu, an Add/Modify Modem command is available at the very top of the menu. This information is stored in the Modem Information preference file.

An init string is a group of commands and settings sent to the modem to start it, so it can function properly. Please see the TIL article entitled, "Modem Initialization Strings for MacPPP Access" for the correct string for your modem, or check with the modem manufacturer. Further information on init strings is also available by searching in the Tech Info Library using the search string "modem and initialization and string". Many modem manufacturer's web sites now exist for product information, software updates, and technical information such as modem init strings.

Additionally, your modem manufacturer or Internet service provider (ISP) may have additional suggestions for avoiding conflicts with PPP software. Generally, it may be helpful to turn off fax software, or other third-party additions to System Software, with the Extensions Manager control panel. Be careful to leave any needed telecom software -- like MacTCP or TCP/IP, Global Village Toolbox, Express Modem, and so on -- turned on.

Also, it may be helpful to zap the PRAM (clear the parameter RAM) on your Macintosh. This is especially helpful if you see an error message indicating that the serial port is in use. For further information on this, please see Tech Info Library article "How To Reset Parameter RAM". If you do zap PRAM, you may need to check that VM is off.

3) Question: I get "DNS errors" in Netscape, what can I do?

Answer: DNS (Domain Name Service), to use a simple explanation, is like a giant phone book for the Internet. It lets you type "http://www.apple.com" in a web browser and a DNS server on the net will return the proper IP address for this destination. Your web browser will then make it's query again, using the numerical IP address. It's easier for us to remember www.apple.com than 17.254.3.21 (the IP address for the www.apple.com host). Note that you can also type "http://17.254.3.21" and it works just like "http://www.apple.com". There are several reasons why you may get DNS errors, and several things you can do to fix them.

First, remove the file called MacTCP DNR (domain name resolver) from the root (or top level) of your system folder. This file will be recreated automatically when you restart your Macintosh, whether you are running classic networking (MacTCP) or Open Transport (TCP/IP). The DNR file may become corrupted, and removing it, should resolve some connection problems. Removing the MacTCP DNR file is the first and most important troubleshooting tip for AICK, and should be used prior to other actions. To replace the MacTCP DNR file, drag it to the Trash, restart your computer by choosing Startup from the Special menu, then empty the Trash.

Second, WWW Browsers sometimes can experience a corrupted cache file which could cause problems when logging on. Locate your browser's cache folder and drag it

to the Desktop Restart your computer and try the browser again. If it works now, it probably was a corrupted cache item.

Third, check to make sure you have the proper settings from your ISP. AICK stores these settings in the Apple Internet Dialer. If you have a backup of your Dialer settings, the Dialer can handle the backup and restoring of these settings. You can also check these settings in the MacTCP or TCP/IP control panels. This information must be correct for DNS to work.

Finally, the MacTCP prep file or TCP/IP Preferences file may be corrupted. These files are located in the System Folder's Preferences folder. There is less reason to throw these files away, unless your network administrator or ISP suggests that you do so.

WARNING: Throwing either the MacTCP prep file, or TCP/IP Preferences file in the Trash will result in a loss of your TCP/IP settings. Be sure you have this information written down and saved.

4) Question: I cannot get AICK to install, and I get this error message, "Can't install to hard drive. A problem was found." What can I do?

Answer: Try the following to resolve the issue:

- Unlock the System Folder by using the General Controls control panel and turn off System Folder Protection.
- Check to see if the Launcher is locked, if it is locked, unlock it.
- If you are still unable to reinstall AICK, Custom Remove the AICK software, do a clean install of your System Software to put a fresh System Folder on your hard drive and then reinstall AICK.

5) Question: I keep getting a "Resource File" is damaged error when I try to open the Apple Internet Dialer. What can I do?

Answer: The Dialer includes the ability to backup your providers settings, and restore from that backup. You can do this from the Dialer's File menu, choose "Backup Provider Information..." or "Restore Provider Information...". All users should perform a backup and save it. If a "Resource File is damaged" error occurs, you can restore good copies of the needed files from a previously saved backup.

This Backup function copies the files from Preferences/Internet Dialer Folder, so the restore function will not generate fresh preference files. Therefore, it is possible to backup files that may already be corrupted, and thus possibly restoring corrupted files. It is recommended that users backup their Internet Dialer Folder soon after the software is successfully set up.

If a backup with good settings is not available the Internet Dialer Prefs, Modem Information, reg server and <username> files in the Internet Dialer Folder of the Preferences Folder, can be moved to the Trash and reconfigured from the Dialer after restarting the computer.

If the Resource File is damaged error still occurs, check the following files:

- MacTCP DNR
- MacTCP Prep or TCP/IP preferences
- PPP preferences

Try moving these files to the Desk Top and restarting. Be aware some ISP information may need to be entered again. Having backup copies of MacTCP Prep or TCP/IP Preferences file, and PPP Preferences file is also advisable, but remember to compress them or keep them on a volume separate from the startup disk.

6) Question: I keep getting a PPP not active error when I try to open the Apple Internet Dialer. How do I fix this?

Answer: Typically, this error is caused by a corrupted PPP Preferences file which is located in the Preferences folder. Try replacing the PPP Preferences file by moving the PPP Preferences file to another hard disk, floppy, or compress this file. Be sure you have the PPP configuration information available because you may have to enter this information again after restarting the computer.

NOTE: Having more than one copy of PPP Preferences or MacTCP Prep on your startup disk may cause problems.

NOTE on SLIP software: SLIP software is not supported with the Internet Dialer. The Dialer is specifically set to work with PPP. The Dialer may not work properly if there is active SLIP software in the Control Panels or Extensions folders.

7) Question: My settings in Config PPP and MacTCP are not being saved. How do I save them?

Answer: It appears you are trying to configure the settings directly in Config PPP and MacTCP or TCP/IP control panels. All of these settings should be configured in the Apple Internet Dialer. Open the Apple Internet Dialer and choose Define Provider Information from the Provider menu to enter the information given by your Internet Service Provider.

If you do not want to use this preferred method as stated above, you can use the control panels TCP/IP, MacTCP, Config PPP, and so on. However, be aware that these control panels may support multiple configurations. If a second configuration is selected that does not match the information for a corresponding control panel, for example Config PPP with TCP/IP, then the Dialer may not work properly. For this reason, setting up your configuration information using the Apple Internet Dialer is recommended.

8) Question: I cannot receive or send email with EMailer Lite, however, I appear to connect to the Internet fine. What can I do?

Answer: Please check the following:

- Verify you have a good Internet connection by connecting to a web site.
- Make sure you are connected to the Internet before opening Emailer Lite.
- Make sure you are using the "Connect Now" command in Emailer Lite.
- Choose Internet Setup command in the Setup menu.
- The Internet Service Entry window must be filled in correctly for Emailer Lite to work properly. Verify the fields are filled out as shown below. If it's not, disable "Use Internet Configuration System" option and enter the information in the fields again. Or, locate the Internet Config application to correct the information in the Internet Config extension. Remember to Save this new information also.

The information should be in this format:

```
Account Name  = User's login           - this must be filled in
User Name     = User's actual name      - this must be filled in
Email address = User's Email address    - Internet Config *
Mail Account  = Example, Loginname@popserver.ISP.com - Internet Config *
Password      = User's Login Password   - Internet Config *
SMTP host     = The SMTP server host name. - Internet Config *
               For example from the Mail
               Account example above,
               the entry would be "popserver.ISP.com". **
```

Select Save and go to Connect Now. Make sure both Get and Send are enabled.

* Internet Config gets these values from the Internet Dialer. If you deselect the Internet Config checkbox, these fields will become blank and you will need to fill them in. Normally, the Internet Config values (the ones you inputted with the Dialer), should be fine.

** Some Internet mail administrators will set up a different server for sending mail. You will be told by your ISP or in house provider if this is the case. In this case, your SMTP host might be "smtp.ISP.com". This is because sending mail (simple mail transfer protocol or smtp) is a different protocol from receiving mail from a POP3 (Post Office protocol version 3) server. Therefore, on busy sites, administrators may wish to split up these functions over different machines.

Security: Everyone

AICK 1.0, Apple Internet Dialer, & Open Transport 1.1 (5/96)

=====

Article Created: 12 April 1996
Article Reviewed/Updated: 7 May 1996

TOPIC -----

After installing System 7.5 Update 2.0 on both my PowerBook 280c and PCI-based Power Macintosh computers, I started receiving this error message, "MacTCP does not work with Open Transport. You must use Open Transport TCP. Remove the MacTCP control panel.", when using the Apple Internet Dialer v1.0. Here is what happened with both computers.

PowerBook 280c

I used the Network Software Selector to switch to Open Transport 1.1 networking software. After restarting, I checked the TCP/IP control panel settings which looked fine. I then launched the Apple Internet Dialer 1.0 and the error message appeared.

I looked for MacTCP in the control panel, but it was not there. I opened the Extensions Manager control panel for MacTCP, but it was not listed. I switched back to classic networking and the Apple Internet Dialer worked properly without an error message.

PCI-based Power Macintosh

After launching the Apple Internet Dialer I got the error message. I again looked for MacTCP in the control panel, but it was not there. I opened the Extensions Manager control panel for MacTCP, but it was not listed. I tried to find MacTCP with Find File, but it was not found.

Questions

- 1) How can I get rid of this error message, and use the Internet Dialer with Open Transport 1.1?
- 2) Is there a compatibility issue between the Apple Internet Connection

Kit's (AICK) Internet Dialer and Open Transport 1.1?

DISCUSSION -----

There is no compatibility issue between the Apple Internet Dialer and Open Transport 1.1. The issue is the way the Internet Dialer looks for the MacTCP control panel. The dialer looks for a file, with MacTCP's type, creator, and name "MacTCP" to be present in the Control Panels folder.

Below is a description of what happens:

- On 680x0 processor based computers (like your PowerBook) and PowerPC processor based with NuBus computers (like Power Macintosh 6100, 7100, 8100), the Network Software Selector makes the MacTCP control panel invisible in the Control Panels folder, resulting in the Internet Dialer finding MacTCP and reports the error.
- On PowerPC processor based with PCI computers (like Power Macintosh 7200, 7500, 8500, 9500), the System 7.5 Update 2.0 installer places an invisible copy of the MacTCP control panel in the Control Panels folder. The Internet Dialer finds MacTCP and reports the error.

NOTE: You cannot use the Network Software Selector to switch to Classic AppleTalk on PCI-based Power Macintosh computers.

Workaround

=====

680x0-based, and PowerPC and NuBus-based Computers

Follow the steps below:

- 1) With classic networking enabled, open the Control Panels folder.
- 2) Create a folder. You may, for example, name it Classic MacTCP. (It does not matter where the new folder is located on your hard disk.)
- 3) Move MacTCP out of the Control Panels Folder and into the folder you just created above.
- 4) Use Network Software Selector to switch to Open Transport 1.1.
- 5) Restart. The Dialer should now work as expected.

PowerPC and PCI-based Computers

The invisible MacTCP file can be removed from the Control Panels folder by either making MacTCP visible with ResEdit or other third-party utility and throwing MacTCP into the trash, or by using the steps below.

- 1) Click and drag the Control Panels folder to the desktop.

- 2) Restart. (A new Control Panels folder will be created in the System Folder.)
- 3) Move the contents of the Control Panels folder located on the desktop, to the new Control Panels folder located in the System Folder. The invisible files will remain in the Control Panels folder on the desktop.
- 4) Put the Control Panels folder located on the desktop in the trash, and empty the trash.
- 5) Restart. The Dialer should now work as expected.

NOTE: You may have to create a new Control Panels alias in the Apple Menu Items folder if it does not function properly.

QuickTime 2.5: Product Description (5/97)

Article Created: 12 Apr 1996
Article Reviewed/Updated: 5 May 1997

TOPIC -----

This article is a description of Apple QuickTime 2.5.

DISCUSSION -----

QuickTime is the industry-standard multimedia architecture used by software tool vendors and content creators to integrate, edit, synchronize, store, and playback video, sound, graphics, text, and music.

QuickTime is open, published, and extensible allowing developers and creative professionals to create stunning content and titles for delivery on CD-ROM, Internet, and professional video.

Available for Macintosh, Windows 3.1, Windows 95, Windows NT, OS/2, and other platforms, QuickTime makes "author once, playback anywhere" a reality.

QuickTime supports any compression/decompression standard including MJPEG, Cinepak, Indeo, and others, minimizing the size and maximizing the playback quality of your multimedia content.

For digital video professionals, QuickTime supports multiprocessing systems, enables professional-quality video editing, and supports SMPTE time code.

The powerful QuickTime Music Architecture provides music professionals and multimedia developers the opportunity to include custom sound synthesizers and instruments in music tracks, giving their content a distinctive aural presence.

Used by more Internet, content, and tool developers, QuickTime has become the most pervasive technology for creating and integrating multimedia content on CD-ROM and the Internet.

Features

- Pervasive playback standard for CD-ROM and Internet content. With more than 1,500 leading title developers already licensing QuickTime, and over 100 new QuickTime enhanced titles introduced each month, QuickTime continues as the standard format for CD-ROM and Internet content delivery.
- Support for multiple data types. QuickTime enables developers to provide customers such unique features as multiple-language text tracks. Data types supported include video, sound, graphics, animation, text, music/MIDI, MPEG, sprite 3D, and copyright.
- Multiplatform playback. Develop once and deliver on many platforms. Avoid time-consuming platform conversion tasks and reach millions of Macintosh and Windows users. Shared Mac OS and Windows data files allow production of hybrid disks.
- Built-in synchronization. QuickTime makes it easy to synchronize sound, video, music, and other data tracks to a common time base.

Color StyleWriter LocalTalk Modules: Question & Answers (6/96)

Revised: 6/25/96
Security: Everyone

Color StyleWriter LocalTalk Modules: Question & Answers (6/96)

Article Created: 12 April 1996
Article Reviewed/Updated: 25 June 1996

TOPIC -----

This article contains information on the Color StyleWriter LocalTalk options available for the Color StyleWriter 2400 and Color StyleWriter 2500 printers.

DISCUSSION -----

There are two LocalTalk modules available:

+=====+		
Printer	Apple Part #	Description
+=====+		
	M4615ZM/A	LocalTalk Module for both CSTW
Color StyleWriter 2400		2400 & 2500.
	+-----+	
	M3458G/A	LocalTalk Module ONLY for CSTW
		2400.
+-----+		
Color StyleWriter 2500	M4615ZM/A	LocalTalk Module for both CSTW
		2400 & 2500.
+-----+		

Questions & Answers
=====

Question: What do the LocalTalk Modules look like? Are they cards? Are they identical?

Answer: The Color StyleWriter LocalTalk Options are external modules. They connect to the back of the printer and plug into the serial port. The LocalTalk Options are not cards. They look identical except for the writing on the module itself. The Color StyleWriter 2400 LocalTalk Module (M3458G/A) does not have any writing on it, the Color StyleWriter 2400/2500 LocalTalk Module (M4615ZM/A) says

LocalTalk module for the Color StyleWriter 2400 and 2500.

Question: Which printers do the Color StyleWriter LocalTalk modules work with?

Answer: The Color StyleWriter LocalTalk Module M3458G/A only works with the Color StyleWriter 2400. The Color StyleWriter LocalTalk Module M4615ZM/A works with both the Color StyleWriter 2400 and Color StyleWriter 2500.

Question: What printer drivers do I need? Is there a Color StyleWriter 2400 AppleTalk/Color StyleWriter 2500 AppleTalk driver?

Answer: You use the printer driver that ships with the printer. The driver supports both serial and LocalTalk connections. There is not an AppleTalk StyleWriter driver for either printer. However, the Color StyleWriter 2500 driver is backward compatible and can be used with either printer.

Article Created: 15 April 1996

TOPIC -----

I have a Power Macintosh 9500 with System Enabler 1.0 on it. Do I need to update my computer using the Power Macintosh 9500 CD version 2.0 before installing System 7.5 Update 2.0?

DISCUSSION -----

No, you can simply update your system using System 7.5 Update 2.0. System 7.5 Update 2.0 is a set of system software enhancements that improves the reliability and performance of all computers running system software version 7.5, 7.5.1, or 7.5.2.

Pwr Mac Processor Crds & Logic Brd Upgrades: Descriptions (2/97)

=====

Article Created: 15 April 1996
Article Reviewed/Updated: 21 February 1997

TOPIC -----

This article contains descriptions of the Power Macintosh Logic Board Upgrades and the Power Macintosh Processor Upgrade Card.

DISCUSSION -----

Overview
=====

If you're a Macintosh owner who wants to gain the advanced capabilities of more powerful Power Macintosh models without sacrificing your previous investments, Apple has good news for you.

Logic board upgrades

Logic board upgrades are now available that give any Power Macintosh 7200 series system the advanced capabilities of the Power Macintosh 7600 series, and that turn Macintosh Quadra 800 or 840AV, or Power Macintosh 8100 computers into Power Macintosh 8500 series systems.

These upgrades feature processor upgradability, so you can select the Power Macintosh Processor Upgrade Card that best meets your requirements -- secure in the knowledge that if your needs change, you can easily upgrade to a faster processor in the future.

If you own a Power Macintosh 7200 series computer, the Power Macintosh 7600 Logic Board Upgrade can transform your system into a Power Macintosh 7600 series system, with video-input capabilities.

The Power Macintosh 8500 Logic Board Upgrade works in much the same way, transforming your Macintosh Quadra 800, Macintosh Quadra 840AV, or Power Macintosh 8100 into the advanced Power Macintosh 8500 series.

High-performance features include a complete, near-broadcast-quality video-input/output subsystem that's optimized for video editing. And, as with the 7600 upgrade, you can opt for the processor of your choice, with no worry about obsolescence.

Power Macintosh Processor Upgrade Cards

The Power Macintosh Processor Upgrade Card is currently available in two processor speeds: one with a 120-megahertz PowerPC 604 RISC processor, and the other with the even more powerful 132-megahertz PowerPC 604. They work not only with the two Power Macintosh Logic Board Upgrades, but also with many of the existing Power Macintosh systems with Peripheral Component Interconnect (PCI) expansion slots.

Whatever Power Macintosh upgrade is right for you, you can rest assured that your investment in current equipment is protected, because your Power Macintosh was designed to provide the performance you need -- now and in the future.

Features of Power Macintosh Logic Board Upgrades

Available models

-
- Power Macintosh 7600
 - The 7200 to 7600 Logic Board Upgrade (M3842LL/A) will allow customers with a Power Macintosh 7200 to upgrade their systems to a Power Macintosh 7600.

NOTE:

This logic board upgrade ships WITHOUT a Processor Upgrade Card. Customers will have to purchase one separately which gives them the opportunity to decide how fast a processor they want to add to their system.

- Power Macintosh 8500
 - The Power Macintosh 8500 Logic Board Upgrade (M3807LL/C*) will allow customers with the following systems to upgrade to the Power Macintosh 8500:
 - Macintosh Quadra 800 computer
 - Macintosh Quadra 840AV computer
 - Power Macintosh 8100 series computers

* The /C revision of this logic board upgrade includes a software revision to accommodate 8xCD-ROM drives.

NOTE:

As with the 7200 to 7600 Logic Board Upgrade, a Processor Upgrade Card is NOT be included with the 8500 Logic Board Upgrade. Customers will have to purchase one separately which gives them the opportunity to decide how fast a processor they want to add to their system.

Power and speed

- Processor upgradability with choice of available PowerPC processor options.

Memory and storage

- Power Macintosh 7600 upgrade can use the existing RAM from your Power Macintosh 7200
- Power Macintosh 8500 upgrade comes with 8 MB of RAM
- Both upgrades retain existing hard disks
- 256K level 2 cache

Expansion slots

- Both logic board upgrades feature PCI expansion slots*

Additional capabilities

- Power Macintosh 7600 upgrade provides video-input capabilities
- Power Macintosh 8500 upgrade includes video-input/output subsystem

Installation

Logic board upgrades must be performed by an authorized Apple reseller or service provider.

Features of Power Macintosh Processor Upgrade Card

=====

Power and speed

- Includes PowerPC 604 processor with floating-point processor and 32K on-chip cache.

Ordering Information

=====

Power Macintosh 7600 Logic Board Upgrade*

- Order No. M3842LL/A
- Power Macintosh 7600 logic board with video-input capabilities
- Accessory kit with documentation and a CD-ROM containing system software version 7.5.3

* Requires processor purchase (see Processor Upgrade Card information); logic board upgrades must be performed by an authorized Apple reseller or service provider

Power Macintosh 8500 Logic Board Upgrade*

- Order No. M3807LL/C
- Power Macintosh 8500 logic board with video-input/output subsystem
- Accessory kit with documentation and a CD-ROM containing system software version 7.5.3

* Requires processor purchase (see Processor Upgrade Card information); logic board upgrades must be performed by an authorized Apple reseller or service provider

Power Macintosh 120MHz Processor Upgrade Card

- Order No. M4731LL/A (120 MHz)
- Card with 120 MHz PowerPC 604 with floating-point processor and 32K on-chip cache

Power Macintosh 132MHz Processor Upgrade Card

- Order No. M4875LL/A (132 MHz)
- Card with 132 MHz PowerPC 604 with floating-point processor and 32K on-chip cache

Power Macintosh 180MHz Processor Upgrade Card

- Order No. M5458LL/A (180 MHz)
- Card with 180 MHz PowerPC 604 with floating-point processor and 32K on-chip cache

NOTE:

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Power Macintosh Logic Board Upgrades
=====

Power and speed

- Processor upgrade card must be purchased separately; see chart for available options

Memory and storage

- Power Macintosh 7600 upgrade can use existing RAM from upgraded system; includes 256K L2 cache with 7600 logic board upgrade
 - Power Macintosh 8500 logic board upgrade includes 8MB of RAM and 256K level 2 cache
 - Both upgrades retain existing hard disks from upgraded system
- Video support, expansion, setup, system software, compatibility, and communications
- Identical to corresponding Power Macintosh models
(For detailed specifications on the Power Macintosh 7600 and 8500 series computers, see the appropriate product data sheets.)
 - Includes accessory kit with CD-ROM disc containing system software version 7.5.3

Installation

- Must be installed by an authorized Apple reseller or service provider

Article Reviewed/Updated: 29 May 1996

TOPIC -----

This article contains the technical specifications for the PC Compatibility Cards for Power Macintosh Computers.

DISCUSSION -----

Microprocessor

- Pentium 100-MHz processor or 586 100-MHz processor

Memory

PC Compatibility Card with Pentium processor

- 8 MB of RAM (soldered on card), expandable to 72 MB of local RAM (one 168-pin DIMM slot) for MS-DOS and Windows environments
- 256K level 2 cache

PC Compatibility Card with 586 processor

- One 8 MB (DIMM) of RAM installed in one 168-pin DIMM slot, expandable to 64 MB of local RAM for MS-DOS and Windows environments
- 128K level 2 cache

Sound

- Includes Sound Blaster 16-compatible support (DOS and Windows environments)
- 16-bit stereo output

Video Support

- Works with all Apple displays as well as with most third-party VGA and SuperVGA displays (for MS-DOS and Windows)
- 1 MB DRAM of display support (third-party displays may require a separate cable adapter)

Networking

- Supports Novell NetWare SPX/IPX, TCP/IP, and NETBEUI protocols in MS-DOS and Windows environment using the built-in Ethernet connector and ODI and NDIS 2.0 drivers (client software not included)

Compliance

- Compliant with PCI 2.0 requirements

Environmental Requirements

- Operating temperature: 50° to 104° F (10° to 40° C)
- Storage temperature: -40° to 116° (-40° to 47° C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Size And Weight

- PC Compatibility Card (with Pentium processor)
 - 12-inch card (30.5 cm)
 - 0.7 lb. (0.32 kg)
- PC Compatibility Card (with 586 processor)
 - 7-inch card (17.7 cm)
 - 0.46 lb. (0.21 kg)

Macintosh Compatibility

Both PC Compatibility Cards work with all Power Macintosh 9500, 8500, 7600, 7500, and 7200 series computers

PC Compatibility Cards for Power Macintosh: Description (4/97)

=====

Article Created: 15 April 1996
Article Reviewed/Updated: 16 April 1997

TOPIC -----

This article contains the descriptions for the PC Compatibility Cards for Power Macintosh Computers.

DISCUSSION -----

Overview

For people who want power, ease-of-use, and compatibility, Apple PC Compatibility Cards can turn your Power Macintosh computer into the most flexible, versatile system available.

Offering either a Pentium 100-megahertz processor on a 12-inch card or a 586 100-megahertz processor on a 7-inch card, these PC Compatibility Cards let you run MS-DOS and Windows applications directly on your Power Macintosh computer. You can switch instantly between Mac OS, Windows, and MS-DOS environments with a single keystroke.

With the PC Compatibility Cards, your Power Macintosh computer becomes a powerful dual micro-processor system. The Pentium pro-cessor delivers fast performance for MS-DOS and Windows applications. The 586 processor offers a more affordable option, yet still runs all the same applications.

Because the Power Macintosh PowerPC processor and the Pentium (or 586) processors work independently, you can run Macintosh and MS-DOS or Windows applications concurrently. In fact, you can even cut and paste information between them, as well as share folders and disks.

In addition, the PC Compatibility Cards help your Power Macintosh computer fit into your work environment better than ever. Once you install either card, your system will support MS-DOS and Windows net-work applications and services using

..TIL19620-PC_Compatibility_Cards_for_Power_Macintosh-Description_4-97.pdf

Novell NetWare SPX/IPX, TCP/IP, and NETBEUI protocols over the built-in Ethernet network connection—in addition to its standard Macintosh networking capabilities.

You can even run MS-DOS and Windows multimedia applications using your computer's built-in CD-ROM drive, with the built-in Sound Blaster-16 support.

In short, with a PC Compatibility Card for MS-DOS and Windows environments, you don't have to choose between operating systems—you can run more software than any other mainstream personal computer on the market.

Features

=====

PC Compatibility Card (with Pentium processor)

- Pentium 100-MHz processor with integrated floating-point unit (FPU)
- 256K level 2 cache
- 8 MB of RAM, expandable to 72 MB

PC Compatibility Card (with 586 processor)

- 586 100-MHz processor with FPU
- 128K level 2 cache
- 8 MB of RAM, expandable to 64 MB

General Compatibility Information (both cards)

- Allows a Power Macintosh computer with a Peripheral Component Interface (PCI) slot to run MS-DOS and Windows programs directly without software emulation
- Includes Microsoft MS-DOS 6.22
- Compatible with Windows 3.1, Windows for Workgroups 3.11, and Windows 95 (not compatible with Window NT or OS/2)
- Includes Sound Blaster-16 support for MS-DOS and Windows PC multimedia compatibility
- Supports single-keystroke switching between Mac OS, MS-DOS, and Windows environments
- Works with all current Apple displays as well as with most third-party VGA and SVGA displays
- Lets you copy and paste between Mac OS and Windows environments
- Prints from MS-DOS and Windows with a Mac OS-compatible printer (PostScript printer recommended for best performance)
- Supports Novell NetWare SPX/IPX, TCP/IP, and NETBEUI protocols in MS-DOS and Windows environment
- Includes PC game port

Macintosh Compatibility

Both the 7-inch 586 and 12-inch Pentium PC Compatibility Cards are compatible with all Power Macintosh computers that include Peripheral Component Interface (PCI) slots, including:

- Power Macintosh 7200-series computers
- Power Macintosh 7500-series computers
- Power Macintosh 7600-series computers
- Power Macintosh 8500-series computers
- Power Macintosh 9500-series computers
- Power Macintosh 5400/120-series computers*

*The Power Macintosh 5400/120 (M4781LL/A) supports the 7-inch (M4091LL/B), but NOT the 12-inch PC Compatibility Card M4092LL/A). The 7-in. PC Compatibility Card M4091LL/A will function in a 5400/120, though there are some cabling differences to accommodate the differences in case design.

Display Compatibility

Both cards work with all current Apple displays and with most third-party VGA and SVGA monitors.

DOS/Windows Compatibility

Both cards support MS DOS 6.22 (which ships with the cards) and Windows 3.1, Windows for Workgroups 3.11, and Windows '95 (any or all of which would have to be purchased separately). The cards are NOT compatible with Windows NT or OS/2.

The cards come with an ODI driver that supports Novell NetWare SPX/IPX, TCP/IP, and NETBEUI protocols in the MS-DOS and Windows environments.

They allow customers to print to Macintosh OS-compatible printers from either DOS or Windows.

Usage Requirements

The two PC Compatibility Cards require a PCI-based Power Macintosh computer. Only the 7-inch PC Compatibility Card (M4091LL/B; note revision B) is fully compatible with the Power Macintosh 5400/120 (M4781LL/A), which is sold only in the Education Market.

Bundled Software

The PC Compatibility Cards ship with MS-DOS 6.22 and with Macintosh System Software 7.5.3.

User Installation

-
- Dealer installation not required

Ordering Information

PC Compatibility Card (with Pentium Processor)

-
- Order No. M4092LL/A
 - Pentium 100-MHz processor with FPU and 256K level 2 cache on 12-inch PCI

card that runs MS-DOS 6.22, Windows 3.1, Windows for Workgroups 3.11, and Windows 95

- 8 MB of RAM, expandable to 72 MB
- System software version 7.5.3
- MS-DOS version 6.22
- Complete installation, learning, and reference documentation
- Limited one-year hardware warranty

PC Compatibility Card (with 586 Processor)

-
- Order No. M4091LL/B
 - 586 100-MHz processor with FPU and 128K level 2 cache on 7-inch PCI card that runs MS-DOS 6.22, Windows 3.1, Windows for Workgroups 3.11, and Windows 95
 - 8 MB of RAM, expandable to 64 MB
 - System software version 7.5.3
 - MS-DOS version 6.22
 - Complete installation, learning, and reference documentation
 - Limited one-year hardware warranty

NOTE:

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Newton Print Pack: HP LaserJet print solutions (4/96)

Revised: 4/15/96
Security: Everyone

Newton Print Pack: HP LaserJet print solutions (4/96)

=====

Article Created: 15 April 1996

TOPIC -----

I have an Apple MessagePad and an HP LaserJet printer. How can I print from the Apple MessagePad to the HP LaserJet?

DISCUSSION -----

You have two possible options:

- 1- Use the "Choose Network Printer" option in Newton OS 1.0 and 2.0.
- 2- Use the Newton Print Pack

Use the "Choose Network Printer" option in Newton OS 1.0 and 2.0

=====

All Apple MessagePads have a built-in PostScript/AppleTalk driver, very similar to the Mac OS printer driver "LaserWriter8". This means any AppleTalk-based networked laser printer is compatible with the Apple MessagePad. Some HP LaserJet printers have PostScript and AppleTalk built-in, and almost all models can be upgraded to support these features. HP Technical Support recommended checking the startup page for individual printers.

The Apple MessagePad functions as a LocalTalk device and supports several physical connections, so a serial cable can be used for a direct connection. LocalTalk connectors allow the Apple MessagePad to print to any supported printer on the AppleTalk network.

Use the Newton Print Pack

=====

LaserJet printers with a parallel port can print from an Apple MessagePad using the Newton Print Pack. The Newton Print Pack is sold separately, and only has

some specific LaserJet models lists. However, any Hewlett-Packard PCL-based printer should work with the Newton Print Pack.

The Newton Print Pack provides both a physical connection (serial to parrallel conversion) and a PCL driver for the NewtonOS.

Troubleshooting note:

If you are trying to print to an HP LaserJet that you believe has PostScript/AppleTalk support, and you cannot see it in the "select a Printer" window, try printing directly to the printer with a serial cable. Sometimes an AppleTalk networking problem prevents the Apple MessagePad from seeing the printer properly.

Apple MessagePad: Socketed ROM Won't Allow Upgrade (4/96)

Revised: 4/15/96
Security: Everyone

Apple MessagePad: Socketed ROM Won't Allow Upgrade (4/96)

=====

Article Created: 15 April 1996

TOPIC -----

Will the socketed ROM on the Apple MessagePad 120 and Apple MessagePad 130 allow customers to upgrade to a faster ARM processor?

DISCUSSION -----

The socketed ROM has nothing to do with the processor. The ROM is the read only memory where all the operating system information is stored.

Since the MessagePad 120 was introduced, the ROM has been socketed so that future Newton Operating System Updates can be easily performed.

To date the processor in the Apple MessagePads has not been socketed for easy removal or replacement. The same 20MHz ARM 610 RISC processor used in the original MessagePad is still being used in the current Apple MessagePad 130 devices.

AppleShare 4.2.x: File Server Memory & Cache Usage (4/96)

Revised: 4/17/96
Security: Everyone

AppleShare 4.2.x: File Server Memory & Cache Usage (4/96)

Article Created: 17 April 1996

TOPIC -----

This article describes how AppleShare 4.2 and 4.2.1 deal with memory and cache.

DISCUSSION -----

About the File Server cache

AppleShare 4.2 introduced a new method of caching that differed from previous versions of AppleShare. Briefly, AppleShare 4.2 (and 4.2.1) provides a single block cache that dynamically tunes itself for optimal performance. Once the server is up and running, AppleShare gradually expands until it allocates all available RAM to its cache. You can set aside a portion of RAM that can be used for other applications (as described in "How Much Memory Should Be Reserved for Other Applications?" later in this addendum); this portion is then unavailable for AppleShare's cache expansion.

By caching items (files, folder contents, icons) in RAM, the File Server provides faster access to those items than if they were retrieved from permanent memory on the server's hard drive.

See "Setting Cache Preferences" in Chapter 3 of the AppleShare Administrator's Guide for a general description of the cache and for the steps you need to take to configure the cache. The purpose of this addendum section is to provide additional useful information about the cache and about setting your cache preferences.

Size of the File Server Extension partition and cache

The File Server program (strictly speaking, the File Server Extension) requires 5.5 megabytes (MB) of memory when the program is first started. Of this amount, approximately 1 MB is reserved for file, folder, and icon caching. The memory that the File Server Extension uses is one component of the overall memory required by system software. Thus, the minimum of 5.5 MB of RAM that the File

Server Extension requires is part of the total memory displayed for "System Software" when you view your server's memory allocation. To view your server's memory allocation, choose "About This Macintosh" from the Apple menu while in the Finder.

If free RAM (that is, RAM not being used by system software or any applications) is available on your server, AppleShare uses it for its cache as needed. As the AppleShare cache expands, the amount of memory allocated to "System Software" in "About This Macintosh" grows accordingly.

How much memory should be reserved for other applications?

As explained in "Setting the Preferences" in Chapter 3 of the AppleShare Administrator's Guide, you can adjust the amount of memory reserved for other (non-File Server) applications in the File Server Cache Preferences window. When the AppleShare cache expands (because it requires more memory to cache items), it will not attempt to claim the amount of memory you've set aside for other applications.

Here are a few things to keep in mind when considering the amount of memory you plan to reserve for other applications:

- Apple recommends a minimum cache setting of 1 MB (the default setting); under most circumstances, this should be an adequate amount of memory to reserve for other applications.
- The Finder can perform poorly (or crash) if there is not any free memory for it to use; the value for "Memory to be reserved for other applications" should always be greater than zero.
- The AppleShare cache does not attempt to claim memory used by applications that have been opened prior to starting the AppleShare program, or for those applications that are running prior to AppleShare's cache expanding. So, if there are applications that you plan on using often on the server, consider starting them before you start the File Server program. For example, if you open a database application that has a 4 MB memory partition before you open the server (or before AppleShare tries to expand its cache), that 4 MB does not count toward the amount of memory reserved for other applications. Other applications that provide a network service, such as the Apple Remote Access MultiPort Server, should be started before you start the File Server.
- If you think that the 1 MB of cache contained within the 5.5 File Server Extension memory partition is sufficient for your file service needs, you can reserve all available RAM for other applications. For instance, for a server with 32 MB of RAM, you can set the value in the File Server Cache Preferences window to 32 MB. AppleShare will not attempt to allocate additional cache blocks.

Does AppleShare release RAM cache automatically?

Once AppleShare has claimed available memory for its cache, it does not automatically release the memory so that it can be used by other applications. However, you can flush the cache and free up RAM by choosing Reset Cache from

the Server menu and clicking OK.

NOTE: It may take up to two minutes for the cache to reset.

AMT 2.0: Play QTVR Movies on Monitor w/ Menu Bar (4/96)

Revised: 4/17/96
Security: Everyone

AMT 2.0: Play QTVR Movies on Monitor w/ Menu Bar (4/96)

=====

Article Created: 17 April 1996

TOPIC -----

I have a Power Macintosh 7500 computer, with two monitors attached. An NEC 17-in. monitor is connected to the video port of the Macintosh, and the other monitor is a NEC xv15 connected to the computer through an ATI Exclaim video card. I am working on an Apple Media Tool 2.0 project with QuickTime VR movies.

When I run a QuickTime VR movie and the playback screen is on the xv15 display, the picture may show on the screen, but never actually plays. If the run window is moved back to the 17-in. display, the QuickTime VR movie runs properly.

The movies play fine when viewed using QTVR Player.

DISCUSSION -----

Apple Media Tool may not display QuickTime VR movies correctly on monitors other than those that display the menu bar. If this happens, move the Run window so that it appears on the monitor that displays the menu bar.

PCI Network Installer: Read Me (7/96)

Article Created: 17 April 1996
Article Reviewed/Updated: 1 July 1996

TOPIC -----

This article contains the ReadMe file for the PCI Network Installer Version 1.0 which is used with the Apple PCI Token Ring card.

DISCUSSION -----

Contents

=====

- What the PCI Network Installer disk includes
- System requirements
- Installing software using the PCI Network Installer
- Important information about your Apple PCI Token Ring Card and software
 - Setting the ring speed
 - Using the Apple PCI Token Ring Card with MacIPX
 - Using the Apple PCI Token Ring Card with Novell Netware for Macintosh 3.011, 3.12 or 4.02
 - Using the Apple PCI Token Ring Card with SoftWindows
 - Using the Apple PCI Token Ring Card on Power Macintosh 7200/75 and 7200/90 systems
 - Using the Apple PCI Token Ring Card with the Apple Internet Router
 - Using the Apple PCI Token Ring Card with Apple LocalTalk/LaserWriter Bridge software
 - Using the Apple PCI Token Ring Card with SNA•ps
 - Locally Administered Addresses
 - Using the Apple PCI Token Ring Card with long station cables

What the PCI Network Installer disk includes

=====

Version 1.0 of the PCI Network Installer disk includes:

- Apple PCI Token Ring 1.0

The Apple PCI Token Ring card is the first, and at the time of this release, the only, PCI-based networking card for MacOS supported by Apple, and therefore the only card supported by this PCI Network Installer disk. Future releases of the PCI Network Installer may include support for additional PCI-based networking cards, as well as possible enhancements to the Apple PCI Token Ring driver.

System requirements

=====

The PCI Network Installer 1.0 disk requires:

- Power Macintosh 7200/120 computer
 - Power Macintosh 5400 Performa computers
 - Power Macintosh 7500, 7600, 8500, and 9500 series computers
 - Workgroup Server 7250, and 8550 computers
- NOTE: At this time, the PCI Token Ring card is not compatible with the PCI DOS Compatibility card. Apple Engineering is investigating this issue.
- Mac OS version 7.5.3 or higher
 - Open Transport 1.1 or higher (included in MacOS version 7.5.3)
 - An Apple PCI Token Ring card

Important information about your PCI Token Ring Card and software

=====

These notes pertain to the Apple PCI Token Ring driver, version 1.0, contained on this disk, and to the Apple PCI Token Ring card.

Setting the ring speed

The Apple PCI Token Ring card automatically detects the speed of the ring (4 Mbps or 16 Mbps) and adapts to it, eliminating the need for any manual speed-setting mechanism.

Except for the initial insertion (using a factory-preset speed of 16 Mbps), the card will "remember" the speed it used most recently and will make subsequent insertions using that speed. Should an insertion failure occur, however, the card will report this error to the user, and toggle the speed of the card for the next insertion attempt. In essence, after an insertion error occurs, the card will alternate between 4 Mbps and 16 Mbps with each insertion attempt until it finally succeeds.

The only caveat to this is the initial insertion using a factory-preset speed of 16 Mbps. The card's design requires that the first insertion cannot be onto an empty ring (one with no stations on it already), or the insertion will fail.

Using the PCI Token Ring Card with MacIPX

This release of the Apple Token Ring PCI card and software does not support MacIPX. This results from incompatibility issues between the MacIPX software and PCI-based networking cards in general, which Apple and Novell are working to resolve.

Using the Apple PCI Token Ring Card with Novell Netware for Macintosh 3.011, 3.12 or 4.02

Versions of the APPLETLK.NLM prior to version 4.50c have known problems with source routing, which may affect the proper operation of this card with your server. To avoid these problems, upgrade your APPLETLK.NLM to version 4.50c (or later), following the installation instructions provided by Novell.

This upgrade is available on Novell's NetWire Web site (<http://www.novell.com/>) as a self-extracting archive titled ATK45C.EXE.

Using the Apple PCI Token Ring Card with SoftWindows

The Apple PCI Token Ring software supplied on this disk does not support Insignia Solutions' SoftWindows product.

Using the Apple PCI Token Ring Card on Power Macintosh 7200/75 and 7200/90 systems

The Apple PCI Token Ring Card is not supported on Power Macintosh 7200/75 and 7200/90 systems at this time. If you try to use this card in a Power Macintosh 7200/75 or 7200/90, the system may freeze.

Using the Apple PCI Token Ring Card with the Apple Internet Router

The Apple Internet Router is not compatible with Open Transport, and is therefore not compatible with the Apple PCI Token Ring card or driver.

Using the Apple PCI Token Ring Card with Apple LocalTalk/LaserWriter Bridge software

The Apple LocalTalk Bridge 2.0.1 and Apple LaserWriter Bridge 2.0.1 products are not Open Transport compatible, and are therefore not compatible with the Apple PCI Token Ring Card or driver. Enhancements or updates to these products may be made at a later date, along with other MacOS system enhancements.

Using the Apple PCI Token Ring Card with SNA•ps

The Apple PCI Token Ring Card is compatible with SNA•ps client software, although the current version of Open Transport does not support the use of SNA•ps gateway software using the Apple PCI Token Ring Card and driver.

Locally Administered Addresses

There is presently no Apple-provided mechanism for setting a Locally Administered Address of the Apple PCI Token Ring Card. The hardware address of the card can be displayed by selecting it in the AppleTalk Control Panel, and setting the User Mode to Advanced.

Using the Apple PCI Token Ring Card with long station cables

The Apple PCI Token Ring Card's ability to automatically sense the speed of the ring may be defeated on station cables that exceed the maximum lobe length allowed for your network. The maximum lobe length allowed for your token ring network depends on your network topology, but never exceeds 330 feet for 16Mbps networks, or 500 feet for 4Mbps networks.

If your station cable (lobe cable) is excessively long, and the card's "last known" speed (factory default of 16Mbps for new cards) does not match the speed of your token ring backbone, then the card may fail to detect the speed mismatch, resulting in a partially-inserted condition. The symptom of this situation includes no network activity to or from this station, and a solid green light on the back of the card.

The work-around to this problem is to use a short station cable to temporarily connect the Apple PCI Token Ring Card to a token ring network running at the desired ring speed. This will allow the card to set its default speed to the desired ring speed, causing subsequent insertion attempts to be made at the proper speed.

Once the default speed of the card has been changed to the proper speed, insertion attempts using longer station cables are more likely to succeed, though we cannot guarantee proper operation of the card on networks that violate token ring topology specifications.

Drive Setup: Issues Using Custom Icons On Partitions (5/96)

Revised: 5/6/96
Security: Everyone

Drive Setup: Issues Using Custom Icons On Partitions (5/96)

Article Created: 17 April 1996
Article Reviewed/Updated: 6 May 1996

TOPIC -----

I have a Power Macintosh 9500/132 computer on which I have partitioned my hard drive into 8 partitions with Apple's Drive Setup version 1.0.4. When I apply custom icons to each partition and restart my computer, a number of the icons revert to generic and other icons are linked together (that is, the icon on partition 1 now appears on partition 2 as well).

I reinitialized the hard drive, reset parameter RAM (PRAM), and "clean" installed the system software. I then restarted and set up custom icons. After setting the icons and restarting again, the computer displays the same symptoms. All other SCSI devices/peripherals are disconnected.

DISCUSSION -----

Symptom

When using Drive Setup, including the latest version (1.0.4), with multiple partitions and custom icons, the icons for one partition may either duplicate across partitions, disappear, or turn generic. This is a known issue with Drive Setup that has been escalated previously.

Issue

This issue is caused by the way the driver interacts with partitions that have the same creation date. Drive Setup is so fast and efficient, that it often will create partitions with exactly the same date and time.

Workarounds

1 - One workaround is to modify the creation date of the partitions so they are not the same using a third party drive utility to do the partitioning.

2 - The other workaround is to avoid using custom icons for partitions.

This issue has been reported to engineering and is known. There are plans for this issue to be resolved in a future version of the Drive Setup utility.

Apple Media Tool 2.0: Use Wave File for Ambient Sounds (4/96)

Revised: 4/17/96
Security: Everyone

Apple Media Tool 2.0: Use Wave File for Ambient Sounds (4/96)

=====

Article Created: 17 April 1996

TOPIC -----

In Apple Media Tool 2.0, ambient sounds don't seem to work with SND files; I get a "end of file -39" error. The sound itself is fine, and plays in other screens, and in the preview. If I substitute a WAVE sound, then it works fine.

DISCUSSION -----

Using SND files as ambient sounds in AMT 2.0 does not work correctly. Apple is testing and investigating this behavior. Until a fix is available, WAVE files should be used as ambient sounds.

Power Macintosh 8500: Video Output Distortion (4/96)

Revised: 4/26/96
Security: Everyone

Power Macintosh 8500: Video Output Distortion (4/96)

Article Created: 17 April 1996
Article Reviewed/Updated: 26 April 1996

TOPIC -----

I am using a Power Macintosh 8500 series computer to output video to a video display. Regardless whether I use NTSC or S-video, when an image with a very large area of black is displayed on the video monitor, the image is significantly distorted. The problem is most evident when displaying an all-black window with white borders. The display appears pincushioned, especially on the right hand side and is most severe where there is the most black displayed.

DISCUSSION -----

The distortion is most likely caused by the performance level of the display being used. If the black portion is moved, the distorted area will probably move with it. This is common for many consumer and middle-performance displays. High-performance displays would have little or no distortion of this type.

It's likely that the video signal from the computer is fine. To verify this, you can record the signal that causes the distortion on video tape. Then, play the video tape and record the signal using the video record feature in the computer. You could then view the captured video on the computer display to confirm that the distortion is not in the tape recorded signal.

If you can't capture the taped video signal using the computer, you should check the signal using a high performance display.

To reduce or eliminate this distortion, you can use shades of gray instead of large black and white areas. Or, use colors instead of black like fully saturated blue, red, or green in large areas.

You should also note that although this distortion would likely appear on home televisions as well, most people will likely not notice it because consumer television have overscan, which prevents you from seeing the edges of the video

signal.

System 7.5 Update 2.0: Pwr Mac 9500 & Sound & Monitors (4/96)

Revised: 4/17/96
Security: Everyone

System 7.5 Update 2.0: Pwr Mac 9500 & Sound & Monitors (4/96)

=====

Article Created: 17 April 1996

TOPIC -----

I recently installed System Update 2.0 on my Power Macintosh 9500. Now, in addition to the Monitors & Sound control panel, I also have the Sound and Monitors control panel. Why do I have all of these, and which ones should I use?

DISCUSSION -----

During installation of System 7.5 Update 2.0 on a Power Macintosh 9500 series computers, the old Sound and Monitors control panels are mistakenly not removed.

The presence of the older control panels won't disrupt the operating system, but you can remove them to avoid confusion.

However, you may want to consider that the Monitors & Sound control panel does not provide a way of recording system alert sounds. The SimpleSound application does this, but it is not included with System 7.5 Update 2.0. So, to record system alert sounds, you need to use the Sound control panel. With this in mind, you might want to leave the Sound control panel installed.

Open Transport 1.1, ISP Assigned Static IP Address, PPP (6/96)

Revised: 6/4/96
Security: Everyone

Open Transport 1.1, ISP Assigned Static IP Address, PPP (6/96)

=====

Article Created: 17 April 1996
Article Reviewed/Updated: 4 June 1996

TOPIC -----

If you have installed Open Transport on your Macintosh, and your ISP (Internet Service Provider) uses assigned static IP addressing, and you connect using PPP; you may have experienced the following:

- You are able to dial in. Your account and password go through, Free PPP seems to be functioning properly, but when you try using Telnet, Newswatcher, or another Internet application; you get an error something like "Unable to Open MacTCP's resolver. Domain names will not work."
- You tried to set everything up the way your ISP told you, but the Open Transport TCP/IP control panel will not let you set the Subnet mask or Router address fields when connecting with MacPPP and configuring Manually.

DISCUSSION -----

The steps below should work with FreePPP and MacPPP 2.14 or later when using static addressing with Open Transport. If you have another way to access the web, you will find instructions and pictures to help in your configurations at this URL:

<http://www.halcyon.com/podenski/static-IP.html>

How to set up a static IP with Open Transport and Free PPP

The key point in setting up a static IP address configuration with Open Transport is to place some of the IP information in the Config PPP settings.

These instructions assume you already know how to use the Config PPP control panel to some degree, and that you only need this tip for static IP addressing.

- 1) Open the Config PPP control panel and click the Config... button.

- 2) Choose Manual ISP (some versions may have Config instead) in the PPP Server Name pop-up menu.
- 3) Click IPCP Options...
- 4) Enter your assigned IP address number in the Local IP Address field.
- 5) Enter your Gateway IP address number in the Remote IP Address field. Click OK and exit the Config PPP control panel.
- 6) Open the TCP/IP control panel. Be sure you have chosen MacPPP in the Connect via pop-up window, and you have chosen Manually in the Configure pop-up window.
- 7) Enter your assigned IP address number in the IP Address field.
- 8) Enter your DNS (domain name server) IP address in the Name server address field.
- 9) In the "Implicit Search Path: Starting domain name:" field enter your domain, for example, your.domain.com and close the TCP/IP control panel.

PB 500 Series with PowerPC Upgrd: Corrupts DOS Floppies (6/96)

Revised: 6/18/96
Security: Everyone

PB 500 Series with PowerPC Upgrd: Corrupts DOS Floppies (6/96)

Article Created: 10 April 1996
Article Reviewed/Updated: 18 June 1996

TOPIC -----

I formatted a floppy disk as DOS format on my PowerBook 500 series computer with the Power PC (PPC) Upgrade. Other Macintosh computers can read the disk fine, but my Pentium-based computer cannot read the disk. Why not?

DISCUSSION -----

Resolution

This issue has been fixed with System 7.5.3 Revision 2. This software can be found on Apple Computer's online software update sites. If you do have not access to an online service please refer to Tech Information Library article, "Macintosh System 7.5.3 Revision 2: FAQ." If you do not have System 7.5.3 Revision 2, follow the workaround provided below.

Original Issue

If a floppy disk is formatted as DOS format on a PowerBook 500 series computer with the PPC Upgrade, DOS/Windows computers will not be able to recognize the disk. Other Macintosh computers, however, recognize the disk as a DOS disk.

If a floppy disk is formatted on a DOS/Windows computer and then inserted into a PowerBook 500 series computer with the PPC Upgrade, the PowerBook will recognize it as a DOS floppy. However, if the disk is then removed from the PowerBook and taken back to a DOS/Windows system, that disk will not be recognized by the DOS/Windows computer.

Explanation

There was an inadvertent change made to the floppy driver of the PowerPC-upgraded PowerBook 500 series computers. This change makes a DOS disk unreadable by DOS/Windows computers if the PowerPC-upgraded PowerBook 500 series

computer formats the disk or is the first Macintosh computer to read the disk after it has been formatted on a DOS/Windows computer.

Workaround

If you cannot immediately install, the System 7.5.3 Revision 2 there is a workaround. You need to either format the disk as DOS on a Mac other than the PowerBook 500 series computer with the PPC Upgrade or make sure a Mac other than the PowerBook 500 series computer with the PPC Upgrade is the first to read the disk after it has been formatted on a DOS/Windows system. After another Macintosh has read the disk and written the resource fork (which is necessary in order for the Macintosh file system to recognize the disk), all other Macintosh computers (including the PowerBook 500 series computer with the PPC Upgrade) and DOS/Windows systems should be able to read the disk.

DOS Compatibility Card: Don't Remove Joystick Card (4/96)

Revised: 4/18/96
Security: Everyone

DOS Compatibility Card: Don't Remove Joystick Card (4/96)

=====

Article Created: 18 April 1996

TOPIC -----

Can the Joystick port on the DOS Compatibility Card be removed from the computer since it is on a separate board?

DISCUSSION -----

The DOS Compatibility Card joystick port should not be removed. While the joystick card is a separate from the DOS Compatibility Card daughter board, the joystick card is how the DOS Compatibility Card accesses the PDS slot. The DOS Compatibility Card daughter board has a 26-pin ribbon cable connecting to the joystick card. If you remove the joystick card, the DOS Compatibility Card no longer functions, and a message appears on the screen with the message "The DOS Compatibility Card is not installed. Changes made will take effect when the card is installed."

PowerTalk: Alias of the Mailbox (4/96)

Revised: 4/18/96
Security: Everyone

PowerTalk: Alias of the Mailbox (4/96)

=====

Article Created: 18 April 1996

TOPIC -----

Why can't I make an alias of the PowerTalk Mailbox. The Finder simply deselects the mailbox when an attempting to make the alias.

DISCUSSION -----

This issue was addressed with System 7.5.3 and the System 7.5 Update 2.0. You can now select the PowerTalk mailbox and choose the Make Alias command from the File menu. The alias will be created on the desktop and will open the PowerTalk mailbox.

Open Transport: Network Printers Missing From Chooser (4/96)

Revised: 4/18/96
Security: Everyone

Open Transport: Network Printers Missing From Chooser (4/96)

=====

Article Created: 18 April 1996

TOPIC -----

I cannot get any printers to appear in the Chooser when I select the LaserWriter 8.3.2 driver.

I'm trying to see a TI Microlaser and I've also tried seeing a NEC SilentWriter. I have tried both of these printers on a LocalTalk connection to a Macintosh Quadra, with the LaserWriter 8.3.2 printer driver, and both printers worked fine. I'm using this same LocalTalk connection to a Power Macintosh 8500 running Open Transport.

DISCUSSION -----

This issue was addressed in Open Transport 1.0.8 and later. The issue was first addressed in AppleTalk version 60.0.8 (a component of Open Transport 1.0.8).

What happened was some AppleTalk packets from the client were being addressed to 'network id 0'. These packets were ignored by some laser printers on LocalTalk.

AppleShare: Some Information Not Found Error Message (11/96)

Revised: 11/19/96
Security: Everyone

AppleShare: Some Information Not Found Error Message (11/96)

=====

Article Created: 18 April 1996
Article Reviewed/Updated: 18 November 1996

TOPIC -----

When using AppleShare Admin or AppleShare file server, I get the message, "Some server information could not be found. Please quit and restart the file server or some information may be lost." This happens when opening groups or adding users to groups.

DISCUSSION -----

Follow the steps below

- 1) Quit AppleShare File Server, AppleShare Admin, and AppleShare Print Server.
- 2) Move the Users and Groups file from the Preferences folder to the root level of the system folder.
- 3) Restart the computer.
- 4) Run Disk First Aid.
- 5) Run AppleShare Admin
- 6) Enter all information (such as the AppleShare serial number and the server's name).

NOTE: The server name must be exactly the same or access privileges may be lost. Also, the name field is case sensitive.

The usable data from the Users and Groups Data file moved in Step 2 should be imported into a new Users and Groups file.

AppleShare 4.2.1: Read Me (4/96)

=====
Article Created: 19 April 1996
Article Reviewed/Updated: 30 April 1996

TOPIC -----

This article is the AppleShare 4.2.1 ReadMe file. A correction to the original ReadMe file was made to this Tech Info Library document.

DISCUSSION -----

AppleShare Read Me

This document provides important information about AppleShare version 4.2.1. Some of this information is not included in the AppleShare Administrator's Guide or in the Addendum to AppleShare Administrator's Guide. You may want to print this document and keep it with your guide.

CONTENTS

AppleShare Client for Windows
Share the Workstation Software 3.6.2 folder
Upgrade to AppleShare Workstation 3.6.2
Upgrade workstations to System 7.5 Update 2.0
Sharing a volume over 2 gigabytes
Negative file sizes
The Print Server program uses LaserWriter 7 drivers
Longer print time when printing through a print spooler
Don't use QuickDraw GX with the Print Server program
Using the LaserWriter Bridge software
Use QuickTime 2.0 or later on workstations
Opening applications over the network
Delayed response to the Cancel button
Mounting the same volume twice in different zones
Using System 7 disk cache with AppleShare
Do not use virtual memory with AppleShare
Do not turn on file sharing from the Automated Tasks submenu

- Choose screen savers carefully
- Choose disk compression utilities carefully
- Using Retrospect Remote with AppleShare
- Using WebSTAR and AppleShare on the same server
- Logging on to an AppleShare file server from a PhoneNet PC client
- Using Farallon Ethernet Cards and multihoming
- Incompatibility with Atto NuBus card
- Using special characters in server names
- Use separate aliases for shared items
- Serial numbers are not updated immediately
- Working with a large Users & Groups Data File
- Use AppleShare Admin to modify Users and Groups information
- Avoid giving users access to the root of a volume
- Initializing floppy disks on an AppleShare file server
- Don't select Folder Protection
- General Controls control panel updated
- Don't install SAM Intercept on the server machine

AppleShare Client for Windows

AppleShare 4.2.1 includes a site license for AppleShare Client for Windows version 1.0.2. This product includes disc images of installation software and LaserWriter drivers on the AppleShare CD-ROM disc; the product also includes the printed guide Getting Started With AppleShare Client for Windows. You can create AppleShare Client for Windows floppy disks using the Disk Copy utility. The disk images, Disk Copy, and instructions on how to use this utility can be found in the AppleShare Windows Client 1.0.2 folder. For late-breaking information about AppleShare Client for Windows, see the README.TXT file on AppleShare Client for Windows Disk 1.

Share the Workstation Software 3.6.2 folder

If you use the Easy Install method when you install your AppleShare server software or if you use the Custom method and select the AppleShare Workstation Network Install option, the Installer places a folder named Workstation Software 3.6.2 at the root of your startup volume. This folder contains all the components needed to upgrade any Macintosh computer to the latest version of the AppleShare Workstation program. Share this folder and its contents to make the workstation program available on the file server for installation over the network.

See the AppleShare Administrator's Guide for instructions on how to share a folder. The Workstation Software 3.6.2 folder should have See Files and See Folders privileges enabled for Everyone (do not allow Make Changes privileges). Do not allow the folder to be moved, renamed, or deleted. Change all the enclosed folders as well. Enable guest access to your server so that users can log on as guests and so that they can mount the Workstation Software 3.6.2 folder as a volume on their desktops.

You may also want to rearrange the folder so that only the Workstation User's Guide and the Installer application are visible when the volume is mounted. This will eliminate any confusion about how to use the contents of the folder.

Upgrade to AppleShare Workstation 3.6.2

Macintosh system software includes AppleShare Workstation software, which users can use to log on to any AppleShare server, including an AppleShare 4.2.1 server. However, the AppleShare Workstation software supplied with system software does not provide the increased performance of AppleShare Workstation 3.6.2 and may not accept the full range of server greeting messages that can be sent from an AppleShare 4.2.1 server; users may experience other problems with earlier versions of the Workstation Software. For these reasons, it is important to encourage all users to upgrade to AppleShare Workstation 3.6.2, following the complete instructions provided in the online Workstation User's Guide. The guide is in the Workstation Software 3.6.2 folder, which is located on the startup volume of your server or on the AppleShare CD-ROM disc.

Upgrade workstations to System 7.5 Update 2.0

The Macintosh System 7.5 Update 2.0 Installer is on the AppleShare CD-ROM disc. You can use this Installer (or make it available over the network) to upgrade the systems of the workstations on your network. System 7.5 Update 2.0 is a set of system software enhancements that improves the reliability and performance of all computers running system software version 7.5, 7.5.1, or 7.5.2. You can install the update even if you (or users on your network) did not install Macintosh System 7.5 Update 1.0.

Note: Although Apple recommends that you install the update for the many enhancements it provides, be aware that once you install the update your users may notice a decrease in AppleShare performance. This decrease in AppleShare performance will be corrected in future releases of system software.

Sharing a volume over 2 gigabytes

AppleShare 4.2 allows you to share a volume as large as 4 gigabytes (GB). However, when a user mounts a volume that's over 2 GB, the information that is displayed at the top of the volume window on the user's computer will be inaccurate. The line beneath the volume window title displays the number of items in the window ("n items"), the amount of memory used by items on the volume ("n MB in disk"), and the amount of additional memory that can be used ("n MB available"). The "n MB in disk" and "n MB available" figures will not reflect the total volume size.

Negative file sizes

In some views, the Finder displays the size of a file next to the file's name. If users report that the Finder is displaying negative file sizes for files stored on AppleShare servers, instruct them to upgrade to System 7.5.1 or higher.

IMPORTANT:

In the original ReadMe document this section instructed users to upgrade to AppleShare Workstation 3.6.2. However, they should upgrade their system software, not their AppleShare Workstation software.

The Print Server program uses LaserWriter 7 drivers

The AppleShare Print Server program can accommodate any model of Apple LaserWriter that is compatible with LaserWriter 7 drivers, ImageWriter printers, and any other printers compatible with the print drivers for these two classes of printers. The Print Server program is dependent on LaserWriter 7 drivers and does not utilize LaserWriter 8 drivers. Client computers can have LaserWriter 8 drivers installed and use the print server; however, users will not get the functionality of LaserWriter 8 drivers (such as Automatic Setup) and server problems may occur. For instance, if client computers on your network have LaserWriter 8 drivers installed, print queue windows displayed on the server will display double entries for each print job.

Longer print time when printing through a print spooler

The total elapsed time is longer when users print documents through a print spooler rather than printing directly to a printer.

Don't use QuickDraw GX with the Print Server program

QuickDraw GX and AppleShare Print Server program are not compatible. Do not run them on the same machine.

Using the LaserWriter Bridge software

The LaserWriter Bridge software that is included on the AppleShare CD-ROM disc is intended for classic AppleTalk-based machines only; the LaserWriter Bridge software is not compatible with Open Transport-based machines.

Use QuickTime 2.0 or later on workstations

Workstations running both NOW utilities and QuickTime version 1.6 may hang when users log on to an AppleShare file server. To avoid this problem, instruct users to install QuickTime version 2.0 or later on their computers. Alternatively, removing QuickTime 1.6 or NOW utilities will fix the problem. Users may also experience problems with the HAM (Hierarchical Menu) utility. Solving this problem requires removing the utility.

QuickTime 2.1 is in the Extras folder, which is in the AppleShare Workstation 3.6.2 folder on the AppleShare CD-ROM disc. If AppleShare 4.2.1 has been preinstalled on your server, the Workstation Software 3.6.2 folder will be located at the root of the startup volume on your server. You can also find it on the AppleShare CD-ROM disc.

Opening applications over the network

If users with 68040-based Macintosh computers running system software prior to version 7.5 are experiencing problems opening applications over the network, they need to install Network Launch Fix into the Extensions folder of the System Folder on their computer startup disk. (Computers running system software 7.5 or later have Network Launch Fix built into the system.)

Network Launch Fix is in the Extras folder, which is in the AppleShare

Workstation 3.6.2 folder at the root of the startup volume on your server. You can also find it on the AppleShare CD-ROM disc.

Delayed response to the Cancel button

When users click the Cancel button to stop a file transfer that is in progress, the Finder may not respond immediately. The delay may be significant depending on the length of the round trip between the workstation and the server. Connections over multiple routers or over phone lines using Apple Remote Access may cause significant round-trip delays.

Tell users that if the Finder does not respond immediately, they should not assume that their computer has crashed or is frozen; they should wait several minutes before restarting.

Mounting the same volume twice in different zones

If you have enabled multihoming on your network, tell users to be cautious when connecting to volumes and servers with the same name in different zones; the volumes may actually represent the same volume on your server that can be accessed in several zones. If you log on to the same server in two zones and you attempt to copy the same files or folders from one icon representing a volume on the server to another icon representing the same volume, data loss will occur.

Using System 7 disk cache with AppleShare

In addition to the caching provided in AppleShare 4.2.1, your system software also provides disk caching. Depending on how you use AppleShare, you may notice an improvement in performance by adjusting the server computer's disk cache size. In general, increasing the size of the cache for your AppleShare file server will provide a more substantial performance improvement than increasing the size of the system software's disk cache.

Your server's system software ships with disk cache turned on and set to 96K. You may wish to experiment with different settings. (You adjust the cache size in the Memory control panel.)

If you change the size of the disk cache, be sure to restart the server computer for the new size to take effect.

Do not use virtual memory with AppleShare

AppleShare 4.2.1 cannot run with virtual memory turned on. Do not turn on virtual memory with your server computer.

Do not turn on file sharing from the Automated Tasks submenu

Do not use the Start File Sharing and Stop File Sharing commands from the Automated Tasks submenu under the Apple menu.

Choose screen savers carefully

There are many screen savers on the market that can be used to prevent screen

burn-in on AppleShare servers. Some screen savers are quite elaborate and perform many complex calculations to draw a single picture on the screen. Since they require significant amounts of CPU time, the more complex screen savers will reduce the performance of your AppleShare server. Please choose the screen saver that interferes the least with your AppleShare server.

Some screen savers are not compatible with AppleShare 4.2.1 and can cause your server to crash or hang. Before purchasing or using a screen saver, check with the screen saver's manufacturer to determine if the screen saver will work properly with your server.

Choose disk compression utilities carefully

Most disk compression utilities are incompatible with AppleShare 4.2.1 and can cause your server to crash or hang. Before purchasing or using a disk compression utility, check with the utility's manufacturer to determine if the utility will work properly with your server.

Using Retrospect Remote with AppleShare

If you are backing up a large number of files, you may need to give Retrospect Remote more application memory. See the Retrospect Remote User's Guide for information on when to increase the size of your Retrospect Remote program.

Using WebSTAR and AppleShare on the same server

You may experience problems if you try to run WebSTAR and AppleShare on the same server and you are also using Open Transport. If you attempt to open WebSTAR when AppleShare is already running, your system may freeze. To avoid this problem, follow these steps:

- 1) Open the TCP/IP control panel.
- 2) Choose User Mode from the control panel's File menu and click the Advanced or the Administration button. Then click OK.
- 3) In the control panel, click the Options button.
- 4) In the TCP/IP Options dialog box, deselect (click to remove the "X") the "Load only when needed" option.
- 5) Click OK.
- 6) Restart your server computer.

Logging on to an AppleShare file server from a PhoneNet PC client

Using the AppleShare Admin program, you can force new AppleShare users to change their password the first time they log on to your server. If new users are experiencing problems logging on to an AppleShare file server with PhoneNet PC, try letting them keep their original passwords.

Using Farallon Ethernet cards and multihoming

If you are using a Farallon Ethernet card on your server and you enable multihoming, you must terminate the card. If the card is not properly terminated, your server may freeze or crash.

Incompatibility with Atto NuBus card

AppleShare 4.2.1 is not compatible with Atto Technology's Silicon Express IV NuBus FAST/WIDE SCSI-2 SCSI Card. This is because AppleShare requires a system based on SCSI Manager 4.3. The Atto card uses its own SCSI manager.

Using special characters in server names

The AppleShare Admin program will not allow the administrator to enter a server name that contains a "/" character. If you must have a "/" character in the name of your server, use the following workaround:

- 1) Shut down file service.
- 2) Quit AppleShare Admin.
- 3) Drag the Users & Groups Data File from the Preferences folder to the System Folder.
- 4) Using the Sharing Setup control panel, enter a new name in the Macintosh Name box.
- 5) Start AppleShare Admin.
- 6) Enter the appropriate information in the administrator information and serial number dialog box.
- 7) When the file server information dialog box appears, do not change the server name. Just enter the Admin Key and click OK.
- 8) Quit AppleShare Admin.
- 9) Drag the Users & Groups Data File from the System Folder to the Trash (it is no longer needed).

A new Users & Groups Data File has been created in the Preferences folder.

Use separate aliases for shared items

Aliases to shared folders can be created using the Finder on the AppleShare server computer. Those aliases can be shared with workstations by placing them in a shared folder. If a shared alias is accessed by a workstation, the alias may be modified in such a way that it is no longer usable by the Finder on the AppleShare server. This can only happen with shared-item aliases created on an AppleShare server.

To avoid this problem, use separate aliases for shared items. Create two aliases to the same shared item, using the Finder on the AppleShare server. Place one alias in a shared folder for use by workstations. Keep the other alias in a folder that is not shared with workstations.

Serial numbers are not updated immediately

Using the AppleShare Admin program, you can change serial numbers while file service is running. However, the old serial number will remain in effect until you shut down and restart file service.

Once you change to a new serial number, the old serial number will no longer be displayed in the Administrator Information and Serial Number dialog box (displayed by starting the AppleShare Admin program and choosing File Server Serial Number Preferences from the Server menu). To avoid confusion about which serial number is in use, restart file service immediately after changing the

serial number.

Working with a large Users & Groups Data File

The AppleShare Admin program is configured to work with a Users & Groups Data File that has a maximum of 2000 users. If you have a large user community, you may need to increase the capacity of AppleShare Admin by increasing the preferred memory size in the Admin Info window. (In the Finder, select the AppleShare Admin icon, then choose Get Info from the File menu.) AppleShare Admin needs a minimum memory of 400K. Increase Admin's preferred memory size by 100K for each additional 1000 users in your user community. For example, AppleShare Admin needs 500K of memory to handle 2900 users, but it needs 600K of memory to handle 3900 users.

Use AppleShare Admin to modify Users and Groups information

If you install AppleShare on a server that also supports Apple Remote Access, you can't use the Users and Groups file from Apple Remote Access. Instead, use the AppleShare Admin program to work with Users and Groups.

Avoid giving users access to the root of a volume

Using the AppleShare Admin program, you can give workstation users access to either the root of a volume or to specific shared items within that volume. To ensure the security of your file server, give workstation users access to shared items only.

Initializing floppy disks on an AppleShare file server

If you are experiencing problems initializing floppy disks on an AppleShare 4.2.1 server that has connected users, try removing the PC Exchange control panel from the Control Panels folder in the System Folder and then restarting.

Don't select Folder Protection

The General Controls control panel contains two checkboxes in the Folder Protection box: "Protect System Folder" and "Protect Applications folder." Because there is an incompatibility between this feature and AppleShare, make sure that no X's appear in these two checkboxes.

General Controls control panel updated

When you install AppleShare 4.2.1 software on servers running System 7.5.1, the General Controls control panel is replaced by General Controls version 7.5.6. This update fixes bugs that affect AppleShare operations.

Don't install SAM Intercept on the server machine

AppleShare 4.2.1 does not run with Symantec Antivirus for Macintosh (SAM) Intercept installed in your server's Extensions folder.

Open Transport: Network Time 2.0.1 Issue (4/96)

=====

Article Created: 19 April 1996

TOPIC -----

I'm having a problem with system hangs when using Network Time 2.0.1 and Open Transport or System Update 2.0. Is there a compatibility issue with Network Time and Open Transport?

DISCUSSION -----

Network Time and Open Transport are compatible. The compatibility problem is with the Auto Power On/Off control panel which was last shipped as part of System 7.5.

The solution is to disable the Auto Power On/Off control panel.

PowerBook 150: Can't Use Drive Setup (6/96)

Revised: 6/26/96
Security: Everyone

PowerBook 150: Can't Use Drive Setup (6/96)

Article Created: 19 April 1996
Article Reviewed/Updated: 26 June 1996

TOPIC -----

I just upgraded the 120 MB IDE hard drive in my PowerBook 150 to a 500 MB IDE hard drive. However, the PowerBook will not start up from the drive even after installing the correct system software. I tried reformatting the hard drive with Drive Setup and Internal HD Format but they do not work. What should I do?

DISCUSSION -----

The PowerBook 150 has a driver scheme that is different than most Macintosh computers. The hard disk driver is always taken from ROM and if there is a driver present on the hard disk, the computer usually will not start up from it.

The PowerBook 150 comes with a special utility, Internal HD Format, that will format hard drives for use with the PowerBook 150. However, Internal HD Format will not format a drive that already has a driver partition. If Internal HD Format is run on a drive that has a driver partition, it will generate the message "Internal HD Format will not run on this system. Please use HD SC Setup." This message is in error since neither Apple HD SC Setup or Drive Setup are compatible with the PowerBook 150.

So if possible, you should purchase the new hard drive as unformatted. Then you can use Internal HD Format to format the drive correctly. After the drive is formatted, you should be able to install system software and start up from the drive as normal.

If the new hard drive is pre-formatted (whether by Apple or a third-party utility), follow this procedure:

Step 1

With the new hard drive installed, startup from another startup device with a

System Folder such as a Disk Tools disk.

Step 2

While starting up, if you receive a message saying "This disk is unreadable by this Macintosh, do you wish to initialize it..", select Initialize.* The hard drive icon should appear on the desktop when the initialization process is done. This is sufficient to prepare the hard disk for use since the driver is in ROM. You do not need to use the Internal HD Format utility.

If the message "This disk is unreadable by this Macintosh, do you wish to initialize it.." does not appear and the hard drive icon shows up on the desktop, click on the icon to select it and then select Erase Disk... from the Special menu and initialize the disk. This is sufficient to prepare the hard disk for use since the driver is in ROM. You do not need to use the Internal HD Format utility.

Step 3

Now that the hard drive is initialized, you can install the system software by booting from the install disk or CD.

* Note: The PowerBook 150 comes with a special program called PowerBook 150 Backup to make the system software disk set. Make sure the system software disk set is created before installing a new hard drive. Instructions for using the PowerBook 150 Backup program are in the User's Guide.

MacTCP DNR: What is it? (5/96)

Revised: 5/14/96
Security: Everyone

MacTCP DNR: What is it? (5/96)

Article Created: 20 April 1996
Article Reviewed/Updated: 14 May 1996

TOPIC -----

After installing System 7.5 Update 2.0 on my Power Macintosh 8500, I noticed the file "MacTCP DNR" in the System Folder. I'm not sure whether it was there before. As I recall, MacTCP DNR was a preference file before installing System 7.5 Update 2.0. Now the icon is different, and the file type is listed as control panel. Double clicking on it says that it is used by MacTCP.

Do I need the MacTCP DNR file, and what does it do?

DISCUSSION -----

MacTCP DNR is a special file that contains resources for TCP applications written for System 6.0.x. It's placed at the root level of the System Folder because older applications expect it to be available there, like older System 6.0.x control panels.

The file type/creator may have changed to control panel to reflect it was a control panel under System 6.0.x. You should leave the file installed in the event you come across an older TCP application that requires it. If you do remove it, the MacTCP DNR file will be recreated automatically after you restart your computer.

TCP/IP Control Panel: Syntax of Hosts File (12/96)

Revised: 12/16/96
Security: Everyone

TCP/IP Control Panel: Syntax of Hosts File (12/96)

Article Created: 20 April 1996
Article Reviewed/Updated: 16 December 1996

TOPIC -----

Does Open Transport 1.1/TCP support a local HOSTS file?

DISCUSSION -----

Open Transport/TCP supports one or more HOSTS file, stored in the System Preferences folder, that may be used to supplement and/or customize the domain name resolver's initial cache of information. The selected file is opened and parsed when Open Transport/TCP is initialized. As with MacTCP, the supported HOSTS file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Supported features include blank lines, comments (indicated by a semicolon), and data entry. Comments may begin at any location in a line; they may follow data entry on the same line. A comment extends from the semicolon to the end of the line. Data entry must follow the format:

```
<domain-name> <rr> [<comment>]
```

where <domain-name> is an absolute or Fully Qualified Domain Name, and where

```
<rr> = [<ttd>] [<class>] <type> <rdata> OR [<class>] [<ttd>] <type> <rdata>
```

The only <class> currently supported is IN (Internet Domain); <ttd>, time to live, indicates the record's configured lifetime in seconds; and <type> can be A (host address), CNAME (canonical name of an alias), or NS (name server). If <ttd> is not present the entry is assumed to have an infinite lifetime; this may also be indicated by specifying a value of minus-one (-1). \$INCLUDE and \$ORIGIN are not supported.

Open Transport/TCP is more stringent regarding the content and format of the HOSTS file than was MacTCP, which permitted violation of the FQDN requirement

for <domain-name>. For instance, this format:

```
charlie                A            128.1.1.1
```

which was acceptable to the MacTCP DNR, is no longer permitted because of the use of domain search lists in Open Transport/TCP (charlie could potentially exist in any or all of the configured domains). To accomplish the same effect, use this format instead:

```
charlie                CNAME       myhost.mydomain.edu
myhost.mydomain.edu    A            128.1.1.1
```

This associates the local alias charlie with the fully qualified domain name myhost.mydomain.edu, and resolves it to the address 128.1.1.1. Use of local aliases is limited to CNAME entries; NS and A entries must use fully qualified domain names.

If a HOSTS file is used, every effort should be made to keep it as small as possible and to only include entries that will be accessed frequently. This reduces the total memory footprint required to cache the DNS information and minimizes the need to maintain and update the HOSTS files as system information changes over time.

In order to activate a HOSTS file, the Advanced or Administrator mode must be used to select the desired file. The text file must already exist; it could have been created with any text editor or word processor. The HOSTS file is tied to the selected configuration. An administrator might, for example, specify different HOSTS files for use when connecting via Ethernet to the campus LAN and when dialing-in from a remote location.

AppleShare Client for Win 1.0: NE2000 and NDIS Issue (4/96)

Revised: 4/20/96
Security: Everyone

AppleShare Client for Win 1.0: NE2000 and NDIS Issue (4/96)

=====

Article Created: 20 April 1996

TOPIC -----

This article describes an issue between the AppleShare Client for Windows 1.0 and some NE2000-compatible Ethernet cards.

DISCUSSION -----

After installing the AppleShare Client for Windows 1.0, the computer may lock up entering Windows under the following circumstances:

- The computer is running Windows for Workgroups
- The computer is using an NE2000-compatible Ethernet card
- The Ethernet network has an AppleTalk router
- Windows for Workgroups networking is using an NDIS3 (enhanced mode) drivers

Resolution

The AppleShare Client for Windows 1.0.2 or later resolves this issue.

To use the AppleShare Client for Windows 1.0, remove the enhanced mode NDIS driver in Windows for Workgroups by following these steps:

- 1) Open to the Network group in Program Manager
- 2) Open Network Setup
- 3) Click on the button labelled 'Drivers...'
- 4) Click on the button labelled 'Setup...'
- 5) For Driver Type, select 'Real Mode NDIS Driver'
- 6) Click 'OK'
- 7) Click 'Close'
- 8) Click 'OK'
- 9) Follow the rest of the prompts on the screen.

Macintosh Users Unable to See Volumes on Novell Server (4/96)

Revised: 4/20/96
Security: Everyone

Macintosh Users Unable to See Volumes on Novell Server (4/96)

Article Created: 20 April 1996

TOPIC -----

We have several Power Macintosh 7500/100 computers, and we're having a problem with the Macintosh computers seeing a newly attached 8 GB disk array on a Novell server. The Macintosh users could see the old disk configuration, however, now the new disk array is the only logical volume on the server.

The Macintosh users can see the Novell server in the Chooser, logon to the server, and print to spooled printers using AppleTalk. However, the newly attached disk array does not appear in the Chooser's volume selection dialog box -- nothing is presented in the selection dialog, not even a grayed volume name. PC users are able to mount this volume.

I'm considered the Macintosh administrator for this server, and I'm wondering if my problem could be with a Macintosh not being able to access volumes larger than 2 GB.

DISCUSSION -----

The AppleTalk portions of your Novell server are working because your Macintosh users can see the server in the Chooser, connect by logging on, and print to the server's attached printers using AppleTalk.

There is no way to correlate the disk array's volume size to your problem, because the Macintosh computers have not yet mounted the volume. This is because the Novell server is not informing the Macintosh computers that there are any volumes attached. The volume selection dialog lists volumes in response to an AFP request, from the Macintosh to the server, for a list of attached volumes, not caring about the characteristics of the volumes.

Therefore at this stage, this appears to be a configuration problem on the Novell server. Any volume size issues will only emerge once the Macintosh users select the disk array, and attempt to mount it. Furthermore, any difficulties that may arise, when mounting the disk array, are not related in any way to the

Macintosh computers inability to see volumes offered by the server.

You need to review the steps necessary to make the server's volumes available to Macintosh users. The multi-protocol Novell server needs each aspect of its services separately set up for each protocol supported -- a volume needs to be explicitly shared for IPX clients, AppleTalk clients, and IP clients.

AppleVision 1710: Front Controls used for DOS/Windows (4/96)

=====

Article Created: 22 April 1996

TOPIC -----

I have an AppleVision 1710 Display and the five front left controls only open the AppleVision Setup window.

DISCUSSION -----

The front controls on the AppleVision 1710 Display are for changing or selecting options and values for your monitor. However, the control buttons on the far left of the display are for use only with DOS/Windows computers. The two left buttons are for selecting on-screen menus; the middle button is for selecting a topic on a menu; and the two right buttons are for adjusting values up or down.

If you do not install the AppleVision software, you can use these buttons to manually adjust the monitor.

Security: Everyone

Connecting to DEC LAT network

=====

Article Created: 22 April 1996

TOPIC -----

Is there a solution for running LAT on a Power Book 5300 with System 7.5.3 and Open Transport 1.1 to a VAX running AppleTalk for VMS? I found a copy of the LAT tool on the VAX, but it froze the Power Book immediately under System 7.5.2 with classic networking.

DISCUSSION -----

The LAT Tool version 1.3.2 is the most current. There were some problems with version 1.3.1 hanging systems. We have found version 1.3.2 to be quite stable. You can contact Digital's CSC for the latest LAT tool.

Connecting PC-Compatibles to AppleTalk Networks (4/96)

=====

Article Created: 22 April 1996
Article Reviewed/Updated: 25 April 1996

TOPIC -----

I would like to connect my PC-compatible computers to my AppleTalk network. What products are available for Windows 3.1x and Windows 95?

DISCUSSION -----

- 1) AppleShare Client for Windows by Apple Computer, Inc. which runs on Windows 3.1x. Lets PC-compatible computers connect to LocalTalk, Ethernet, or Token Ring networks. Provides client for accessing AppleTalk file and printer services.
- 2) Personal MacLAN Connect by Miramar Systems. Runs on Windows 3.1x and Windows 95. Lets PC-compatible computers connect to LocalTalk, Ethernet, or Token Ring networks. Provides full peer to peer file and printer sharing between Macintosh and Windows PCs.
- 3) COPSTalk for Windows by COPS, Inc. Runs on Windows 3.x and Windows 95. Lets PC-compatible computers connect to LocalTalk or Ethernet networks. Provides client for accessing AppleTalk file and printer services.

Apple Monitors: Using on PC-Compatible

Article ID: 19653
Created: 4/22/96
Modified: 1/12/00

TOPIC

Which Apple monitors can I connect to a PC-compatible computer?

DISCUSSION

The Apple Multiple Scan series of monitors may be connected to either a Macintosh computer or a PC-compatible computer. However, not all Multiple Scan monitors include the required PC adapter. The following tables show which monitors include a PC adapter and which ones do not.

Monitors that come with a PC adapter:

- Multiple Scan 720 (922-1458, Adapter, Macintosh to VGA)
- Multiple Scan 17 (922-0736, Cable, Mac/PC Adapter)
- Multiple Scan 1705 (922-1458, Adapter, Macintosh to VGA)
- Multiple Scan 1710 (922-1458, Adapter, Macintosh to VGA)
- Multiple Scan 20 (922-0736, Cable, Mac/PC Adapter)

Monitors that do not come with a PC adapter:

- Multiple Scan 14 (needs 922-0736, Cable, Mac/PC Adapter)
- Multiple Scan 15 (needs 922-0736, Cable, Mac/PC Adapter)
- Multiple Scan 15AV (needs 922-1458, Adapter, Macintosh to VGA)

AppleVision 1710 Display: Convergence Discussion (4/96)

Revised: 4/23/96
Security: Everyone

AppleVision 1710 Display: Convergence Discussion (4/96)

=====

Article Created: 22 April 1996

TOPIC -----

My AppleVision 1710 Display manual mentions that I can change convergence in the AppleVision Setup software. What is convergence and how does it affect the picture being displayed on the screen?

DISCUSSION -----

Red, green, and blue signals in your display intersect, or converge, to create the colors you see on the screen. If convergence is not adjusted properly, the images or text on your screen may be blurred, or you may get a rainbow effect with several colors visible at the edges of the images on the screen. Over time, your display may be exposed to external magnetic fields, which may cause the color signals to converge less precisely, producing a less distinct image. You may adjust convergence to correct for a blurred image or to suit your personal preferences.

Before making adjustments to the convergence, first make sure the settings for height/width, position, pincushion, and rotation are correct.

You can click the convergence icon shown in the Geometry window to open the Convergence Control panel. When you do this, the screen background changes to a grid composed of red, green, and blue lines. First adjust the horizontal lines with the up and down arrows, and then adjust the vertical lines with the left and right arrows. When convergence is set properly, the lines are aligned vertically and horizontally. Click OK to save the setting.

IMPORTANT: Because of the slight curvature of the front glass and the central location of the RGB gun within the CRT assembly, convergence settings may appear correct at the center of the display but slightly off at the outer edges. Therefore, when you adjust convergence, adjust for the best overall color clarity.

NOTE: When Overscan is on, you cannot make changes to any of the Geometry

selections, and the menu buttons and titles are dimmed. Turn Overscan off to make changes.

Remote Access Control Panel Requires Password (10/96)

Revised: 10/16/96
Security: Everyone

Remote Access Control Panel Requires Password (10/96)

=====

Article Created: 16 October 1996

TOPIC -----

I have an Apple Remote Access (ARA) Personal Server on my network. In the Remote Access Setup control panel, when selecting the Answer calls checkbox, I get a dialog with the message "A password is required to set answering on this network", and a field for the password. I entered my personal password, but it was not accepted. What is wrong?

DISCUSSION -----

AppleTalk networks have the ability to lock out remote access including ARA. The network administrator enables or disables this feature with the Security Zone feature. You have to obtain a password from your Network administrator.

The Security Zone feature prevents the unauthorized remote access of an AppleTalk network.

AppleShare: Move File to Different Folder, Creates Copy (4/96)

=====

Article Created: 22 April 1996
Article Reviewed/Updated: 25 April 1996

TOPIC -----

With AppleShare 4.1 on a Workgroup Server 8150/110, when I logon as a user, a file is copied when moved between two folders on the same volume. When I logon as the administrator, or in front of the server computer, the file is moved, not copied.

DISCUSSION -----

This happens because as a user, you do not have access privileges necessary to move the file. You can do one of the following:

- Place the folders inside a single shared folder the user has See Folders, See Files, and Make Changes privileges. You should now be able to move the file rather than copy it.
- Give the user Make Changes privileges to the volume, or to additional folders.

After System 7.5 Update 2.0 Install, Can't Open Chooser (4/96)

Revised: 4/25/96
Security: Everyone

After System 7.5 Update 2.0 Install, Can't Open Chooser (4/96)

=====

Article Created: 22 April 1996

TOPIC -----

After installing System 7.5 Update 2.0, when I try to open the Chooser or the AppleTalk control panel I get an error message that says AppleTalk Cannot Be Opened. What is causing this?

DISCUSSION -----

The resource for AppleTalk services are contained within the Shared Library Manager files, located in the Extensions folder of the System Folder. For AppleTalk services to function properly, both the Shared Library Manager and Shared Library Manager PPC files must be present.

To install the Shared Library Manager files for your Power Macintosh computer, double click the System 7.5 Update 2.0 Installer and choose the custom install in the pop-up menu. In the custom install menu list, click on the arrow to the left of the following:

Networking Software
Open Transport 1.1
Open Transport For PowerPC Only

Select Apple Shared Library Manager for PowerPC Macintosh by clicking the checkbox to the left, then click Install.

Microsoft Office & Global Village 2.5.x Incompatibility (4/96)

=====

Article Created: 22 April 1996

TOPIC -----

There is a known incompatibility with the Global Village fax software and Microsoft Office. When trying to launch Microsoft Office while the Global Village software is installed, in certain situations the computer will either freeze, or the application will open and then immediately close.

DISCUSSION -----

If a user is running Global Village software from v2.5 to v2.5.5, you need to acquire the Global Village v2.5.6 update, and Microsoft Office patch.

The Global Village software is available from the following internet sites:

- <http://www.globalvillage.com/support/tupdate.html>
- [ftp.globalvillage.com/pub/software/mac/](ftp://globalvillage.com/pub/software/mac/)
- Through most major online services

For the Microsoft Office update, you must contact Microsoft.

SerialDMA Extension: Use it instead of ASFU Fixer (12/96)

Revised: 12/3/96
Security: Everyone

SerialDMA Extension: Use it instead of ASFU Fixer (12/96)

=====

Article Created: 25 April 1996
Article Reviewed/Updated: 3 December 1996

TOPIC -----

The ASFU Fixer extension from GDT Softworks should be replaced with Apple's SerialDMA extension.

DISCUSSION -----

The ASFU Fixer was installed on early Power Macintosh computer, such as the Power Macintosh 7100 and 8100, to allow certain serial communication connections. However, if this extension is installed, it breaks serial communications between the Macintosh and several Apple MessagePad applications and tools such as the Newton Connection Kit, Newton Toolkit, Newton Press, and Newton Package Installer. It may also affect Newton Backup.

If you have ASFU Fixer installed, you should remove it and use Apple's SerialDMA extension instead.

Hebrew and Arabic Language Kits: System 7.5 Update 2.0 (4/96)

=====

Article Created: 25 April 1996

TOPIC -----

The Read Me file for the Hebrew and Arabic Language Kits does not mention System 7.5 Update 2.0. Is it supported with these Language Kits?

Also, I noticed that the ReadMe states that LaserWriter 8.3 and StyleWriter 1200 drivers will be installed if they are not already present. If I have System 7.5 Update 2.0 installed, and then install the Language Kits, will I have older versions of the LaserWriter 8 and StyleWriter 1200 printer drivers?

DISCUSSION -----

System 7.5 Update 2.0 is supported with the Language Kits. If System 7.5 Update 2.0 is installed, and then the Hebrew or Arabic Language Kit is installed, you will still have LaserWriter 8 version 8.3.3 and StyleWriter 1200 version 2.1.1, which are installed by System 7.5 Update 2.0.

Arabic and Hebrew Language Kits: What's in Version 1.0.1? (8/96)

=====

Article Created: 25 April 1996
Article Reviewed/Updated: 9 August 1996

TOPIC -----

What is the difference between version 1.0 and version 1.0.1 of the Arabic Language Kit and Hebrew Language Kit?

DISCUSSION -----

The only change to version 1.0.1 of Arabic Language Kit and Hebrew Language Kit is to include the latest version of WorldScript, version 1.1.

The version of WorldScript included with version 1.0 of these kits may cause a crash when used with Macintosh Performa 475, 476, 575, 577, 578 and Macintosh LC 475 and 575 computers. Additionally, when using the Hebrew Language Kit on other 68LC040-based computers, such as the PowerBook 280 and 280c, the computer may lock up when you switch to the U.S. Keyboard Layout after typing in Hebrew in SimpleText Hebrew or at the Finder.

If you are using version 1.0 of the Arabic or Hebrew Language Kits, you should install the WorldScript Updater v1.1, which is available on the online services.

Apple Media Tool 2.0: How to Create Flipbooks (4/96)

Revised: 4/26/96
Security: Everyone

Apple Media Tool 2.0: How to Create Flipbooks (4/96)

=====

Article Created: 26 April 1996

TOPIC -----

This article contains directions for creating flipbooks in Apple Media Tool 2.0.

DISCUSSION -----

Here is a list of essential steps for quickly creating Flipbooks. A list of example files on the Apple Media Tool 2.0 CD that demonstrate how Flipbooks should work.

BEFORE YOU START
=====

You need a Flipbook media item. Flipbook media items are pictures whose contents have been divided into equal-sized areas, known as frames. The frames can be arranged in one or more rows, but all rows must be the same height. Each row can be divided into multiple columns, all of which must be the same width.

HOW TO SET IT UP
=====

Step 1

Open your project and add your Flipbook media item to the media list.

Step 2

Click and hold on the Flipbook media item until a pop-up menu appears.

Step 3

Choose "Flipbook" from the pop-up menu.

Step 4

Double-click on the Flipbook media item in the media list to display its parameters.

Step 5

Set the number of frames, columns, and rows by adjusting the values in the appropriate fields.

Step 6

Set the column width and row height by adjusting the values in the appropriate fields. Click "OK" when finished.

Note:

You will need these values again later.

Step 7

Add your Flipbook media item to a screen.

Step 8

Double-click the Flipbook object in the object list to display its parameters.

Step 9

Set the column width and row height by adjusting the values in the appropriate fields. Use the same values specified earlier.

Step 10

Specify the rhythm of the Flipbook.

It's important to note that changing the rhythm of a Flipbook changes the way that Apple Media Tool counts the frame numbers for that Flipbook.

If a rhythm of two is specified, each frame is displayed twice. As a result, the first two frames displayed are the same image. The next two frames displayed are the next image, and so on. If a rhythm of ten is specified, the frames 0 to 9 display the first image from the Flipbook media object, frames 10 to 19 display the second image from the Flipbook media object, and so on.

If you want to tell Apple Media Tool to go to a specific frame, you need to adjust the frame number you specify by multiplying it by the rhythm. If you use a Flipbook media object with 3 frames, you would have the following results:

Begin_Table

+=====+			
Image in	Frame Numbers if	Frame Numbers if	Frame Numbers if
Flipbook	Rhythm = 1	Rhythm = 2	Rhythm = 10
+=====+			
1	0	0-1	0-9
2	1	2-3	10-19
3	2	4-5	20-29
+-----+			

End_Table

FINSIHING UP

=====

Add actions which control the Flipbook. Flipbook objects can perform the following commands:

- | | |
|------------------|-------------------|
| - Enable | - Start-Stop |
| - Enable-Disable | - Stop |
| - Disable | - Stop All |
| - Move By | - Go to Beginning |
| - Move To | - Go to End |
| - Start | - Go to Time |

EXAMPLES

=====

The Apple Media Tool 2.0 CD contains several files that demonstrate Flipbooks. Check these paths on the AMT 2.0 CD:

- An AMT project with Flipbooks:

```
Apple Media Tool
  New Features Demo Project
    New Features Demo
```

- Flipbook media objects:

```

LaserWriter 16/600 PS Fax: PS Code for Ignoring Dialtone (4/96)

Revised: 4/26/96
Security: Everyone

LaserWriter 16/600 PS Fax: PS Code for Ignoring Dialtone (4/96)

=====

Article Created: 26 April 1996

TOPIC -----

We use a Blinddial patch for the LaserWriter 16/600 PS fax, so that it can be used with a PBX without a standard dialtone. The patch implements a X3 command to the Modem. This patch stopped working with PCI-based Power Macintosh computers. Is there a new patch or another way to implement the X3 modem command?

DISCUSSION -----

We confirmed that the Ignore Dialtone patcher causes a System error on a Power Macintosh 9500 using System 7.5.3, but does work successfully on Power Macintosh 7200 and PowerBook 5300 using System 7.5.2 or 7.5.3.

When using the Ignore Dialtone patcher on a 9500 running 7.5.3, two error dialogs are displayed:

1. System Error -4099
2. Sorry, a system error occurred. "Ignore Dialtone error type 10"

then the 9500 froze.

System Error -4099 is a Print Manager error, and translated means "Write request too big." A type 10 error is a trap error.

We'll request the patcher be rewritten to work on PCI based Macintosh computers. Meanwhile, you can use another Macintosh to run the Ignore Dialtone patcher on, or alternatively download the following PostScript code with the Apple Printer Utility:

%=====

```

Apple Media Tool 2.0: How to Create an Idle Command (4/96)

Revised: 4/26/96
Security: Everyone

Apple Media Tool 2.0: How to Create an Idle Command (4/96)

=====

Article Created: 26 April 1996

TOPIC -----

In Apple Media Tool 1.x there was an Idle command that would cause the title to link back to a specific screen after a specified time of inactivity. This was useful for projects that played in kiosks. This article describes how to do this same thing with Apple Media Tool 2.0?

DISCUSSION -----

Here is one example of how you can achieve this same functionality in Apple Media Tool 2.0.

In this example, you are setting a duration for a background and for a text field (timeout.txt). These objects are the timers. The timeout.txt object is a text object that asks the user "Do you need more time? Click here to continue".

Note:

This article assumes you already know how to import media, create a screen, change actions, create commands, change commands, and other basic media tool procedures. If you do not know how to do this, please refer to the Apple Media Tool User's Manual.

Step 1 - Set Background Duration Time

Set a duration, in ticks*, for the background.

* 60 ticks = 1 second

The duration should be fairly long. When the duration elapses, the assumption is your audience has lost interest or walked away from the kiosk.

Step 2 - Assign Commands for the Background

Here is a chart of the event/action for the background.

Begin_Table

Background Object	Events	Actions
	After Display	Start Itself
		Go To Beginning Itself
	Finished	Show Timeout.txt
		Start Timeout.txt

End_Table

Step 3 - Set Timeout.txt Duration Time

Set a duration, in ticks*, for the background.

* 60 ticks = 1 second

Step 4 - Assign Commands for Timeout.txt

Here is a chart of the event/action for Timeout.txt

Begin_Table

Timeout.txt Object	Events	Actions
	Before Display	Hide Itself
		Hide Itself
		Stop Itself
	Mouse Up	Go To Beginning Itself
		Start Background
	Finished	Go To XXX (screen preferred)

End_Table

If timeout.txt finishes, meaning nobody clicked to continue, then it links back

to the main screen, or wherever you want.

AppleVision 1710 Display: Color Window Terms (4/96)

Revised: 4/27/96
Security: Everyone

AppleVision 1710 Display: Color Window Terms (4/96)

=====

Article Created: 26 April 1996

TOPIC -----

Please define the terms used in the Color window of AppleVision Setup for the AppleVision 1710 and 1710 AV Displays.

DISCUSSION -----

Following are definitions of terms found in the Color window of AppleVision Setup:

White Point

All light, including display light, has a white point, which is the measure of the color content of the light. The white point is also referred to as the color temperature measured in degrees Kelvin - a temperature scale used in scientific applications. Standard white points are available by selecting a corresponding button from the default list available in the White Point panel within the Accurate Color settings. D50 or 5000 degrees Kelvin, is a common lighting setting used in graphic arts. 6500 + 8 MPCD (mean perceptible color difference) or D65 is the white point of Midday sun. The default white point is 9300 + 8 MPCD which is the standard setting for Macintosh displays and high-definition television. This is a high-intensity white point, located at the blue end of the color spectrum. The lower the intensity, the closer it moves to the red end of the spectrum. If you are working in a darkroom environment, you should choose the lowest standard setting, which is D50. Other common settings not available by selecting a button are: D40 or 4100 degrees Kelvin for halogen light and D33 or 3300 degrees Kelvin for flourescent light. Please note that the AppleVision 1710 Display does not support color temperatures below 4100 degrees Kelvin.

If you wish to create a custom white point, click the Create Custom White Point button. When you do this, the Custom White Point dialog box appears on the screen. You create a custom white point in one of three ways. If you select Kelvin, the numeric feedback panel with slider and detente white points appears to the right of the button. You can then create a white point based on a Kelvin

temperature between 4100 and 9300 degrees by moving the slider. Lower temperatures create reddish whites and higher temperatures create bluish whites. If you select the button xy (1931 CIE), or u'v' (1976 CIE), the respective windows contain a color space graphic, a cross hair cursor that you can drag, and two fields of coordinates that you can edit. By the dragging the cross hair, you can set the desired white point value.

Gamma Curve

The gamma curve is the relationship between color intensity (chromaticity) and light (luminance) and determines the degree of gamma correction for the display. With a low gamma curve, colors are washed out. With a high gamma curve, colors have more contrast. The human eye can determine subtle changes in color, but does not register these changes in a linear way. Color systems are linear and continuous. A linear gamma curve ensures that the display produces the correct luminance levels on each primary color channel, and matches the user's nonlinear color expectations to the display's linear color devices. Gamma correction is a technique that adjusts the gamma curve to compensate for the loss of detail in dark objects. The default gamma value for the AppleVision 1710 Display is 1.8.

You can adjust the gamma curve on your AppleVision 1710 Display to ensure that the light and dark detail on images that you import or export is consistent. Most scanners have a gamma value of 1.0, while video editing equipment use a gamma value of 2.2. You can select a gamma value from the Gamma Curve panel in the Color window. When you do this, the gamma curve image in the panel changes to reflect the new value.

Ambient Light

Ambient light is the light surrounding the display. It can change the way colors appear on the screen. For example, fluorescent lights make colors look bluer, daylight or sunlight can make them look redder. To get a true color rendering, first set the white point for the display, and then correct for ambient light. Before you can correct for ambient light, you must also set the display color depth to millions. (To create a custom ambient light, use the ambient light tool supplied with the display and follow the instructions in chapter 4 of the user's guide.) The default ambient light setting is "None".

ColorSync System Profile

Macintosh computers use an additive system that combines red, green, and blue (RGB) phosphors to create display colors. They use a subtractive process of cyan, magenta, yellow, and black (CMYK) inks to create printer colors. Because these two processes are different, and because no two color devices produce exactly the same colors, AppleVision 1710 Displays, printers, scanners, and other color devices, must be characterized to provide the best color match. The software that does this is called ColorSync, and the AppleVision 1710 Display comes with a general profile called a ColorSync profile that characterizes the display. (For instructions on importing and exporting ColorSync profiles, follow the instructions in chapter 4 of the user's guide.)

When you reset the white point, gamma curve or ambient light, you will not see the change reflected on the screen or be able to export ColorSync system

profiles until you click the Recalibrate button located in the Color window.

Virtual Photometry Technology

The AppleVision display has the ability to correct for manufacturing variances through a process called Virtual Photometry Technology (VPT). Using VPT, the AppleVision display can be set to a wide variety of white points and can correct for CRT aging, and for ambient light conditions. VPT is a proprietary Apple technique used to calculate a theoretical white point. It does this by measuring the currents for the R, G, and B electron guns, while displaying a white screen. The current values are correlated to factory calibration data that is programmed into the display during production. An extremely accurate white point can be determined by compensating for the aging affects of the display. The current sensing circuitry also allows the host CPU to calculate the observed color of any pixel on the screen.

StyleWriter II: Special Communication Specifications (4/96)

Revised: 4/29/96
Security: Everyone

StyleWriter II: Special Communication Specifications (4/96)

=====

Article Created: 26 April 1996

TOPIC -----

I am trying to use a special device with the StyleWriter II printer. However, I need some information I couldn't find in the StyleWriter II printer manual. I need the data bits, stop bit, baud rate, and parity.

DISCUSSION -----

The information you need is listed in the table below. However, the StyleWriter II is a QuickDraw printer. Unlike many MS-DOS/Windows printers, QuickDraw printers require special drivers, and do not have a built-in character set or support emulation modes such as Epson, or Hewlett-Packard (HP).

In addition to the information in the table, you will need to write a custom QuickDraw driver if the StyleWriter II is used on any computer other than a Macintosh. Writing a custom driver is NOT an easy task, and requires knowledge of both programming and printer command sequences.

StyleWriter II Communication Specifications

=====

+=====+		
Data Type		Data Rate
+=====+		
Start Bits		1
+-----+		
Data Bits		8
+-----+		
Stop Bits		1
+-----+		
Baud Rate		57.6 Kilobit per seond (Default)

Hebrew & Arabic Language Kit: System Direction Issues (4/96)

Revised: 4/30/96
Security: Everyone

Hebrew & Arabic Language Kit: System Direction Issues (4/96)

=====

Article Created: 30 April 1996

TOPIC -----

This article contains the answers to questions about the System Direction in the Hebrew and Arabic Language Kits.

Questions in this Article:
=====

- 1) What does the System Direction setting in the Text control panel do?
- 2) I have the Hebrew (or Arabic) Language Kit installed and want to change the System Direction from left-to-right to right-to-left. How do I do this?
- 3) Is the System Direction information stored within individual documents?
- 4) Why do some localized version of SimpleText provide left or right text justification and others only provide right text justification?
- 5) After changing the System Direction to Right-to-left, SimpleText (or SimpleText Arabic, SimpleText Persian, or SimpleText Hebrew) still displays the text I enter from Left-to-right. Why?
- 6) Can I use both Left-to-right and Right-to-left text in the same document within SimpleText?
- 7) I installed the Hebrew (or Arabic) Language Kit, and wrote some letters with the System Direction set to Right-to-left. I then removed the Hebrew (Arabic) Language Kit and installed the Cyrillic Language Kit. When I try to type in SimpleText Russian, the text is from Right-to-left. Why is this happening? Does the Cyrillic Language Kit also support Right-to-left text?
- 8) I'm using ClarisWorks 4.0v2 and 4.0v4 and have the System Direction set to Right-to-left. All of the menus are displayed from Right-to-left as they should be, but I can't type in ClarisWorks from Right-to-left--all the text I enter is

always Left-to-right. Does ClarisWorks support WorldScript I? Is there any information about WorldScript in ClarisWorks Help?

9) I'm using ClarisWorks 4.0v4, and the names of some of the options in the File, Format & other menus begin and/or end with an unusual character. What is this?

DISCUSSION -----

1) Question: What does the System Direction setting in the Text control panel do?

Answer: The System Direction setting in the Text control panel determines the writing direction of text in menus and dialogs (elements created by the System).

In many instances, changing the System Direction also affects the justification of text within a SimpleText document. SimpleText is considered a "world-ready" application, and it takes its queue for text justification from the System Direction setting. The implementation of using the System Direction to control text justification in SimpleText is an undocumented feature.

Therefore, if the System Direction is left-to-right, then text within a SimpleText document is left-justified. If the System Direction is right-to-left, then text within a SimpleText document is right-justified.

2) Question: I have the Hebrew (or Arabic) Language Kit installed and want to change the System Direction from left-to-right to right-to-left. How do I do this?

Answer: Use the Text control panel to change the System Direction.

3) Question: Is the System Direction information stored within individual documents?

Answer: The System Direction is stored in the System file, not within individual documents.

4) Question: Why do some localized versions of SimpleText provide left- or right-justification and others only provide right text justification?

Answer:

Certain localized versions of SimpleText, such as SimpleText Persian, SimpleText Arabic, and SimpleText Hebrew, override the System Direction feature, and always display text as right-justified because it is more appropriate for those languages.

5) Question: After changing the System Direction to right-to-left, SimpleText (or SimpleText Arabic, SimpleText Persian, or SimpleText Hebrew) still displays

the text I enter from left-to-right. Why?

Answer: Any applications running when the System Direction is changed are not affected. You'll need to quit and re-open these applications to see the System Direction change.

6) Question: Can I use both left-to-right and right-to-left text in the same document within SimpleText?

Answer: No, you cannot use both System Directions in the same SimpleText document. For example: if you set the System Direction to right-to-left, open SimpleText, and type several lines, the text appears right-justified. If you then save your document, quit SimpleText and change the System Direction to left-to-right, when you re-open your original document all the text will now be left-justified.

7) Question: I installed the Hebrew (or Arabic) Language Kit, and created a document with the System Direction set to right-to-left. I then removed the Hebrew (Arabic) Language Kit and installed the Cyrillic Language Kit. When I try to type in SimpleText Russian, the text is displayed from right-to-left. Why is this happening? Does the Cyrillic Language Kit also support right-to-left text?

Answer: This shouldn't happen because the Cyrillic Language Kit does not support right-to-left text; Apple is looking into this issue.

To avoid the issue, change the System Direction back to left-to-right before removing either the Hebrew or Arabic Language Kits.

To resolve the issue after it occurs, you'll need to re-install the Hebrew or Arabic Language Kit, change the System Direction to left-to-right, and then remove the Hebrew or Arabic Language Kit.

NOTE: Resetting the PRAM does not restore the System Direction. Also, you cannot Custom Install the Text control panel from the Arabic or Hebrew Language Kits.

8) Question: I'm using ClarisWorks 4.0v2 and 4.0v4 and have the System Direction set to right-to-left. All of the menus are displayed from right-to-left as they should be, but I can't type in ClarisWorks from right-to-left--all the text I enter is always left-to-right. Does ClarisWorks support WorldScript I?

Answer: Yes, both versions of ClarisWorks that you mention are WorldScript I savvy, but ClarisWorks does not support right-to-left text. This information is found in the ClarisWorks Help file available in the Guide Menu.

9) Question: I'm using ClarisWorks 4.0v4, and the names of some of the options in the File, Format and other menus begin and/or end with an unusual character. What is this character?

Answer: You've registered ClarisWorks with the Arabic (or Hebrew or Cyrillic)

Language Register, which tells ClarisWorks to use the default font for that language. For example, the default font for Arabic is called "Geeza". So, if you register ClarisWorks with the Arabic Language Register, when ClarisWorks is launched, it will use the "Geeza" font in the menus. However, "Geeza" doesn't have an equivalent to the ellipsis, so in the File menu the 'New...' option looks like "New•", with the • representing some Arabic character. (If the System Direction is set right-to-left, the File menu '...New' option looks like "•New".)

To restore ClarisWorks to using the Roman script for menus, open any Language Register application (they're located in the Apple Extras folder on the hard drive), change the Language in the pop-up menu to "English", click on the "Register" button, and select ClarisWorks in the lower portion of the window.

Apple MPEG Card: Common Issues (5/96)

Revised: 5/6/96
Security: Everyone

Apple MPEG Card: Common Issues (5/96)

Article Created: 30 April 1996
Article Reviewed/Updated: 6 May 1996

TOPIC -----

This article contains the resolutions to some of the commonly experienced issues with the Apple MPEG card.

DISCUSSION -----

1) Issue: There is no option for MPEG video in the "Controls" window of Apple Video Player.

Resolution:

Step 1

The AMMS MPEG Decoder extension may be missing or damaged. You can reinstall the AMMS MPEG Decoder extension using the Apple MPEG Media System CD which came with the Apple MPEG Card.

Step 2

Remove the Apple Video Player Prefs file from the Preferences folder (you will lose all custom settings and channel passwords) and restart the Apple Video Player.

Note: If this does not resolve the issue, you can move the preferences file back into the Preferences folder, replacing the new one that was created, so you do not lose your custom settings.

Step 3

Ensure that the MPEG card is fully seated in the expansion slot of the logic board.

2) Issue: The video window in Apple Video Player is blank during playback of an MPEG video.

Resolution:

Step 1

If you are using QuickTime 2.0, ensure that the QuickTime 2.0 AMMS Update extension is present in the Extensions folder.

Note: You do not need this extension if you are using QuickTime 2.1 or later.

Step 2

Ensure that no other video applications have open MPEG video windows. Only one MPEG video can be played at a time.

Step 3

Remove the Apple Video Player Prefs file from the Preferences folder (you will lose all custom settings and channel passwords) and restart the Apple Video Player.

Note: If this does not resolve the issue, you can move the preferences file back into the Preferences folder, replacing the new one that was created, so you do not lose your custom settings.

Step 4

Ensure that the DVA (Digital Video Access) ribbon cable that came with the MPEG card is securely fastened to both the MPEG card and the Video-In card.

3) Issue: Certain picture adjustment controls, like sharpness, have no effect on MPEG video.

Resolution: MPEG video playback is independent of these settings. Set the video window to "Normal" size (320 x 240) in order to avoid pixel-doubling and achieve maximum image clarity.

4) Issue: During MPEG video playback, the audio intermittently skips and speeds up as if it were interrupted and is trying to catch up with the video track.

Resolution: Though MPEG video playback demands only approximately 20% of the processor's cycles, some aspects of MPEG video playback can be preempted by other processes. Ensure that no other applications or processes (file sharing, printing, and so on) are working in the background. The effect can be reproduced occasionally by simply pulling down a menu.

5) Issue: Certain MPEG movie files that can be played with applications that

support software decompression cannot be played with applications that support the MPEG card, such as Apple Video Player and MoviePlayer.

Resolution: MPEG movies designed for software decompression by applications such as Sparkle may not be compatible with the hardware decompression methods employed by the MPEG card and the applications that support it.

MoviePlayer 2.1: Purpose of Plug-ins (5/96)

Revised: 5/6/96
Security: Everyone

MoviePlayer 2.1: Purpose of Plug-ins (5/96)

Article Created: 30 April 1996
Article Reviewed/Updated: 6 May 1996

TOPIC -----

MoviePlayer 2.1 includes two plug-ins: Authoring Tools and Goodies. What are these plug-ins used for and what features do they offer?

DISCUSSION -----

These plug-ins allow you to add or modify custom color palettes, add or modify copyright information, add previews, use IMA audio compression, and use other authoring features when creating QuickTime movies. They do not affect the way movies play back.

If you are interested in developing or learning more about QuickTime software, the QuickTime Developers Kit is available from the Apple Programmer Developers Association at (800) 282-2732.

PowerBook Upgraded to PowerPC: Hard Drive Won't Spin Down (5/96)

Revised: 9/23/96
Security: Everyone

PowerBook Upgraded to PowerPC: Hard Drive Won't Spin Down (5/96)

Article Created: 30 April 1996
Article Reviewed/Updated: 6 May 1996

TOPIC -----

I recently upgraded my PowerBook 500 series computer to PowerPC. Since the upgrade, the hard drive will not spin down, even though the icon in the Control Strip indicates that it has spun down. The only time the hard drive will spin down is when the PowerBook is shutdown or sleeping. What's wrong?

DISCUSSION -----

Issue

This issue applies to any 200 or 500 series PowerBook computer which has been upgraded to PowerPC. The PowerPC processor for these PowerBook computers is not fully compatible with the hard drive driver written to the hard drive by Apple HD SC Setup.

Resolution

To alleviate this symptom, you need to update the hard drive driver with Drive Setup 1.0.3 or later.

Which PowerBook Computers are Affected?

Since the default hard disk driver for all PowerBook 200 and 500 series computers comes from Apple HD SC Setup, any such PowerBook upgraded to PowerPC will have this symptom unless the hard drive has been previously updated with Drive Setup 1.0.3 or later.

Where to Get Drive Setup

• Drive Setup 1.0.3 can be found on the Disk Tools disk image included with the CD that comes with the PowerBook PowerPC upgrade kit.

- If you have updated to System 7.5.3 from 7.5.2 by installing the System 7.5 Update 2.0, Drive Setup 1.0.4 can be found in the Apple Extras folder, inside the Utilities folder.
- Drive Setup 1.0.4 can be custom installed with the System 7.5 Update 2.0 Installer.
- Drive Setup 1.0.4 is currently posted to Apple Software Updates on AppleLink and the Internet.

This article was published in the Information Alley on 30 April 1996.

System 7.5 Update 2.0: Global Village Startup Error (4/96)

Revised: 4/30/96
Security: Everyone

System 7.5 Update 2.0: Global Village Startup Error (4/96)

=====

Article Created: 30 April 1996

TOPIC -----

I recently installed System 7.5 Update 2.0 with Open Transport 1.1. Now the Global Village Toolbox extension will not load at startup because of a memory error. How can I resolve this?

DISCUSSION -----

To prevent this memory error from occurring, you can rename the extension by putting a space in the beginning of the name. This will force the extension to load first in the startup sequence and prevent any memory heap issues from occurring.

Note that you can do this with other extensions as well if they give you similar errors.

Apple RAID 1.1: Read Me File (5/96)

Revised: 5/1/96
Security: Everyone

Apple RAID 1.1: Read Me File (5/96)

=====

Article Created: 1 May 1996

TOPIC -----

This article contains the readme file for the Apple RAID 1.1 software.

DISCUSSION -----

Apple RAID Software 1.1 Read Me

IMPORTANT Be sure to review this entire document. It contains important information that supplements the Apple RAID Software Administrator's Guide. You may want to print this document for reference.

Locating the Apple RAID Software on Your Startup Disk

The Apple RAID Software program is installed in the Apple Menu Items folder in the System Folder on the startup disk. The Apple RAID monitor program is installed in the Extensions folder in the System Folder on the startup disk. The Apple RAID Software Read Me (this document) and the SimpleText text-processing program are installed in an Apple RAID folder in the top-most directory of your startup disk.

Using the Microsoft Mail Backup Utility With Apple RAID

Because of the way in which the Microsoft Mail Backup Utility shuts down the system, the automatic backup feature of Microsoft Mail causes mirrored volumes to become out of sync. The best way to back up your Microsoft Mail Server is to follow the instructions for a manual backup in the Microsoft Mail documentation.

Rebuilding Mirrored Volumes While Running AppleShare

When rebuilding a failed or out-of-sync mirror volume while AppleShare is running, set the AppleShare Remote User Activity slide bar to less than 50%. If AppleShare is under particularly heavy use, set the slide bar to an even smaller percentage of the processor's time. These settings ensure that Apple RAID will receive the necessary processing time to perform the rebuild. (See your AppleShare documentation for details about setting the Remote User Activity slide bar.)

Using Drive Setup to Reinitialize an Apple RAID-prepared disk

If you have a disk that contains Apple RAID volumes, and you no longer want to use it for Apple RAID, first use Apple RAID to delete the volumes and then restart the server. Then use Drive Setup to reinitialize the disk. (The volumes must be deleted and the server restarted to avoid a conflict between the Apple RAID driver and Drive Setup.)

Apple RAID 1.1: New Features and Changes (5/96)

Revised: 5/9/96
Security: Everyone

Apple RAID 1.1: New Features and Changes (5/96)

=====

Article Created: 1 May 1996
Article Reviewed/Updated: 9 May 1996

TOPIC -----

This article provides the changes in Apple RAID version 1.1.

DISCUSSION -----

These are the changes in Apple Raid 1.1:

RAID Driver

Reinitializing the drives is no longer necessary when implementing RAID. The Administrator must install the Apple RAID disk driver on each hard disk that will contain mirrored or striped volumes. The easiest way to install the Apple RAID disk driver is to use the Install Driver command. The Install Driver command is also recommended for older versions of Apple RAID drives.

Apple RAID will now be "installable" over the Apple hard disk driver. Previously, a user needed to "reformat" a disk drive to use Apple RAID.

The Get Info command displays the amount of free space within a volume, and the Apple RAID Setup program displays the amount of disk space not allocated to a volume.

Weighted Striping

Apple RAID allows up to eight partitions per disk; stripe and mirror partitions can reside on the same disk. Apple RAID volumes are limited to 2 GB with no more than 10 Apple RAID volumes per server system. If the server has more than one SCSI bus, the partitions should reside across both buses. A striped volume is limited to a maximum of 4 GB or a minimum of 10 MB.

The main advantage of weighted striping is the ability to balance the data

throughput of RAID volumes on two separate SCSI buses of unequal speed. For instance, the 8550/132 has both a 5 MB/s and 10 MB/s bus. Two drives are installed, one connects to the 5 MB/s channel, the other to the 10 MB/s channel. With normal striping, the maximum theoretical throughput on each SCSI channel is the speed of the slower bus. With "weighted striping" the RAID software optimizes throughput on both buses, taking into consideration that one bus is faster and "weighting" these transfers. The result should be better data throughput on the 8550/132 SCSI subsystem. The cabling, bracket and software, will be included as standard elements with all 8550 systems. The user will just need to add the second drive.

Server Manager Support

Server Manager will receive error messages from Apple RAID, enabling system administrators to receive remote notification of a failed Apple RAID volume through e-mail, paging, or other Server Manager features.

Upgrades/Compatibility

Apple RAID 1.1 is only supported on PCI-based workgroup servers. Since Apple RAID 1.1 is not supported on NuBus workgroup servers, no upgrades to version 1.1 are available.

Clarification

The PCI RAID Card is not part of Apple RAID 1.1. The PCI RAID Card is an option for the Network Server 500 or 700, and requires the AIX operating system. The PCI RAID Card is not Mac OS compatible.

Power Macintosh: Mono Recording level Lower than Stereo (5/96)

Revised: 5/1/96
Security: Everyone

Power Macintosh: Mono Recording level Lower than Stereo (5/96)

=====

Article Created: 1 May 1996

TOPIC -----

When I input a stereo signal into my Power Macintosh computer, then use my recording application software to record in mono, I notice a drop in the signal level if I turn down the right or left source signal. Why?

DISCUSSION -----

When the Macintosh is set to record in Mono mode, it adds together the signals of both the left and the right inputs and averages them together into a mono signal. This averaged mono signal is a lower level signal. By summing and averaging the right and left inputs into a mono signal rather than picking one input no information is lost from either input.

If there are concerns that the input level of mono recordings are lower than those of stereo recordings there are a couple of workarounds.

Increase Source Signal Level

Have them increase the level of the signal that they are supplying to the Macintosh. This compensates for the reduction due to the averaging to a mono signal.

Use Hardware Splitter

If you are supplying a mono signal to the macintosh, you can use a splitter that would take the mono signal and split it into two signals. The splitter would be a Y-cable that would have a connector on one end for the signal input (3.5mm, 1/4-in or RCA jack) and the other end would have two RCA jacks to connect to the sound input jacks, or a stereo 3.5mm jack which could be connected to the Microphone input.

Macintosh PowerBook PCMCIA Expansion Module ReadMe (5/96)

Revised: 5/2/96
Security: Everyone

Macintosh PowerBook PCMCIA Expansion Module ReadMe (5/96)

=====

Article Created: 2 May 1996

TOPIC -----

This article contains the text of the Read Me file for the Macintosh PowerBook PCMCIA Expansion Module.

DISCUSSION -----

Overview

Congratulations on purchasing your PowerBook PCMCIA Expansion Module. This document adds to and updates the information in the manuals that came with your module. It is a good idea to read this document now, and keep a copy handy for future reference.

If your PowerBook computer* is connected to a printer, choose Print from the File menu to print a copy of this document. When you are finished reading and printing, choose Quit from the File menu to quit the SimpleText application program.

* NOTE: Apple does not recommend that any PCMCIA module be used with PowerBook 550c computer. The PowerBook 550c is available only in Japan.

Contents

=====

Tips

- Using PC Cards
- Using a DOS-formatted PC Card

Troubleshooting

- Selecting a PC Card as a startup disk
- Starting machine with PC Card(s) inserted

Tips

====

Using PC Cards

- For best results, purchase only cards that have been qualified for use on a Macintosh computer. If you are in the United States, you can receive a faxed list of currently available PC Cards by calling 1-800-462-4396 and requesting document 10307. You can call this number anytime. In Canada, call 1-800-263-3394 and request document 10307. Outside the United States and Canada, please consult your Apple-authorized dealer.

- Don't use an SRAM storage card as a startup disk on your PowerBook. Use SRAM cards for extra storage only.

- Never eject a PC Card manually (with a paper clip) while the PowerBook is in sleep. You may damage the card or lose data.

Using a DOS-formatted PC Card

- If your PowerBook has the Macintosh PC Exchange control panel installed and PC Exchange is turned on, you can use a PC Card that has been preformatted in a DOS format in your PowerBook. However, you cannot start up your computer using the DOS-formatted PC Card; you can only start up your computer using a Mac OS-formatted PC Card. If you want to reformat your DOS-formatted PC Card as a Mac OS-formatted PC Card, you need to turn PC Exchange off, and then format the card as you would any non-Mac OS-formatted disk. Follow these steps:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Open the PC Exchange control panel.

Step 3

Click the Off button and close the PC Exchange control panel.

Step 4

Insert your PC Card. A window appears asking if you want to initialize (format) the disk.

Step 5

Click Initialize to format the PC Card.

- Once the PC Card is reformatted, you can turn Macintosh PC Exchange back on in

the PC Exchange control panel.

- You cannot reformat a Mac OS-formatted PC Card as a DOS-formatted PC Card with PC Exchange. To do so, you need to use a DOS/Windows computer with PC Card capabilities.

Troubleshooting

=====

Selecting a PC Card as a startup disk

- The user may experience some difficulty in selecting a PC Card as a startup disk. If a system alert "beep" is heard when attempting to select a PC Card as a startup disk, simply restart the machine, then reselect the startup disk.

Starting the computer with PC Card(s) inserted

- Under some configurations, the user may experience problems when starting up with a PC Card inserted. If this occurs, remove the PC Card before starting the computer.

PC Compatibility Card (12-inch): Adding Memory (2/97)

Revised: 2/11/97
Security: Everyone

PC Compatibility Card (12-inch): Adding Memory (2/97)

Article Created: 2 May 1996
Article Reviewed/Updated: 11 February 1997

TOPIC -----

I need to add memory to my 12-inch PC Compatibility card, but I'm not sure what type of memory I need to purchase. What type of memory can I use?

DISCUSSION -----

Compatibility
=====

The 12-inch PC Compatibility cards use JEDEC-standard 168-pin DIMMs (dual inline memory module) DRAM cards. The DIMMs should be 64-bit-wide, 168-pin fast-paged mode (FPM) with a 70ns access time or faster. DIMMs built with either Extended Data-out (EDO) or asymmetrical DRAMs are not supported on the 12-inch PC Compatibility card.

NOTE:

If you are adding a 32 MB or 64 MB DIMMs to the PC Compatibility Card, then you may need to install the PC Setup DIMM Patch from one of the Apple Online Software Updates areas. See the Technical Information Library article "12 Inch PC Compat Card: Freezes With 32 MB & 64 MB DIMMs" for more information.

Expansion
=====

The 12-inch PC Compatibility card comes standard with 8 MB of on-board DRAM. In addition, the 12-inch PC Compatibility card has one RAM expansion slot. You can use DRAM configurations with DIMMs of these sizes: 8, 16, 32 or 64 MB. The exact configuration depends on the density of the DRAM chips that are mounted on the DIMMs. You can increase the 12-inch PC Compatibility card total DRAM to up to a maximum of 72 MB.

This article appeared in the 1 November 1996 issue of the Information Alley.

PC Compatibility Card (7-inch): Adding Memory (2/97)

Revised: 2/11/97
Security: Everyone

PC Compatibility Card (7-inch): Adding Memory (2/97)

Article Created: 2 May 1996
Article Reviewed/Updated: 11 February 1997

TOPIC -----

I need to add memory to my 7-inch PC Compatibility card, but I'm not sure what type of memory I need to purchase. What type of memory can I use?

DISCUSSION -----

Compatibility
=====

The 7-inch PC Compatibility cards uses JEDEC-standard 168-pin DIMMs (dual inline memory module) DRAM cards. The DIMMs should be 64-bit-wide, 168-pin fast-paged mode (FPM), 2K refresh rate with a 70ns RAM access time or faster. DIMMs built with either Extended Data-out (EDO) or asymmetrical DRAMs are not supported on the 7-inch PC Compatibility card.

All DIMMs currently available from Apple Computer are 2K refresh rate so you can safely use them in your 7-inch PC Compatibility card.

Expansion
=====

The 7-inch PC Compatibility card has one RAM expansion slot on board. You can use DRAM configuration with DIMMs of these sizes: 8, 16, 32 or 64 MB. The exact configuration depends on the density of the DRAM chips that are mounted on the DIMMs. You can increase the 7-inch PC Compatibility cards total DRAM to up to a maximum of 64 MB.

Article Change History:
11 Feb 1997 - Reworded for clarity.
23 Aug 1996 - Added information about asymmetrical DRAM.

Apple System Profiler: Read Me (5/96)

Revised: 5/2/96
Security: Everyone

Apple System Profiler: Read Me (5/96)

=====

Article Created: 02 May 1996

TOPIC -----

This article contains the ReadMe file for Apple System Profiler v1.0 and v1.0.1, which are available to Apple Macintosh users.

DISCUSSION -----

Apple System Profiler (ASP) lets you gather information about the configuration of your computer. The information that ASP reports may be useful if you place a call to the Apple User Assistance Center.

If you have one of the computers listed below, we recommend that you install Apple System Profiler now. Note that you MUST be running Mac OS version 7.5.2 or 7.5.3 to successfully install Apple System Profiler.

- Power Macintosh 9500, 8500, 8100, 7600, 7500, 7200, 7100, 6100, 5400, 5300 and 5200 series.
- PowerBook 5300, 2300 and 190 series.
- Macintosh Performa 6300, 6200, 6100, 5300 and 5200 series.

Apple System Profiler will only install on the computers listed above. Do NOT attempt to install it on any other computers.

Installation instructions:

1. Locate the Apple System Profiler Installer. It is in the same folder as this document.
2. Double-click on the Apple System Profiler Installer application.

You'll see a confirmation message when installation is complete. The Apple System Profiler will be placed in the Apple menu. To use ASP, open the Apple menu and choose Apple System Profiler.

Apple System Profiler: Processor Speed Misidentified (5/96)

Revised: 5/2/96
Security: Everyone

Apple System Profiler: Processor Speed Misidentified (5/96)

=====

Article Created: 2 May 1996

TOPIC -----

I recently bought what I thought was a Power Macintosh 8500/132. However, I just ran the Apple System Profiler application, and it reported that I have a Power Macintosh 8500/120. What's going on? Was I given the wrong computer?

DISCUSSION -----

No, it is likely that you have the correct computer, but you are using a version of the Apple System Profiler that does not support the new Enhanced PCI-based Power Macintosh computers*.

You should be using version 1.0.1, which is available on the online services. This new version of the Apple System Profiler corrects this misidentification of processor speed. In version 1.0.1, the processor speed for these computers is omitted from the description line.

*The enhanced PCI-based Power Macintosh computers include the following series:

- Power Macintosh 7200/120
- Power Macintosh 7600/120
- Power Macintosh 8500/132
- Power Macintosh 8500/150
- Power Macintosh 9500/150

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

LaserWriter/Localtalk Bridge Conflicts w/ Open Transport (5/96)

Revised: 5/6/96
Security: Everyone

LaserWriter/Localtalk Bridge Conflicts w/ Open Transport (5/96)

Article Created: 2 May 1996
Article Reviewed/Updated: 6 May 1996

TOPIC -----

I have recently added a Power Macintosh 7200 to my network which consists mostly of Macintosh Quadra 800 computers. When I open the Chooser on the Power Macintosh computer I get a message that says, "The LaserWriter Bridge cannot continue because of a network number conflict." What's wrong?

DISCUSSION -----

Symptoms

There are times when neither a LaserWriter Bridge, or a LocalTalk Bridge, running on any Nubus-based Macintosh computer system, can coexist on a network which includes a Macintosh computer running Open Transport (such as a Power Macintosh 7200).

There are no problems until the person running Open Transport on their computer opens the Chooser. At this time, either type of bridge may quit with one of the following two messages:

1) "The LaserWriter Bridge cannot continue because of a network number conflict."

or

2) "The LocalTalk Bridge cannot continue because of a network number conflict."

Issue

The problem is caused when the person running Open Transport on their computer sets a user-defined network range in the AppleTalk control panel.

Resolution

To fix this, do either of the following two things:

1) Open the AppleTalk Control Panel and change the network ID.

or

2) Un-check the "User Defined" AppleTalk address box. Turn off Appletalk. Then reactivate it again.

Of these two solutions, the second is a better choice. A user should not have to hard wire a network or node ID on a system to correct this situation.

Apple Video Player: Corrupted Pref file Causes Wrong Tint (5/96)

=====

Article Created: 3 May 1996
Article Reviewed/Updated: 8 May 1996

TOPIC -----

I am using the Apple Video Player and it worked properly for a while. However, now the input window shows everything with a pink tint. How can I get rid of the tint?

DISCUSSION -----

If the preference file gets corrupted, you get the unexpected tint. To correct this, open your Preference folder, inside your System folder, and throw away the Apple Video Player Pref file.

The next time you open the Apple Video Player a new preference file is created and Apple Video Player displays the proper tint.

Power Macintosh 7500 and 7600 Series: 150 MHz Processor? (5/96)

Revised: 9/23/96
Security: Everyone

Power Macintosh 7500 and 7600 Series: 150 MHz Processor? (5/96)

=====

Article Created: 03 May 1996

TOPIC -----

Will the 150 MHz processor card that is used in the new configurations of the Power Macintosh 8500/150 and 9500/150 computers work in the Power Macintosh 7500 and 7600 series of computers?

DISCUSSION -----

Apple does not currently offer the 150 MHz processor card for use in the Power Macintosh 7500 and 7600 models. The Power Macintosh 8500/150 and 9500/150 computers are currently the only Apple products that are available with the 150 MHz processor card. In the future, Apple may announce an upgrade path to the 150 MHz processor card.

Network Server 500: Why It May Not Power On (5/96)

Revised: 5/3/96
Security: Everyone

Network Server 500: Why It May Not Power On (5/96)

=====

Article Created: 3 May 1996

TOPIC -----

After I added several third-party SCSI devices, my Network Server 500 does not power on. Why?

DISCUSSION -----

Overview

=====

This document explains the reasons why a Network Server 500 may not power on after the addition of several third-party SCSI devices.

* NOTE: This discussion does not apply to the Network Server 700.

Symptom

=====

Third-party drive testing at Apple has revealed that some SCSI devices may cause the Network Server 500 power supply to fail to power on. The unit fails to exhibit ANY response (no LED or LCD flash) to a front panel or keyboard power-on request. This problem is only seen if several third-party SCSI devices are installed. Hard drive, tape and CD-ROM Option Kits shipped by Apple do not provoke this problem, nor do many third party drives, tapes, and CD-ROM drives.

Cause

=====

When several third party devices are installed in combination, they exhibit transient (power-on) loads on the +12 volts that exceed the short-circuit detect trip point of the Network Server 500 power supply.

If you have NOT added third party SCSI devices, it is likely that there is some other cause. The most common of these other causes are:

- 1) Rear Keyswitch is not fully locked.
- 2) Main Logic Module (Rear Drawer) is not fully seated with all four thumbscrews tightened.
- 3) Processor Card is not fully seated.

Workaround

=====

If the "no power on" symptom is experienced, following this procedure allows the power supply to properly power up in the system:

Step 1

Unseat the SCSI devices, but leave the root hard drive plugged in (otherwise you will have to startup from Open Firmware).

Step 2

Unplug the unit from the AC wall outlet for at least 45 seconds.

Step 3

Replug the unit into the AC.

Step 4

Power-on from the keyboard or front panel.

Step 5

Reseat the SCSI devices before AIX starts booting.

NOTE:

The power supply is not damaged by the failure to power-on. Unseating the offending SCSI devices will allow the unit to successfully power on.

Color OneScanner 600/27: Dispatcher Software Description (5/96)

=====

Article Created: 5 May 1996

TOPIC -----

This article contains a description of the Apple Color OneScanner 600/27 Dispatcher software.

DISCUSSION -----

The OneScanner Dispatcher software that enables the user to scan, edit and archive images or documents. It provides scanner integration with other office products and software applications. Provides an effortless, central guide to many functions including: scanning, image editing, OCR, printing, faxing, copying, document archival/retrieval and drag and drop access to other applications. Also provides scanning directly into PhotoShop with an included plug-in module.

The OneScanner Dispatcher Image Editor allows the user to perform all basic functions to edit any image. It contains a Tool Pallet with all of the conventional graphic and text edit options, including those to select images, add text or color, erase portions of the image. Specifically it contains a selection rectangle, grabber, paint bucket, eraser, spray can, clone, lasso, zoom, text, pencil, paintbrush, smudge, and displays the current background and foreground color. These Tool Pallet options are recognizable and are the industry standard. But you cannot compare these graphic and text options with such image creation and manipulation tools available in such programs as Adobe PhotoShop.

The image editor can edit file formats, JPEG, TIFF, PICT PHOTOSHOP 2.5, and EPS. Blurring and sharpening filters can be applied or any PhotoShop compatible plug-in filters such as Kai's PowerTools can be used to enhance the image.

Three automated functions are: Suggest a Crop, which estimates the best possible crop automatically based on the pre-scan; Adjust Tone, which automatically measures and adjusts the brightness and contrast ratios within the image based on the pre-scan and Straighten which automatically straightens a document or

image based on the pre-scan.

The user can select an area to be cropped by simply moving the cursor over the prescanned image and selecting the area by holding down and dragging. The magnifying glass on the far left of the scanning interface zooms in or out on the pre-scanned image or functions as a manual cropping tool in the pre-scan by clicking on the magnifying glass.

The Tone button allows the user to manually choose from a selection of 9 contrast/brightness adjusted images or manually move sliding toggles to adjust brightness and contrast of the image. This information is then applied to the final scan when selected. The fine tune shows the result of a selected image and allows the user to further tweak the brightness or contrast if needed.

In the Image menu are such options as zoom in and out, invert, brightness and contrast control, color balance, sharpen, resize, crop, flip, rotate, image depth, effects (if you've installed compatible plug-ins), ColorSync Preferences, and how you wish your archived imaged displayed (by name, date, type, or size).

AppleVision Software Fix for System 7.5 Update 2.0 Read Me(1/97)

Revised: 1/29/97
Security: Everyone

AppleVision Software Fix for System 7.5 Update 2.0 Read Me(1/97)

=====

Article Created: 6 May 1996
Article Reviewed/Updated: 29 January 1997

TOPIC -----

This article contains the ReadMe file for AppleVision Software Fix. This software should be installed by users who have an AppleVision 1710 Display or AppelVision 1710AV Display and have installed System 7.5 Update 2.0.

DISCUSSION -----

This document contains important information for AppleVision customers.

Who needs to install the AppleVision Software Fix?
=====

If you have an AppleVision Display and you have problems after installing the System 7.5 Update 2.0, you should install the AppleVision Software Fix. This software fixes such problems as:

- When you press the buttons on the front of the display, you see a message that says "No AppleVision Display is connected."
- You have a Power Macintosh 7200 and can't find the Monitors & Sound control panel in the Control Panels folder.
- The Monitors & Sound control panel does not have Geometry, Color, and Monitor Sound buttons. (Note: The Monitor Sound button appears only if you have an AV monitor.)
- You can't change the resolution of the AppleVision Display or you can't open the AppleVision Setup control panel.
- Macintosh Guide does not contain information on the AppleVision Software or Display.

How to install the AppleVision Software Fix =====

After you install System 7.5 Update 2.0 and AppleVision Software 1.0.x, you can install the AppleVision Software Fix. Follow these steps:

Step 1

If you don't already have an AppleVision Software Fix floppy disk, then copy the AppleVision Software Fix online disk image to a floppy disk.

Step 2

Insert the floppy disk in your computer and double-click the Installer icon.

What is installed?

=====

68040 or non-PCI

On a 68040 or non-PCI Power Macintosh computer, the installer adds the following files to the System Folder:

- (1) Display Enabler version 2.0.2 is added to the Extensions folder.
- (2) AppleVision Guide Additions version 1.1 is added to the Extensions folder.

PCI-based Power Macintosh

On a PCI-based Power Macintosh computer, the installer adds the following files to the System Folder:

- (1) Monitors & Sound version 1.1 is added to the Control Panels folder.
- (2) SystemAV version 1.1 is added to the Extensions folder.
- (3) °AppleVision version 1.0.4 is added to the Extensions folder.
- (4) Monitors & Sound Guide Additions version 1.0 is added to the Extensions folder.
- (5) AV Monitors Guide Additions version 1.0 is added to the Extensions folder.
- (6) SimpleSound version 1.0 is added to the Apple Menu Items folder.

If you have a 68040 or non-PCI Power Macintosh

=====

When you installed System 7.5 Update 2.0, if you used the Custom Install option

to put the Monitors & Sound control panel on a 68040 or non-PCI Power Macintosh, the AppleVision software will not work.

To use the AppleVision Software, follow these steps:

Step 1

Remove the Monitors & Sound control panel from the Control Panels folder.

Step 2

Remove °AppleVision extension from the Extensions folder.

Step 3

Restart the computer.

Step 4

Install AppleVision Software version 1.0.x.

Step 5

Install the AppleVision Software Fix.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Macintosh Performa 6200: Can't Record from 1710AV Display 12/96

Article Created: 6 May 1996
Article Reviewed/Updated: 19 December 1996

TOPIC -----

I am having difficulty using the built-in microphone of the AppleVision 1710AV Display with my Macintosh Performa 6200CD. Whenever I attempt to record sounds with this setup, the recording appears muffled and contains a lot of static. However, if I connect the PlainTalk microphone directly into the computer, I get clear sound recordings. What could be causing this to happen?

DISCUSSION -----

Apple is aware of this issue and is investigating it. It does not appear to be an issue with the AppleVision 1710AV Display. Rather, it appears that this issue can occur on all computers with a this form factor, including the Macintosh 630, 6200, and 6300 series computers.

This audio issue also occurs with the Macintosh Performa 6400 computer.

Currently, the only workaround is to use the PlainTalk microphone connected directly to the computer's microphone port.

Note:

The following computers are in the corresponding Macintosh families:

- Macintosh 630CD family: LC 630, Quadra 630, Performa 630, Performa 631, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640.
- Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216, Performa 6218, Performa 6220, and Performa 6230.
- Macintosh 6300CD family: Performa 6300, Performa 6290

This article was published in the Information Alley on 4 December 1996.

Article Change History:

19 Dec 1996 - Added Macintosh Performa 6400 to the article.

04 Dec 1996 - Added keyword.

02 Dec 1996 - Changed distribution status.

System 7.5 Update 2.0: Energy Saver Update Not Installed (5/96)

Revised: 9/23/96
Security: Everyone

System 7.5 Update 2.0: Energy Saver Update Not Installed (5/96)

Article Created: 6 May 1996

TOPIC -----

I have a Power Macintosh 7200/90 computer. I recently installed System 7.5 Update 2.0, but now I cannot open the Energy Saver Guide in the Energy Saver control panel. What's going on?

DISCUSSION -----

System 7.5 Update 2.0 does not install the latest version of the Energy Saver Guide, control panel, or extension when performing an "Easy Install." However, these files are correctly updated on Power Macintosh 7500, 8500, and 9500 series computers.

Use the System 7.5 Update 2.0 installer to Custom Install the update to Energy Saver 2.0.1 by following these steps:

Step 1

Launch the System 7.5 Update 2.0 installer.

Step 2

Choose "Custom Install" from the pop-up menu in the top left corner.

Step 3

Under the Custom Install window, click once on the arrow to the left of "Control Panels", so the arrow points down.

Step 4

Click once in the check box next to "Energy Saver".

Step 5

Click the Install button to finish the installation.

QuickDraw GX 1.1.2: Printing Issues on PCI Macintosh (5/96)

Revised: 10/28/96
Security: Everyone

QuickDraw GX 1.1.2: Printing Issues on PCI Macintosh (5/96)

=====

Article Created: 6 May 1996

TOPIC -----

My Power Macintosh 7500 freezes when I attempt to print to a LaserWriter using QuickDraw GX. I had the same problem using the LaserWriter 8.2.2 printer driver, but when I used the LaserWriter 8.3.2 software, I could print correctly. Why am I having problems using the LaserWriter GX printer driver?

DISCUSSION -----

The problem is related to some known printing issues with PCI-based Macintosh computers. The problems are resolved with some new AppleTalk PAP/ATP fixes included in the LaserWriter 8.3.2 printer driver, and the 7.5.2 Printing Fix extension. If System 7.5.2 Update 2.0 is installed, the Printing Fix extension is no longer needed.

In the QuickDraw GX environment, the LaserWriter GX driver has not been revised to include the AppleTalk PAP/ATP fixes. This is the reason that the LaserWriter GX driver (J-1.1.2) does not work. The QuickDraw GX engineering team have scheduled the fixes to be rolled into QuickDraw GX v1.2. Currently, there is no release timeline, but It will definitely be a part of the Copland OS.

One possible workaround to this issue if the customer wants to use QuickDraw GX is to use QuickDraw GX Helper. This allows you to use the LaserWriter J1-8.3.2 driver within QuickDraw GX. The Tech Info Library article titled "QuickDraw GX: Workaround For Fax Capable Apple Printers" explains how to use QuickDraw GX Helper -- the article actually refers to using QuickDraw GX helper for PostScript Fax, however, the same steps would apply to utilizing the LaserWriter J1-8.3.2 driver.

The Tech Info Library article "System 7.5 Update 2.0: What's New in This Update (3 of 3)" outlines the PCI-based Macintosh printing issues, and resolutions.

QuickTime Conferencing: Questions & Answers (6/96)

Revised: 6/11/96
Security: Everyone

QuickTime Conferencing: Questions & Answers (6/96)

Article Created: 6 May 1996
Article Reviewed/Updated: 11 June 1996

TOPIC -----

This article contains QuickTime Conferencing questions and answers.

DISCUSSION -----

Question: PictureTel system is strapping an ISDN (Integrated Services Digital Network) board to ATM (Asynchronous Transfer Mode) board to trick it into thinking its on ISDN when it's really on ATM. Therefore, how will Apple be supporting ATM and when? Or, fast Ethernet? (Is this ISO-Ethernet?)

Answer: Apple has made no announcements about supporting ATM or fast Ethernet at this point, primarily because of the component architecture of QuickTime Conferencing (QTC). QTC has a separate transport layer that can be written for specific protocols you want QTC to use (ATM, Fast Ethernet, or ISO-Ethernet). Customers could write their own transport component for their needs. National Semiconductor announced plans to build a ISO-Ethernet card at the QuickTime Conferencing intro in February 1995, but you need to check with National Semiconductor concerning availability of this card.

Question: How can I interface Ethernet/T1 to ISDN for remote sites that do not have T1 access? In other words, if one user is on T1 can they connect to an ISDN user?

Answer: ISDN implements the ISDN-1 standard for a BRI (Basic Rate Interface) giving the user 2 B (56 or 64 kbps) and 1 D channels. T1 implements the ISDN-2 standard where the user has 23 B (56 or 64 kbps) and 1 D channel. If both the BRI and PRI use H.320, then they can use it. Otherwise they will likely use IP to communicate with each other.

Question: Does the H.320 take advantage of its hard compression over an existing

Ethernet LAN or Fast Ethernet or ATM?

Answer: No, the H.320 hardware component is only used in an ISDN WAN connection.

Once you switch the network type to AppleTalk or TCP/IP instead of ISDN, then you no longer interface with the H.320 board and cannot take advantage of the hardware H.320 compression. QTC does include a software H.261 compressor for the LAN video. H.261 is a subset of the H.320 standard, so in actuality some H.320 can occur, but the preferred compressor for a LAN connections is JPEG for IP and Apple Video Compressor for AppleTalk.

Question: For normal Internet access is additional software required? Is anything different required of the ISP (Internet Service Provider), or the Internet connection such as router, CSU/DSU?

Answer: The currently shipping QTC/ISDN Kit does not include software for an internet connection with an ISP. You can connect to an ISP with no additional hardware, you just need software.

Question: Is it possible to use either a point-to-point connection, or Apple Remote Access connection over an ISDN line with QuickTime Conferencing?

Answer: The current version of QuickTime Conferencing requires Ethernet or an installed H.320 ISDN card.

Apple IP Gateway 1.0.1: Setting Up Multiple Gateways (5/96)

Revised: 5/6/96
Security: Everyone

Apple IP Gateway 1.0.1: Setting Up Multiple Gateways (5/96)

Article Created: 6 May 1996

TOPIC -----

This article describes how to setup Apple IP Gateway 1.0.1 so you have multiple gateways in the same zone.

DISCUSSION -----

You can set up multiple Apple IP Gateways in the same AppleTalk zone. Doing so allows you to balance the gateway service load between multiple machines, as well as to provide service to an additional 253 users per gateway.

To set up multiple gateways, you must configure the gateway to provide automatic addresses only; you cannot use manual addresses with multiple gateways. Also, Power Macintosh clients will not be able to locate a gateway if there are multiple gateways in a zone. Only MacTCP clients on non-Power Macintosh machines will be able to locate a gateway if multiple gateways are in use.

Follow these steps to set up multiple gateways in the same zone:

Step 1

Purchase another copy of the Apple IP Gateway and install it on another machine.

Step 2

Set up the second gateway machine in the same zone as the original gateway.

Step 3

Divide the automatic address range of the original gateway into two ranges. Configure the original gateway with one of these ranges and the second gateway with the remaining range.

Step 4

Start both gateways.

Clients connect to the first gateway that responds. When a gateway has no more addresses to give out, it ceases responding, thus allowing another gateway to respond to the client.

IMPORTANT:

If you have Power Macintosh clients that need to access a gateway, do not set up multiple gateways in the same zone.

General Computers: A+ Certification Program (5/96)

Revised: 5/7/96
Security: Everyone

General Computers: A+ Certification Program (5/96)

=====

Article Created: 7 May 1996

TOPIC -----

This article contains information on the A+ Certification testing program.

DISCUSSION -----

The A+ Certification is a testing program sponsored by the Computing Technology Industry Association (CompTIA) that certifies the competency of service technicians in the computer industry. Anyone who wants a nationally recognized credential as a competent computer service professional can take the A+ exams. The program is backed by major computer hardware and software vendors, distributors, resellers and publications as well as a leading industry service organization, the Association of Field Service Management, Inc.

To become certified you must pass two test modules - the Core and one of two other specialties, either the Microsoft Windows/DOS module or the Macintosh module.

Candidates for certification may register by phone by calling: (800) 77-MICRO and schedule their testing session at a Drake Authorized Testing Center.

Mail*Link for PowerTalk/MS 1.6: ReadMe (5/96)

Revised: 5/7/96
Security: Everyone

Mail*Link for PowerTalk/MS 1.6: ReadMe (5/96)

=====

Article Created: 7 May 1996

TOPIC -----

This article is the Mail*Link for PowerTalk/MS 1.6 Read Me File.

DISCUSSION -----

Mail*Link for PowerTalk/MS 1.6

Mail*Link PT/MS for PowerTalk is a personal e-mail gateway for PowerTalk users. This gateway will allow PowerTalk users to send and receive mail into the StarNine Mail system or, as formerly known, Microsoft Mail for AppleTalk system. Mail can be sent and read with any PowerTalk mail-enabled application.

This release of Mail*Link® for PowerTalk™/MS is the first release of this gateway by Apple Computer Inc. This gateway is functionally equivalent to version 1.0.0. Future versions of this software will be modified and enhanced.

This software is licensed to you under the Macintosh System 7.5 license agreement. All terms and conditions of this license must be followed.

Note: If you are upgrading from version 1.0.0 it is VERY IMPORTANT that you follow the instructions in the Upgrading Section below.

The installation and upgrade procedure for this software will still install the StarNine demonstration key files (which were part of the 1.0.0 release). However the 1.6 release of the gateway has been modified to ignore the key files and thus will never expire.

To use the PT/MS gateway you must have the Microsoft Mail Extension installed in the Extensions folder of your System folder. The Microsoft Mail Extension is part of Microsoft Mail for AppleTalk. Please refer to the PT/MS User Guide for more information.

ITEMS OF NOTE

=====

- Power PC: If you are using a Power PC, turn off the modern memory manager before installing PT/MS. After you have completed the gateway configuration described in Chapter 2 and are sure that the gateway is working properly, turn the modern memory manager back on. See "Power PC issues" on page 52 of the manual for related information.
- Gateway Operation: When you activate the PT/MS gateway, it uses the MS Mail extension to log in to the MS Mail Server specified in the Key Chain configuration window. It then sends pending mail from your Out Tray to the Server and transfers mail from your account on the Server to your PowerTalk In Tray at regular specified intervals until you deactivate the gateway or turn off your Macintosh. This process all takes place in background. While the MS Mail extension is actively communicating with the MS Mail Server, your Macintosh is temporarily unavailable for other tasks. This translates into slight freezes from time to time as you are going about your normal tasks as PT/MS logs into the server, with more significant hangups lasting a couple of seconds during large file transfers between the local disk and MS Mail Server. If the MS Mail Server is on a physically remote network or a large, busy network, the process of logging in to the Server will take longer. Increasing the interval at which you contact the MS Mail Server will mitigate hangups (An interval less than three or four minutes will hang your machine up in continual PowerTalk processing leaving no time for your machine to do anything else. We recommend a connection interval of at least five minutes).

INSTALLATION INSTRUCTIONS

=====

For new installations only:

We recommend that you install this software via the installer script.

1. Double click on either the "Installer" icon.
2. Select the drive on which you wish to install this software and click Install.
3. Reboot the system after the software has been properly installed.

UPGRADE INSTRUCTIONS

=====

If you are upgrading from a previous release of Mail*Link PT/MS for PowerTalk, you should follow these instructions:

1. Install the software as instructed in the section "GETTING STARTED - Installing Mail*Link PT/MS".
2. After the system has rebooted, open the "PowerTalk Key Chain".
3. Open the PT/MS personal gateway in the key chain. The installation procedures change the file-id that PowerTalk uses to locate the Mail*Link PT/MS file. Opening and closing the PT/MS Service

configuration window will cause the new file-id to be written into the PowerTalk configuration file.

4. Close the key chain. You will be told that you must reboot the system before PowerTalk will activate the gateway.
5. Reboot the system.

If you have trouble with the gateway after upgrading please re-install by following the instructions in the Clean Upgrade Install section below.

CONFIGURATION

=====

- Creating your PT/MS personal gateway

Once you have installed the software and rebooted the system (as described above), follow these instructions to create your PT/MS personal gateway.

1. Open the "Key Chain" located on your desktop.
2. Press the "Add" button.
3. You will be presented with a list of services that are available. Select "Microsoft Mail Service".
4. A new item with the server name of "Not Configured" and a service type of "Microsoft Mail Service" will appear in your "Key Chain".
5. Proceed to the "Configuring" section below.

- Configuring your PT/MS personal gateway

Before configuring, make sure that you have selected your MS Mail server in the Chooser. If you do not select this the PT/MS gateway will not be able to connect.

To configure the PT/MS personal gateway, ensure that the "Key Chain" has been opened.

1. Double click (Open) the item with a service type of "Microsoft Mail Service". The PT/MS personal gateway only allows one instantiation, so there should only be one item with this type in the Key Chain window.
2. A configuration window will be displayed. You should configure each item in this window before closing the window. Window closing is equivalent to pressing the "OK" button in a dialog. The "Key Chain" configuration windows have no "Cancel" operation, so please ensure each item is properly filled in before closing the window (you can always come back and change the selections at a later date, but it is better if each item is properly filled in).
3. Once you have entered the information in the configuration window, close the window with a mouse click in the close box or by typing "<command>W". It may take a few seconds for the window to close. This is because PowerTalk is activating all of the personal gateway subsystems and informing them of their new configuration. Be patient.
4. Once the PT/MS configuration window is closed, close the Key Chain window.

CLEAN UPGRADE INSTALLATION

=====

Use this procedure if you are experiencing problems with the gateway software. You should not need to use this procedure for normal installs. To perform a "Clean Install" of the gateway software, use the following procedure.

NOTE: Some gateways may remove mail from your In Tray and Out Tray when they are reinstalled. Be sure to back up any items in your InTray and OutTray by dragging them to another folder on your hard drive.

NOTE: This will remove all services from your keychain, so be sure you have the passwords for these services handy. If you have personal gateways already installed, you will need to set them up again, so be sure you write down the setup information that is contained in each key, if necessary.

This procedure removes all "Mail*Link" gateways. If you have multiple "Mail*Link" gateways installed, you will need to re-install each of the gateways you want to use.

1. Open the Extensions folder, located inside the System Folder. Find the following item(s) and drag to the trash (note only the gateways you have installed will be in the Extensions folder):
Mail*Link PT/QM
Mail*Link PT/MS
Mail*Link PT/INET
2. Open the Preferences folder, located inside your System Folder. Find the following items and drag them to the trash.
StarNine (folder)
PowerTalk Setup Preferences
PowerTalk Startup Preferences
3. Find the "Mail*Link Extras" folder, on the top level of your hard drive. Drag this folder to the trash.
4. Restart your machine. After you have restarted, choose "Empty Trash" from the Special menu.
5. Double-click the installer for the desired software, and click Install at the Easy Install screen. After the installation is complete, your machine will restart. If you are installing more than one gateway, repeat this step for each gateway.
6. Open the keychain and click "Add". Select the gateway from the list of choices. A new item will be added to the Key Chain. Open this key, and configure the gateway as you normally would. The gateway should now be functioning.

MANUAL INSTALLATION INSTRUCTIONS

=====

The manual installation instructions are for advanced users who wish to build their own installation process or who wish to install only portions of this gateway. Installation using this process should be conducted only after you fully understand how to use your Macintosh, and how to configure and use PowerTalk gateways.

If you must install this version manually, please follow these instructions:

1. Place the distribution diskette in the floppy drive.
2. Open the folder named "Drop Contents on System Folder".
3. Select all of the items in this folder and drag them onto the "System Folder" icon.
4. You will be presented with a dialog box that indicates these files belong in special locations. Click "OK".
5. Close the "Drop Contents on System Folder" folder.
6. Open the folder named "Place Contents in Preferences Folder".
7. Select all of the items in this folder and drag them into the "Preferences" folder (which is located within your "System Folder").
8. If you are presented with a dialog indicating that you will be replacing existing files, click cancel. You should perform the "Automatic Installation" procedure (above).
9. Reboot the system. This is necessary because some of the software installed is only activated at boot time.

Note: With version 1.6 it is no longer required to install the key files.

KNOWN INCOMPATIBILITIES

=====

- PT/MS and MailSwitch: Running the MS Mail MailSwitch utility simultaneous with gateway operation has been reported producing odd behavior, particularly, PT/MS reports a -1981 error in its log on a mail message send. A restart should cure the confusion.

- PT/MS and RAM-Doubler: There have been some reports of inconsistencies running PowerTalk and PMSAMs with RAM-Doubler.

- When a mail message is forwarded, the name and address of the original sender are not preserved.

- CE Software's QM for AOCE may be used to send mail, although you must select the AppleMail format when sending the message. This application may NOT be used as the default mail reader. If it is selected, AppleMail will be used instead.

SUPPORT

=====

If you need any additional help installing, configuring or using this gateway please call Apple Support at: 1 (800) SOS - APPL.

StyleWriter Printers: How to Reset the Paper Tray (5/96)

Revised: 5/7/96
Security: Everyone

StyleWriter Printers: How to Reset the Paper Tray (5/96)

=====

Article Created: 7 May 1996

TOPIC -----

This article describes how to reset the paper tray on various StyleWriter model printers.

DISCUSSION -----

From time to time you might encounter a problem where a StyleWriter printer does not feed the paper properly. This might include paper feeding only on one side, pulling multiple sheets through at a time, or not pulling any paper, or envelopes through the paper feed. You can reset the paper tray by following the steps listed below. With the exception of the original StyleWriter and the Portable StyleWriter, this procedure works on all StyleWriter printers including the StyleWriter 2200.

Resetting the Paper Tray
=====

Step 1

Turn the printer off.

Step 2

Remove all paper from the paper tray.

Step 3

Reposition the paper selection lever

Note:

On the StyleWriter II, 1200, 1500, 2400, and 2500 (but not on the 2200) there is also a paper selection lever to the right of where the paper enters the printer. It is marked with an envelope icon (pull the lever forward for envelope) and a

paper icon (push the lever back for paper). This lever might also need to be adjusted. Simply pull the lever forward toward the front of the printer, then push it back into the paper position to ensure it is locked into place.

Step 4

Press and hold the power button until the orange light goes out.

Note:

The StyleWriter 1500 does not have an orange error light, so keep the power button held down for at least 30 seconds.

Step 5

The printer will make some noise during a self-test. In approximately 30 seconds, you will hear the paper tray snap two times and the orange light will come on.

Step 6

Turn the printer off

The paper tray should be reset at this point.

Testing the Printer

=====

To ensure that the paper tray is reset, re-insert paper and try printing a test page.

Step 1

Make sure the printer is off.

Step 2

Make sure there is paper in the printer.

Step 3

Press and hold on the power button until the orange light goes out.

Step 4

The printer will make some noise during a self-test. The StyleWriter printer should pull a piece of paper through the paper feed and print a test page.

PC Setup 1.0.7: Untested with System 7.5.3 (6/96)

Revised: 6/11/96
Security: Everyone

PC Setup 1.0.7: Untested with System 7.5.3 (6/96)

Article Created: 7 May 1996
Article Reviewed/Updated: 11 June 1996

TOPIC -----

The CD version of System 7.5 Update 2.0 contains a separate installer for DOS Compatibility Card software version 1.0.7. Will this work with System 7.5.3?

DISCUSSION -----

Although the installer for the DOS Compatibility Card software v1.0.7 is included on the CD, this software is not supported for use with System 7.5.3.

DOS Compatibility Software Update 1.5 is now available from the online services and the Apple Order Center. Apple recommends using this version with Apple DOS Compatibility cards, except for those used in Macintosh Quadra and Centris 610 computers.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

PC Exchange: Mounting Hybrid DOS/Macintosh CD (5/96)

Revised: 5/7/96
Security: Everyone

PC Exchange: Mounting Hybrid DOS/Macintosh CD (5/96)

Article Created: 7 May 1996

TOPIC -----

I have a CD-ROM disc, which has both a Macintosh and Windows format on the disc. I want to see the Windows files, but the only icon I can see on the desktop is for the Macintosh partition. Is there a way to force PC Exchange into mounting the MS-DOS/Windows partition?

DISCUSSION -----

This is problem with the older versions of the Apple CD-ROM driver. However, if you install CD-ROM Setup 5.1.5, you will be able to mount both partitions. Of course, this runs into the problem of needing a CD-ROM disc in the drive at startup in order for the PC to use the drive (assuming you have the DOS Compatibility Card installed). If you are not familiar with this problem, it is documented in the Tech Library article titled "DOS Compatible: CD-ROM Needs to be in Drive at Startup".

Version 1.5 of the DOS Compatibility software installs CD-ROM Setup 5.1.6 and also corrects the problem mentioned above.

The steps required to see the DOS/Windows partition are:

Step 1

Insert the hybrid CD-ROM into the drive (just so the CD-ROM is in at restart).

Step 2

Install CD-ROM Setup 5.1.5 and restart.

You should now be able to see the PC partition on the PC and the Macintosh partition on the Macintosh.

Newton Backup Utility: Only Available Ports Can Be Used (5/96)

Revised: 5/7/96
Security: Everyone

Newton Backup Utility: Only Available Ports Can Be Used (5/96)

=====

Article Created: 7 May 1996

TOPIC -----

I installed Newton Backup Utility on Windows 95 and it only allows me to configure the software to connect to the COM2 port. Why doesn't it allow me to connect to the COM1 serial port?

DISCUSSION -----

When the Newton Backup Utility starts up, it searches for available ports. If a port is in use it does not give the option to select that port. Using a Windows computer configured with a COM1 serial mouse, Newton Backup Utility only gave us the option to connect to COM2 and not COM1. We then installed on another Windows computer that was not using COM1 for the mouse, and Newton Backup Utility allowed us to select either the COM1 or COM2 port.

Newton only lets you select "available" ports. You will see the same results using Windows 95, Windows 3.11, or Windows for Workgroups

Fonts: Renamed Font Always Downloads to the Printer (5/96)

=====

Article Created: 7 May 1996

TOPIC -----

I have an updated version of a Type 1 PostScript font from Adobe. However, when I print I always get the version in the LaserWriter ROM, not the version on my Macintosh computer. Is there a way to modify the font to have it always download to the LaserWriter printer?

DISCUSSION -----

Modifying TrueType or Adobe Type 1 fonts with ResEdit or similar development tools such as Resourcer is not a trivial task and is not for the faint of heart.

We recommend you either obtain a tool such as Fontographer, or request a font name change be made by Adobe, or perhaps work with a consultant or a knowledgeable programmer to make the appropriate name changes to the font, so that the "new" font gets downloaded. The reason for the name change is it would make the Font appear to the printer to be unique, so it would be downloaded and used. If the Font in question isn't a "ROM" Font, then either the old Font is stored in the printer's hard drive or in the printer's RAM, at which point it is merely a matter to delete the Font from those locations, and download this other Font.

ImageWriter LQ: System 7.5.3 Causes Some Fonts to Shift (5/96)

Revised: 5/7/96
Security: Everyone

ImageWriter LQ: System 7.5.3 Causes Some Fonts to Shift (5/96)

=====

Article Created: 7 May 1996

TOPIC -----

I have an ImageWriter LQ. I recently installed the System 7.5 Update 2.0 on my Power Macintosh 6100 computer, and after the installation certain fonts shift during the second pass of the print head, the top half of the characters are displaced from the bottom half. When I reverted back to System 7.5 everything worked properly. What changed?

DISCUSSION -----

We were able to reproduce the problem on the Power Macintosh 6100, but not a Power Macintosh 7200, so it only seems to occur on some Power Macintosh models. It also only seems to occur when printing in Best mode.

After installing System 7.5 Update 2.0, we checked the Geneva, Palatino, and Helvetica TrueType fonts and they did not change. The issue was most likely introduced in other system software changes such as a possible Font Manager or QuickDraw code change.

Workarounds
=====

- Use QuickDraw GX v1.1.3.
If you use the latest version of QuickDraw GX, the fonts do not shift. There are additional benefits to using QuickDraw GX such as background printing and being able to perform multiple page up (N-up) printing.
- Use landscape orientation.
If you print in the landscape mode, the issue does appear.

Mail*Link for PowerTalk/QM 1.6: ReadMe File (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

This article is the Mail*Link for PowerTalk/QM 1.6 Read Me File.

DISCUSSION -----

Mail*Link for PowerTalk/QM 1.6

This is a personal gateway for PowerTalk users. This gateway will allow PowerTalk users to send and receive mail from their QuickMail accounts without having to login to QuickMail and use the QuickMail DA. Mail can be sent and read with your favorite PowerTalk mail enabled application.

This release of Mail*Link® for PowerTalk™/QM is the first release of this gateway by Apple Computer Inc. This gateway is functionally equivalent to version 1.0.5. Future versions of this software will be modified and enhanced.

This software is licensed to you under the Macintosh System 7.5 license agreement. All terms and conditions of this license must be followed.

NOTE: If you are upgrading from version 1.0.5 or earlier it is VERY IMPORTANT that you follow the instructions in the Upgrading Section below.

The installation and upgrade procedure for this software will still install the StarNine demonstration key files (which were part of the 1.0.5 release). However the 1.6 release of the gateway has been modified to ignore the key files and thus will never expire.

INSTALLATION INSTRUCTIONS
=====

For new installations only:

We recommend that you install this software via the installer script.

1. Double click on either the "Installer" icons.
2. Select the drive on which you wish to install this software.
3. Reboot the system after the software has been properly installed.

UPGRADE INSTRUCTIONS

=====

If you are upgrading from a previous release of Mail*Link PT/QM, you should follow these instructions:

1. Install the software as instructed in the section "INSTALLATION INSTRUCTIONS".
2. After the system has rebooted, open the "PowerTalk Key Chain".
3. Open the QuickMail personal gateway in the key chain. The installation procedures change the file-id that PowerTalk uses to locate the Mail*Link PT/QM file. Opening and closing the QuickMail Service configuration window will cause the new file-id to be written into the PowerTalk configuration file.
4. Close the key chain. You will be told that you must reboot the system before PowerTalk will activate the gateway.
5. Reboot the system.

If you have trouble with the gateway after upgrading please re-install by following the instructions in the Clean Upgrade Install section below.

CONFIGURATION

=====

- Creating your QuickMail personal gateway

Once you have installed the software and rebooted the system (as described above), follow these instructions to create your QuickMail personal gateway.

1. Open the "Key Chain" located on your desktop.
2. Press the "Add" button.
3. You will be presented with a list of services that are available. Select "QuickMail".
4. A new item with the server name of "Not Configured" and a service type of "QuickMail" will appear in your "Key Chain".
5. Proceed to the "Configuring" section below.

- Configuring your QuickMail personal gateway

To configure the QuickMail personal gateway, ensure that the "Key Chain" has been opened.

1. You first need to select your QuickMail directory service. To do this: open the Chooser, choose QuickMessenger, select the directory service and close the Chooser.

2. Double click (Open) the item with a service type of "QuickMail". The QuickMail personal gateway only allows one instantiation, so there should only be one item with this type in the Key Chain window.
3. A configuration window will be displayed. You should configure each item in this window before closing the window. Window closing is equivalent to pressing the "OK" button in a dialog. The "Key Chain" configuration windows have no "Cancel" operation, so please ensure each item is properly filled in before closing the window (you can always come back and change the selections at a later date, but it is better if each item is properly filled in).
4. Once you have entered the information in the configuration window, close the window with a mouse click in the close box or by typing "<command>W". It may take a few seconds for the window to close. This is because PowerTalk is activating all of the personal gateway subsystems and informing them of their new configuration. Be patient.
5. Once the QuickMail configuration window is closed, close the Key Chain window.

CLEAN UPGRADE INSTALLATION

=====

Use this procedure if you are experiencing problems with the gateway software. You should not need to use this procedure for normal installs. To perform a "Clean Install" of the gateway software, use the following procedure.

NOTE: Some gateways may remove mail from your In Tray and Out Tray when they are reinstalled. Be sure to back up any items in your InTray and OutTray by dragging them to another folder on your hard drive.

NOTE: This will remove all services from your keychain, so be sure you have the passwords for these services handy. If you have personal gateways already installed, you will need to set them up again, so be sure you write down the setup information that is contained in each key, if necessary.

This procedure removes all "Mail*Link" gateways. If you have multiple "Mail*Link" gateways installed, you will need to re-install each of the gateways you want to use.

1. Open the Extensions folder, located inside the System Folder. Find the following item(s) and drag to the trash (note only the gateways you have installed will be in the Extensions folder):
Mail*Link PT/QM
Mail*Link PT/MS
Mail*Link PT/INET
2. Open the Preferences folder, located inside your System Folder. Find the following items and drag them to the trash.
StarNine (folder)
PowerTalk Setup Preferences
PowerTalk Startup Preferences
3. Find the "Mail*Link Extras" folder, on the top level of your hard

drive. Drag this folder to the trash.

4. Restart your machine. After you have restarted, choose "Empty Trash" from the Special menu.
5. Double-click the installer for the desired software, and click Install at the Easy Install screen. After the installation is complete, your machine will restart. If you are installing more than one gateway, repeat this step for each gateway.
6. Open the keychain and click "Add". Select the gateway from the list of choices. A new item will be added to the Key Chain. Open this key, and configure the gateway as you normally would. The gateway should now be functioning.

MANUAL INSTALLATION INSTRUCTIONS

=====

The manual installation instructions are for advanced users who wish to build their own installation process or who wish to install only portions of this gateway. Installation using this process should be conducted only after you fully understand how to use your Macintosh, and how to configure and use PowerTalk gateways.

If you must install this version manually, please follow these instructions:

1. Place the distribution diskette in the floppy drive.
2. Open the folder named "Drop Contents on System Folder".
3. Select all of the items in this folder and drag them onto the "System Folder" icon.
4. You will be presented with a dialog box that indicates these files belong in special locations. Click "OK".
5. Close the "Drop Contents on System Folder" folder.
6. Open the folder named "Place Contents in Preferences Folder".
7. Select all of the items in this folder and drag them into the "Preferences" folder (which is located within your "System Folder").
8. If you are presented with a dialog indicating that you will be replacing existing files, click cancel. You should perform the "Automatic Installation" procedure (above).
9. Reboot the system. This is necessary because some of the software installed is only activated at boot time.

NOTE: With version 1.6 it is no longer required to install the key files.

KNOWN INCOMPATIBILITIES

=====

- When forwarding a mail message, the name and address of the original sender of the message is not preserved.
- When forwarding a message, the form content of the forwarded message is lost

unless you type at least 1 character into the forwarded message.

SUPPORT

=====

If you need any additional help installing, configuring or using this gateway
please call Apple Support at: 1 (800) SOS - APPL.

PowerBook: PCMCIA Expnsn Module Replacement Which Sftwr? (5/96)

Revised: 5/7/96
Security: Everyone

PowerBook: PCMCIA Expnsn Module Replacement Which Sftwr? (5/96)

Article Created: 7 May 1996

TOPIC -----

I just got a new Rev. C PCMCIA Expansion module for my PowerBook 500 series computer. Why didn't I get a manual or any documentation? Which version of the PC Card Software do I need to install?

DISCUSSION -----

Some customers will receive the Rev. C PCMCIA Expansion Module through Apple's free upgrade program. Through this program, customers can have an older Rev. A or Rev. B PCMCIA Expansion Module exchanged with a Rev. C module at no cost by calling 800-SOS-APPL or going to an Apple service center.

Rev. C Replacement Modules Are Service Parts

Customers should be made aware that because they are receiving a service part not a Finished Goods part, the Rev. C module will not come with any documentation or software.

Use PC Card Software 2.0 Update ONLY!

*** WARNING ***

Do not attempt to "flash" or update the EPROMs of the Rev. C PCMCIA Expansion Module with PCMCIA Update 1.0 or 1.0.1 software. Doing so downgrades the module and could render it inoperable, requiring a replacement.

The Rev. C PCMCIA Expansion Module requires PC Card Software 2.0. This software can be custom installed from System 7.5.2 (with enabler v1.2 or later) or System 7.5.3. It can also be downloaded from Apple Software Updates sites on the Internet, America Online, CumpuServe and AppleLink.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple

software updates.

- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Downgraded By Mistake?

If you have already downgraded the module's EPROMs by running the older PC Card Software, you will need to have the module replaced by calling 800-SOS-APPL or taking the module to an Apple service center.

Which PC Cards Will Work?

With the new software (2.0) and the Rev. C PCMCIA Expansion Module, you should be able to use PC Cards that worked with previous modules plus certain cards that may not have worked with older modules.

Ejecting a PC Card

The PCMCIA Eject control panel and Control Strip module are not needed with the new software and will not work. To eject a PC Card, make sure that it is not in use. Then drag it to the Trash as you would do with a floppy disk.

MailLink for PowerTalk INET 1.6: ReadMe File (5/96)

Revised: 5/7/96
Security: Everyone

MailLink for PowerTalk INET 1.6: ReadMe File (5/96)

=====

Article Created: 7 May 1996

TOPIC -----

This article is the MailLink for PowerTalk INET Read Me File.

DISCUSSION -----

Mail*Link for PowerTalk/INET 1.6

Mail*Link Internet for PowerTalk is a personal gateway for PowerTalk users. This gateway will allow PowerTalk users to send mail via SMTP and receive mail from a POP3 account. Mail can be sent and read with any PowerTalk mail-enabled application.

This release of Mail*Link® for PowerTalk™/INET is the first release of this gateway by Apple Computer Inc. This gateway is functionally equivalent to version 1.5.1. Future versions of this software will be modified and enhanced.

This software is licensed to you under the Macintosh System 7.5 license agreement. All terms and conditions of this license must be followed.

Upgrade Note: If you are upgrading from version 1.5.1 or earlier it is VERY IMPORTANT that you follow the instructions in the Upgrading Section below.

The installation and upgrade procedure for this software will still install the StarNine demonstration key files (which were part of the 1.5.1 release). However the 1.6 release of the gateway has been modified to ignore the key files and thus will never expire.

It is required that you install and configure MacTCP before using this gateway. See the PT/INET User Guide for more information.

ITEMS OF NOTE
=====

OpenTransport users: This gateway does not function correctly when used with Apple's OpenTransport. The gateway will connect one time but will not reconnect without a reboot. Apple is currently investigating problem.

INSTALLATION INSTRUCTIONS

=====

For new installations only:

We recommend that you install this software via the installer script.

1. Double click on either the "Installer" icon.
2. Select the drive on which you wish to install this software and click Install.
3. Reboot the system after the software has been properly installed.

UPGRADE INSTRUCTIONS

=====

If you are upgrading from a previous release of Mail*Link Internet for PowerTalk, you should follow these instructions:

1. Install the software as instructed in the section "INSTALLATION INSTRUCTIONS".
2. After the system has rebooted, open the "PowerTalk Key Chain".
3. Open the PT/Internet personal gateway in the key chain. The installation procedures change the file-id that PowerTalk uses to locate the Mail*Link PT/INET file. Opening and closing the PT/Internet Service configuration window will cause the new file-id to be written into the PowerTalk configuration file.
4. Close the key chain. You will be told that you must reboot the system before PowerTalk will activate the gateway.
5. Reboot the system.

If you have trouble with the gateway after upgrading please re-install by following the instructions in the Clean Upgrade Install section below.

CONFIGURATION

=====

- Creating your PT/Internet personal gateway

Once you have installed the software and rebooted the system (as described above), follow these instructions to create your PT/Internet personal gateway.

1. Open the "Key Chain" located on your desktop.
2. Press the "Add" button.
3. You will be presented with a list of services that are available. Select "PT/Internet".

4. A new item with the server name of "Not Configured" and a service type of "PT/Internet" will appear in your "Key Chain".
 5. Proceed to the "Configuring" section below.
- Configuring your PT/Internet personal gateway

To configure the PT/Internet personal gateway, ensure that the "Key Chain" has been opened.

1. Double click (Open) the item with a service type of "PT/Internet". The PT/Internet personal gateway only allows one instantiation, so there should only be one item with this type in the Key Chain window.
2. You should configure each item in this window before closing the window. Window closing is equivalent to pressing the "OK" button in a dialog. The "Key Chain" configuration windows have no "Cancel" operation, so please ensure each item is properly filled in before closing the window (you can always come back and change the selections at a later date, but it is better if each item is properly filled in).
3. To finalize configuration YOU MUST select the preferences button on open the PT/INET Preference dialog. Change any preferences you need to (it is not necessary to change any) and close the window.
4. Once you have entered the information in the configuration window, close the window with a mouse click in the close box or by typing "<command>W". It may take a few seconds for the window to close. This is because PowerTalk is activating all of the personal gateway subsystems and informing them of their new configuration. Be patient.
5. Once the PT/Internet configuration window is closed, close the Key Chain window.

CLEAN UPGRADE INSTALLATION

=====

Use this procedure if you are experiencing problems with the gateway software. You should not need to use this procedure for normal installs. To perform a "Clean Install" of the gateway software, use the following procedure.

NOTE: Some gateways may remove mail from your In Tray and Out Tray when they are reinstalled. Be sure to back up any items in your InTray and OutTray by dragging them to another folder on your hard drive.

NOTE: This will remove all services from your keychain, so be sure you have the passwords for these services handy. If you have personal gateways already installed, you will need to set them up again, so be sure you write down the setup information that is contained in each key, if necessary.

This procedure removes all "Mail*Link" gateways. If you have multiple "Mail*Link" gateways installed, you will need to re-install each of the gateways you want to use.

1. Open the Extensions folder, located inside the System Folder. Find the following item(s) and drag to the trash (note only the gateways you have installed will be in the Extensions folder):

Mail*Link PT/QM
Mail*Link PT/MS
Mail*Link PT/INET

2. Open the Preferences folder, located inside your System Folder. Find the following items and drag them to the trash.
StarNine (folder)
PowerTalk Setup Preferences
PowerTalk Startup Preferences
3. Find the "Mail*Link Extras" folder, on the top level of your hard drive. Drag this folder to the trash.
4. Restart your machine. After you have restarted, choose "Empty Trash" from the Special menu.
5. Double-click the installer for the desired software, and click Install at the Easy Install screen. After the installation is complete, your machine will restart. If you are installing more than one gateway, repeat this step for each gateway.
6. Open the keychain and click "Add". Select the gateway from the list of choices. A new item will be added to the Key Chain. Open this key, and configure the gateway as you normally would. The gateway should now be functioning.

MANUAL INSTALLATION INSTRUCTIONS =====

The manual installation instructions are for advanced users who wish to build their own installation process or who wish to install only portions of this gateway. Installation using this process should be conducted only after you fully understand how to use your Macintosh, and how to configure and use PowerTalk gateways.

If you must install this version manually, please follow these instructions:

1. Place the distribution diskette in the floppy drive.
2. Open the folder named "Drop Contents on System Folder".
3. Select all of the items in this folder and drag them onto the "System Folder" icon.
4. You will be presented with a dialog box that indicates these files belong in special locations. Click "OK".
5. Close the "Drop Contents on System Folder" folder.
6. Open the folder named "Place Contents in Preferences Folder".
7. Select all of the items in this folder and drag them into the "Preferences" folder (which is located within your "System Folder").
8. If you are presented with a dialog indicating that you will be replacing existing files, click cancel. You should perform the "Automatic Installation" procedure (above).
9. Reboot the system. This is necessary because some of the software installed is only activated at boot time.

NOTE: With version 1.6 it is no longer required to install the key files.

KNOWN INCOMPATIBILITIES

=====

- When a mail message is forwarded, the name and address of the original sender are not preserved.
- CE Software's QM for AOCE may be used to send mail, although you must select the AppleMail format when sending the message. This application may NOT be used as the default mail reader. If it is selected, AppleMail will be used instead.

SUPPORT

=====

If you need any additional help installing, configuring or using this gateway please call Apple Support at: 1 (800) SOS - APPL.

Global Village: AT Command Set (5/96)

Revised: 5/8/96
Security: Everyone

Global Village: AT Command Set (5/96)

Article Created: 8 May 1996

TOPIC -----

This article describes AT commands and the general Global Village command list. This information is from the Global Village Platinum V Users Guide.

DISCUSSION -----

Usually your telecommunications application controls and configures your telecommunications card (the modem). However, you can also control and configure most modems - including your telecommunications card - using a "language" called the AT command set.

You control and configure your telecommunications card from within a telecommunications application. You can enter an AT command to "tell" your telecommunications card to perform a variety of tasks, such as dialing or answering the telephone. For example, to get the telecommunications card's attention and ask it to dial a phone number such as "123-4567," enter the following command line:

```
ATDT 123-4567
```

Today, many Macintosh telecommunications applications contain options for dialing, terminal emulation, and file transfer using menu commands that are in plain English. However, in many telecommunications applications, the AT command line appears on your screen after you choose the menu command.

Uses for AT Commands

AT commands have a number of uses. You can use AT commands to connect to a certain type of modem. You can also use AT commands in scripts. A script is a set of AT commands you use to perform a certain function. You often use scripts to automate common activities, such as logging to an on line service.

Command state and On-line State

When the telecommunications card is on, it is always in one of 2 states: the command state or the On-line State. The telecommunications card assumes the command state when power is turned on. In the command state, AT commands are sent to the telecommunications card to control all aspects of its operation. After your telecommunications card connects with a remote modem, both the telecommunications card and the modem are in the on-line state. All information you send to you telecommunications card is sent to the remote modem as well.

Command Buffer

The command buffer is the area in which you enter At commands. The command buffer capacity for the telecommunications card (platinum V) is 39 characters. If the command line exceeds the command buffer capacity, the telecommunications card will not execute the command line and will send an ERROR message after the carriage return. If you exceed the character limit, re-enter the command with fewer than the allowed number of characters so that the command line can be executed.

You can enter telephone numbers with or without punctuation: for example: (123) 456-7890 or 1234567890

Punctuation in the telephone number takes up space in the command buffer. Note that the AT command characters, the space character, the carriage return control character, and the line feed (LF) control character are not stored in the command buffer.

AT Command Components

The following sections discuss the key components of an AT command.

- Attention Code

You must begin command lines with the characters "AT" and enter them as all uppercase (AT) or all lowercase (at) characters. The attention code (AT) gets the telecommunications card's attention and indicates that the text following the AT command is a command that the telecommunications card should act on. The following is a sample command in which you instruct the telecommunications card to hand up: ATH0

- Command Parameters

Most AT commands have parameters - single-digit or double-digit options - that follow the command letter. Each command has a default parameter. The default parameter is used if no parameter is specified. For example, the "Hn" command has 2 parameters: 0 and 1. The command defaults to 0 if no parameter is specified. Therefore, typing ATH is equivalent to typing ATH0.

- Return Key

You must end the command line with a carriage return. Press the Return Key to enter a carriage return. The telecommunications card begins executing a command when it receives a carriage return.

- Delete Key

Before executing a command by pressing the Return key, you can edit the command

using the Delete key. The Delete key cannot erase the AT at the beginning of the command line.

General Global Village Command list

Begin_Table

Command	Meaning
ATDT phone nu	ATDT and a telephone number dials a telephone number using a touch tone dialing.
ATE1	Ensures that commands you send to the telecommunications card appear on your screen when you type them.
ATH0	Hangs up the line.
ATM0	Turns off the modem speaker.
ATLM1	Turns on the modem speaker while dialing until connection is established.
ATX1	Ignores the dial tone when dialing a number.
ATV1	Displays verbal results codes, such as RING, CONNECT, OK, and NO CARRIER.
ATZ	Resets the telecommunications card to its power-on configuration.
AT&F1	Resets the telecommunication card for optimal high-speed connections.
ATDP	ATDP and telephone number dials the phone number using pulse Dialing.

- Teleport Gold II, Gold IIv and Platinum V

ATL1 Sets the speaker volume to low.

End_Table

Network Server: SMIT, AppleTalk Admin Tool Function Keys (5/96)

Revised: 5/8/96
Security: Everyone

Network Server: SMIT, AppleTalk Admin Tool Function Keys (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

How can I run SMIT with the CommandShell AppleTalk Administrative Tool on the Network Server 500 or Network Server 700?

The default VT-102 tool only gives me F1 through F4 function keys does not let me manipulate SMIT. I tried the VT-320 tool with MacTerminal which I did have working with ClarisWorks and a serial connection to the server, but I could not get the same settings for VT-220 emulation to work in CommandShell.

How do I get other function key functions?

DISCUSSION -----

There is a built-in alternative to the function keys.

You can use the sequence "Escape Key - Number Key".

This will let you navigate the different menus in SMIT while in a terminal emulation session from the CommandShell windows, Text based Console Window, Telnet session, and so on.

For example, from the CommandShell window, if you need to enter F4 (Function Key 4) to generate a list of options for a field, you can enter the sequence Esc 4 (Escape key - Number 4 key) and obtain the same result.

Apple OneScanner 600/27: Creating Electronic Forms (5/96)

Revised: 5/8/96
Security: Everyone

Apple OneScanner 600/27: Creating Electronic Forms (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

I want to scan in a form using the Apple OneScanner 600/27, then type over the top of the electronic version of the form. Does the Apple OneScanner 600/27 software convert the text of the form, but leave the lines and other artwork alone?

DISCUSSION -----

You can scan with the OneScanner Dispatcher software an image or document, then add text or edit graphics before archiving the document for later retrieval. Added text to the image may be later converted to text using the bundled TextBridge OCR software.

You can also use TextBridge to scan and convert hard copy directly, or with TextBridge, open and convert existing on-line (electronic) images into formatted text files. TextBridge OCR Software output options include Text, Page Image, or Both:

- If you want to capture and convert only the Text, select Text.
- Choose Page Image to only output page images.
- Click Both to create a text and a page image file. Use your text editor or page layout program to manipulate the text file, or a graphics package to manipulate or extract any illustrations from the image file. In the case of a form (a type of image), you will be able to modify the image with a graphics application. The Both output, however, does not create a single document containing editable graphic and text elements: you'll need text and graphic applications to recombine the graphic and text elements while allowing discrete graphic and text edit control.

An Auto Zone feature recognizes pages that have more than one column and/or unusual layouts and outputs the recognized text in the proper order. You can

preview and manually override any automatic zones.

The Tech Info Library article titled "Color OneScanner 600/27: Dispatcher Software Description" contains a complete description and functions of the software.

PCI-based PC Compatibility Cards Video Capabilities (4/97)

Revised: 4/8/97
Security: Everyone

PCI-based PC Compatibility Cards Video Capabilities (4/97)

=====

Article Created: 8 May 1996
Article Reviewed/Updated: 8 April 1997

TOPIC -----

What are the video capabilities of the PCI-based PC Compatibility Cards?

DISCUSSION -----

Both the 7-inch and the 12-inch cards have 1 MB built-in video memory (VRAM) for the following capabilities:

Begin_Table

Resolution	Max Colors
-----	-----
640x480	16.7 million
800x600	65,536
1024x768	256
1152x864	256

End_Table

The 12-inch card also has two sockets to increase video DRAM to 2 MB. These sockets accommodate 5V, 256K x 16, 60 ns, standard fast-page mode SOJ package DRAM devices (40 pin), such as Micron #MT4C16257DJ-6, NEC #UPD424260LE60R, Samsung #KM416C256BJ-6, or Hyundai #HY514260BJ-60.

These are the maximums with 2 MB video memory (VRAM) for the 12-inch card:

Begin_Table

Resolution	Max Colors
-----	-----
640x480	16.7 million
800x600	16.7 million

1024x768	65,536
1152x864	65,536
1280x1024	256

End_Table

A multiple-scan monitor is required to reach some resolution/color depth combinations. For particular resolutions/color depths, the monitor must support the resolution at refresh rates that are indicated in Appendix C of your PC Compatibility Card User's Manual.

Article Change History:

08 Apr 1997 - Edited for technical accuracy.

16 Sep 1996 - Added VRAM to text for searchability.

Newton Keyboard: Uppercase Keys Don't Work (5/96)

Revised: 5/8/96
Security: Everyone

Newton Keyboard: Uppercase Keys Don't Work (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

I have a Apple MessagePad with the Newton Keyboard. All the lowercase keys work properly, but not all the uppercase worked. I tried to use the caps lock and the shift key, but they resulted in lowercase characters.

DISCUSSION -----

When this happens you should reset your Apple MessagePad. Do not perform a hard reset. If you perform a hard reset any information in the internal memory are lost.

Resetting Your Apple MessagePad

=====

Step 1

Remove the battery cover

Step 2

With a pencil or pen, press the button next to the word RESET.

DO NOT use the pen that came with your Apple MessagePad.

Apple MessagePad: Default System Dates (5/96)

Revised: 5/8/96
Security: Everyone

Apple MessagePad: Default System Dates (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

I am trying to create a new not on an Apple MessagePad 120. When I draw a line underneath an existing note, the line disappars and a new note does not show on the screen.

DISCUSSION -----

Either scroll up, or look at the notes overview for the new notes. If you performed a hard reset and did not set the date, new notes appear before any existing notes.

Below is a table which shows the default system date and time settings.

Begin_Table

MessagePad Model	Default System Date and Time	Default Note Date
Original MP	1 Jan 1993 12:00 PM	1/1/93 11:00 AM
100 w/1.3 OS	3 Jan 1994 12:00 PM	1/3/94 11:00 AM
110 w/1.3 OS	3 Jan 1994 12:00 PM	1/3/94 11:00 AM
120 w/1.3 OS	3 Jan 1994 12:00 PM	1/3/94 11:00 AM
120 w/2.0 OS	4 Nov 1995 03:00 AM	11/4/95 03:01 AM
130 w/2.0 OS	1 Nov 1995 02:08 PM	11/1/95 02:08 PM

End_Table

When setting the clock, you should first check the Time Zones for the correct setting. The default setting is the Pacific Time zone.

Apple Video Player: Remote Control Doesn't Work (10/96)

=====

Article Created: 8 May 1996
Article Reviewed/Updated: 17 October 1996

TOPIC -----

I have a Macintosh Performa 638CD, and I just installed System 7.5 Update 2.0. However, since doing so I can no longer use the remote control which was included with my computer. It worked fine before I installed the update. What is causing this?

DISCUSSION -----

Apple has duplicated this issue, but it appears to occur only when using the Apple Video Player; the remote control works fine when using other applications, such as adjusting the volume for the CD-ROM drive. Apple has resolved this issue with System 7.5.5 Update, which is available on the online services.

If you have not yet installed System 7.5.5 Update, this issue can be temporarily resolved by deleting the Apple Video Player Prefs file, which is in the Preferences folder within the System Folder. However, once you use the remote control with the Apple Video Player again, the issue will return. So, the best solution is to not use the remote control in Apple Video Player until you update to System 7.5.5 Update.

The following computers have a built-in infrared sensor which allow them to be controlled remotely and may be affected by this issue:

- The Macintosh 630CD family: Macintosh LC 630, Quadra 630, Performa 630, Performa 631, Performa 635, Performa 636, Performa 637, Performa 638, and Performa 640.
- The Macintosh 5200CD family: Macintosh 5200/75 LC, Performa 5200, Performa 5210, Performa 5215, and Performa 5220.
- The Macintosh 6200CD family: Performa 6200, Performa 6214, Performa 6216,

Performa 6218, Performa 6220, and Performa 6230.

- The Macintosh Performa 5300CD, Power Macintosh 5260/100 and Power Macintosh 5300/100 LC
- The Macintosh Performa 6300CD series: Performa 6300 and 6290

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article was published in the Information Alley on 23 September 1996.

Apple LaserWriter Printers: Models Supporting Apple II (5/96)

Revised: 5/8/96
Security: Everyone

Apple LaserWriter Printers: Models Supporting Apple II (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

This article contains a list of LaserWriter models supporting the Apple II computer series.

DISCUSSION -----

In order for an Apple LaserWriter to work with an Apple II system, the LaserWriter hardware needs to support Diablo (straight text) mode. Diablo mode allows the printer to understand text data from the Apple II and convert that data into a printed page. The Apple LaserWriters supporting hardware Diablo mode are the:

LaserWriter (original model)
LaserWriter Plus
LaserWriter IINT
LaserWriter IINTX
Personal Laserwriter NT

To put the LaserWriter hardware in Diablo (straight text) mode, do the following:

Begin_Table

+=====+	
Model	What to do for Diabo mode
+=====+	
LaserWriter	Change dial on back of LaserWriter
	to SPECIAL
+-----+	
LaserWriter Plus	Change dial on back of LaserWriter
	to SPECIAL
+-----+	
LaserWriter IINT	Dipswitch 1 = UP

	Dipswitch 2 = Down	
+-----+		
LaserWriter IINTX	Dipswitch 2 = UP	
	Dipswitch 3 = UP	
	ALL Others = DOWN	
+-----+		
Personal LaserWriter NT	Change pinwheel dial to Setting 3	
+-----+		

End_Table

Apple MessagePad 130: Memory Allocation Amounts (5/96)

Revised: 5/8/96
Security: Everyone

Apple MessagePad 130: Memory Allocation Amounts (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

This article provides a breakdown on the memory allocation on the Apple MessagePad 130 device.

DISCUSSION -----

Built-in applications: Calculator, Calls, Card, Clock, Connection, Formulas, Help, In Box, Out Box, Owner Info, Prefs, Setup, Styles, Time Zones, and Writing Practice,

Also loaded into internal memory are:

Hide-E	2K
HW Instructor	101K
Newton Tour	110K
Pocket Quicken	238K
Serial 9600	1K

Total	452
Soups	7
Patches (approx.)	33

Total	492K

1K allotments are initially set aside for the Calls, Dates, In/Out Items, Names, Notes, Pocket Quicken and To do Task soups adding up to another 7K. Everytime you add a note, or name, these amounts increase and take up more user memory.

Memory Info shows 492K used and 869K free, this gives you 1361K user available memory. Since the 869K free initially may be startling, you can gain some of that space back by removing those packages that are preloaded into the internal memory: HW Instructor, Newton Tour, Pocket Quicken, or Serial 9600.

Just as with any computer, when the operating system loads, it takes away from the operational memory. In the case of the Apple MessagePad, the operating system, the system updates (patches) load in at about 639K. As for the extra 512K, you should never even be aware of its existence unless you looks at the Memory Info stats. This is a result of how smoothly the heap space operations are now handled.

PowerBook 5300: GlobalFax Error Message (5/96)

=====

Article Created: 8 May 1996

TOPIC -----

When I start my PowerBook 5300 series computer I get an error message that says the GlobalFax software has encountered an error.

DISCUSSION -----

Step 1

Open Extensions Manager Control Panel and select the set All Off from the pop-up menu. Then select the extension Macintosh Easy Open (MEO).

Step 2

Restart the computer from the Special menu rebuild the desktop by holding down the Option and Command keys until you get the message which asks do you want to rebuild the desktop. Click OK.

Step 3

Open Extensions Manager Control Panel and select the set All On. Restart using the Special menu.

Step 4

If you still get the GlobalFax error, remove the existing Global Village software (Use the Custom Remove feature of the Global Village Installer) and then reinstall the software.

WorkGroup Server Solution Companion CD 2.0: What's On it (5/96)

=====

Article Created: 9 May 1996

TOPIC -----

This article contains a list and description of the applications on the WorkGroup Server Solution Companion 2.0 CD-ROM disc.

DISCUSSION -----

The WorkGroup Server Solution Companion 2.0 CD-ROM disc consists of:

- Acrobat Reader: Adobe Systems Document Reader
- FileWave: Automated file / data distribution
- Viper: File look-up utility
- Contact & Up-to-Date: Contact management, calendar
- 4-Sight fax server: Send/receive, e-mail integration
- netOctopus: Asset management (Mac & PC)
- Skyline / Satellite: Network bandwidth monitor
- Virex: Antivirus utility

• Datawatch (508/988-9700), which sells Virex antivirus software, recently obtained U.S. marketing rights to netOctopus, a network- and system-administration package developed by Germany-based Pole Position Software. Like Saber LAN Workstation, netOctopus can be used to distribute software electronically. Datawatch is supporting existing netOctopus customers, and the company promises a major revision of netOctopus later this year. An interim release, due in July, will allow remote users to run database updates, virus scans, software inventories, and similar functions automatically when they log on. netOctopus costs between \$30 and \$47 per workstation.

CLW 12/600 PS: Cyan Yellow Magenta Startup Page (10/96)

Revised: 10/23/96
Security: Everyone

CLW 12/600 PS: Cyan Yellow Magenta Startup Page (10/96)

=====

Article Created: 8 May 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

My Color LaserWriter 12/600 PS printer produces a 1/2 magenta, 1/4 yellow and 1/4 cyan page whenever I power on the printer. I have turned off both of the startup pages with the Apple Printer Utility, but this three color page still comes out. I am connecting using a peripheral 8 serial cable for my connection.

DISCUSSION -----

Examine the serial cable. If any of the pins are bent, this can cause the printer to think that a special loopback test plug is installed. The loopback plug places the printer into an extended diagnostic mode which produces the three color page you have described. This also happens on the Color LaserWriter 12/660 PS printer.

Power down the printer, then remove the serial cable. Then power the printer back on. You should not see the three color diagnostic page. If removing the cable solves this issue, you need to replace the cable, or carefully bend the pins back into position. However, if after removing the cable you are still getting the three color diagnostic page, you should get your Color LaserWriter 12/600 PS printer serviced.

Article Change History:
23 Oct 1996 - Added Color LaserWriter 12/660 PS to article.

Performa 640 DOS Compat: DOS Software Isn't Reinstalled (5/96)

Revised: 5/9/96
Security: Everyone

Performa 640 DOS Compat: DOS Software Isn't Reinstalled (5/96)

=====

Article Created: 9 May 1996

TOPIC -----

I have a Performa 640 DOS Compatible computer, and I had to reinstall my system software recently. Now that I have reinstalled the system software, I cannot find the PC Setup control panel.

DISCUSSION -----

The DOS Compatibility Installer for the Mac Environment disk is not shipped with the Performa 640 series DOS Compatible. When you reinstall the system software from the CD-ROM disc, the software required to operate the DOS Compatibility Card is not installed. To use your DOS Compatibility Card again, you need to manually drag the files from the CD-ROM disc to your System folder on your hard disk.

The path to locate these DOS resources on the CD are:

Performa CD -> Hard Disk Files -> System Folder Files -> Extensions to get the following:

PC Clipboard (V 1.0.5)
PC Clipboard Translators (V 1.0.5)
PC Network Extension (V 1.0.5)
PC Print Spooler (V 1.1.1)
PC Setup Guide Additions (V 1.1)

Performa CD -> Hard Disk Files -> System Folder Files -> Control Panels to get the following:

PC Setup (V 1.0.5)

The Preferences folder contains both PC Setup Preferences and Spooler folder, but these can be left out since they are automatically recreated.

Color STW 2400: Freezes in Landscape mode w/VM ON (5/96)

=====

Article Created: 9 May 1996

TOPIC -----

We have a Power Macintosh 6100/66 running System 7.5.3 and a Color StyleWriter 2400. When printing color output to our Color StyleWriter 2400 in landscape mode, our computer freezes after Desktop PrintMonitor shows that 28% is complete. The problem does not occur if we:

- Select Black & White.
- Print in portrait mode.
- Disable background printing.
- Disable Virtual Memory.

We are using the Color StyleWriter 2400 v2.1.1 driver.

DISCUSSION -----

There are some known issues when printing to the Color StyleWriter 2400 with Virtual Memory enabled. The problem as outlined above is resolved with the Color StyleWriter 2500 software (v2.2) which is backward compatible with the Color StyleWriter 2400. We would suggest that all customers experiencing any software-related problems with their Color StyleWriter 2400, upgrade to the new software.

PCI-Based Power Macintosh Computers: UL Listing? (5/96)

Revised: 5/9/96
Security: Everyone

PCI-Based Power Macintosh Computers: UL Listing? (5/96)

=====

Article Created: 6 May 1996

TOPIC -----

Are the PCI-based Power Macintosh computers UL (Underwriter Laboratories)
Listed?

DISCUSSION -----

Apple Computer Inc. uses the testing services of the Canadian Standards Association (CSA). The CSA is recognized by the Occupational Safety and Health Administration (OSHA) as a Nationally Recognized Testing Laboratory (NRTL).

OSHA created a set of standards for approving companies or agencies that do electrical and safety testing. These procedures for certifying a company as an NRTL mean that there can now be more than one source for testing. This allows vendors other than UL to be qualified as OSHA-recognized testing labs.

The insignia for CSA is on the PCI-based Power Macintosh computers, which shows that they are recognized by an NRTL. The /c means that they are also certified for Canada.

Additional information on OSHA's procedures is available on OSHA's web site at <http://www.osha-slc.gov/>.

Network Server AIX: CDE and Slow Startup (5/96)

=====

Article Created: 9 May 1996

TOPIC -----

When I log into the CDE environment of AIX on my Network Server, CDE appears to take a long time to get past the blue screen. The desktop will finally appear, but this can take 15 minutes. My system is properly registered with the DNS Server. As a side note, I am unable to ping loopback.

DISCUSSION -----

If you are configuring your system to use DNS for host resolution, AIX defaults to using DNS resolution before using /etc/hosts. CDE depends on the host name & IP address assigned to properly function, but during the login sequence, your system is querying the DNS server. To speed up the login sequence, and to let you resolve names in the host file prior to requesting them from DNS, create a file called /etc/netsvc.conf, and add this line:

```
hosts=local, bind.
```

This will allow AIX to resolve your hostname for CDE and improve login time

System 7.5.3: No Translucent Icons Available on Monitor (5/96)

=====

Article Created: 9 May 1996
Article Reviewed/Updated: 23 May 1996

TOPIC -----

I have a PowerBook 5300 with an built-in grayscale monitor and I just upgraded to System 7.5.3. The System 7.5 Update 2.0 Read Me files say there is a new "translucent dragging" feature for PowerPC-based computers, but I do not seem to have this feature. Why not?

DISCUSSION -----

Because translucent dragging mixes the color of the first icon being dragged with any grays or colors in the background that it is being dragged over, a palette of at least 256 grays or colors is required to make the feature work. If you set the Monitors control panel to a bit-depth below 256 grays or colors, the icons will not be translucent when dragged, they will simply be outlined.

Because the grayscale version of the PowerBook 5300/100 computer* is only capable of displaying 4-bit (16 shades) of gray on the internal monitor, it cannot display the translucent dragging feature. If an external monitor with greater than 256 grays or colors is connected, the feature will work on that external monitor.

NOTE:

*All other models of the PowerBook 5300 series computers are capable of translucent dragging.

PowerBook 180c: Won't Power Up Properly (12/96)

Revised: 12/9/96
Security: Everyone

PowerBook 180c: Won't Power Up Properly (12/96)

=====

Article Created: 9 May 1996
Article Reviewed/Updated: 9 December 1996

TOPIC -----

My PowerBook 180c will not always fully power on. It gets a startup chime and I see the screen for a few seconds and then it just shuts down. I have reset the power manager, but that did not correct it. I have a good AC adapter that I checked with my PowerBook 165c. If I charge the battery, it will eventually start the unit, but it will not start with just the AC Adapter.

DISCUSSION -----

You need to make sure you are using the proper AC adapter. If your PowerBook 180c has a modem and a large RAM card, it may require more power than most AC adapters provide. The PowerBook 180c requires a 24W AC adapter. The proper Apple AC adapter can be identified by the Model number M5652, and reads 24W on the AC Adapter tip. If you are using any other AC Adapter and your battery is low, then your PowerBook will not always startup properly without a fully charged battery.

Macintosh 5200/5300/6200/6300: Repair Extension Program (1/97)

Revised: 1/17/97
Security: Everyone

Macintosh 5200/5300/6200/6300: Repair Extension Program (1/97)

Article Created: 9 May 1996
Article Reviewed/Updated: 17 January 1997

TOPIC -----

The pointer on the screen of my Power Macintosh 5200/75 computer seems to freeze when I am working in different applications. The color hue also seems to change over time. What can I do?

DISCUSSION -----

Apple has identified the causes for the issues you describe and has created a Repair Extension Program to address them. This is NOT a product recall. Rather, it is a program designed to resolve the sporadic freezing and color hue changes on your computer.

Quality is a top priority at Apple, and this repair program addresses certain quality issues that have surfaced with these products. Apple is putting these repair programs in place as part of the company's goal to provide a high level of customer satisfaction.

ISSUES ADDRESSED

=====

The Repair Extension Program for Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers addresses two key quality issues:

- 1) System freezes caused by specific, known component issues that have been identified by Apple.
- 2) Sudden or intermittent changes in the monitor's color hue on Power Macintosh and Performa 5200 and 5300 series computers due to a particular cable.

MODELS INCLUDED

=====

- Power Macintosh 5200/75 LC, 5300/100 LC
- Macintosh Performa 5200, 5215, 5300
- Macintosh Performa 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290, 6300

*Note:

The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.

REPAIRS INCLUDED IN PROGRAM

=====

The Repair Extension Program will include some or all of the following, as appropriate, for a particular computer:

- Check the logic board and replace as appropriate.
- Check revision of the unit and replace a cable to correct the sudden or intermittent changes in color hue.

IMPORTANT NOTES

=====

- System freezes or video issues can occur for reasons unrelated to the component problems described above. Any such issues would not be covered by this Repair Extension Program.

- If your computer is affected by either of the two specific issues identified above, call 1-800-SOS-APPL (in the United States) or contact an Apple-authorized service provider (outside the United States) to schedule your system for repair.

- This program will remain in effect for 7 years.

This article was published in the Information Alley on 9 May 1996.

Network Server 500 & 700: Licensed AIX Logins

Revised: 5/10/96
Security: Everyone

Network Server 500 & 700: Licensed AIX Logins

=====

Article Created: 10 May 1996

TOPIC -----

AIX Licensed Logins, counted and non-counted logins.

DISCUSSION -----

There are several ways to access the AIX Version 4.1 BOS, some of which are controlled by the AIX user license. An AIX Version 4.1 user license is required for a user to access the system with the following methods:

- Logins provided via a getty (from an active, local terminal)
- Logins provided using the rlogin or rsh -l command
- Logins provided using the telnet or tn command
- Logins provided through the Common Desktop Environment (CDE)
- Logins provided using Apple's CommandShell remote AppleTalk client

Any other way of accessing the AIX Version 4.1 BOS does not require AIX user licenses (for example: ftp, rexec, rsh without the -l flag, nfs).

Third-party applications may implement their own user or other license restrictions.

QuickTime 2.5: Features & Enhancements (9/96)

Article Created: 10 May 1996
Article Reviewed/Updated: 30 September 1996

TOPIC -----

This article describes new features and enhancements for Apple Quicktime 2.5.

DISCUSSION -----

On Monday April 15, the QuickTime team announced enhancements to QuickTime for video professionals at the National Association of Broadcasters (NAB) conference in Las Vegas. Although announced on 15 April 1996, these updates are still under development and will not be available for distribution until mid May 1996 (WWDC timeframe). QuickTime 2.5 replaces QuickTime 2.1 for Macintosh and provides several performance enhancements as well as bug fixes that primarily impact developers and content authors, including:

QUICKTIME 2.5

QuickTime v2.5 is a reference release for Macintosh and is fully compatible with today's QuickTime content. It provides several new features and enhancements:

- Improved performance, better quality movie playback
- Improved MIDI/music support
- Multi-processing and PCI card support
- Closed-Caption text capture support
- Improvements to overall reliability through numerous bug fixes in the core QuickTime extensions
- Better performance movie playback

QuickTime's primary data handler has been updated to allow for higher

performance playback. The data handler has been modified to maximize throughput resulting in noticeable performance improvements.

- Native Component Manager dispatching mechanism

A new Component Manager provides a more efficient, fully Power PC native path for QuickTime video, sound, music and as well as other Component Manager clients such as ColorSync, QuickDraw GX, Sound Manager, AppleScript, Macintosh Easy Open and the Display Manager. These enhancements provide better movie playback performance as well as overall better system performance.

- Asynchronous JPEG and Raw codecs on Power Mac

The JPEG and Raw codecs are now asynchronous allowing QuickTime to continue processing data while the codecs simultaneously compress or decompress video.

- Public API and format for software synthesizers and musical instruments (MIDI)

QuickTime 2.5 has music capabilities that make it possible for developers to bring a unique music experience to multimedia titles while taking advantage of the MIDI standard. QuickTime 2.5 provides developers the ability to create their own distinctive, custom software synthesizers and libraries of musical instruments and sounds. QuickTime 2.5 introduces a public API and format for adding these synthesizers and instruments using the QuickTime Music Architecture (QTMA). These sounds may be embedded in a QuickTime movie, passed via a call to QuickTime, or dropped into the System Folder.

Third parties such as InVision, Roland, Yamaha, and others can now sell and/or license instruments and instrument libraries to developers and musicians. With the introduction of this enhancement to the QTMA, these instruments and instrument libraries are to developers and musicians, what fonts are to desktop publishers and graphic artists.

- Support for QuickDraw 3D / Tweening media handler

QuickTime 2.5 includes support for Apple's QuickDraw 3D technology. With this addition, 3DMF objects can be put into a 3D track and synchronized with other media types, such as video and music. Going forward QuickTime will support controls so users will be able to interact with these 3D objects by simply "grabbing" the object.

- PCI acceleration support / Multi-processor support

QuickTime 2.5 includes new API hooks that enhance the ability of hardware vendors to improve QuickTime performance through hardware acceleration. Examples include new PCI video accelerator cards from ATI and Diamond Multimedia for improved playback performance - regardless of the size the movie was originally captured and digitized at. Cards such as the Daystar Genesis multi-processor card will greatly increase creation and authoring performance.

- Support for Closed-Caption in the capture APIs

A new sequence grabber channel is now available. Along with video, sound, and music channels, closed-captioned text can be captured and embedded into a QuickTime movie's text track. This allows for fast searching and cataloging of stored media. Just as the video grabber digitizer components have been written for specific hardware, the text grabber calls components that supply text. QuickTime 2.5 uses a component that works with an Apple TV Tuner card. It converts the closed-captioned data into text data for a text track.

- Enhanced text import/export descriptors

Editing text in movies is now easier. The import/export text components now work with text descriptors and timeStamps. Text descriptors are just that, descriptions of the text that follows. TimeStamps make it simple to do repeated export-edit-import tasks. The timeStamp keeps track of the starting time and duration of the sample, thus keeping the samples in sync with other media in the movie.

- Better support for low data rate audio capture

The sequence grabber sound channel has been enhanced to allow sound to be captured at any sample rate. This feature is important to network video conferencing solutions such as Apple's QuickTime Conferencing technology. The user interface in the sequence grabber sound sample panel has been updated for this feature. If 8k is not present in the sound input driver's native rates, 8k is added to the rate pop-up.

- Sprite enhancements

Both the Sprite Toolbox and the Sprite Track in QuickTime 2.5 now support graphics modes. This allows for sprites to blend with the background in various ways. Of particular interest is the ability to use 32 bit animation compressed sprites with an alpha channel graphics modes.

- Clock component

A new Clock component now guarantees enhanced synchronization of video and sound, and simplifies the problem of synchronizing these data types across the diverse array of sound and video hardware configurations supported by QuickTime.

- CD AutoStart for audio CDs

The AutoStart feature enables multimedia developers to create CD-ROMs that automatically start up when the disc is inserted. QuickTime 2.5 now extends this feature to standard audio Compact Discs which will begin playing when mounted.

System 7.x: RAM Disk & Startup With Extensions Off (5/96)

Revised: 5/10/96
Security: Everyone

System 7.x: RAM Disk & Startup With Extensions Off (5/96)

Article Created: 10 May 1996

TOPIC -----

When I'm using a RAM disk and I startup with the extensions turned off, sometimes I get a message asking me if I want to initialize the RAM disk. If I hit Cancel, the message keeps coming back. What should I do? I do not want to lose any data that might be on the RAM disk.

DISCUSSION -----

What you describe can occur using any version of the Mac OS that supports a RAM disk, System 7.0 or later. The Memory control panel has certain resources which are needed to build a RAM disk, and when starting with extensions off, some of those resources are disabled.

This issue is purely cosmetic. No data loss will occur. This message is presented when the RAM disk needs to be built, or when the extensions are turned off at startup. Below are the occasions a RAM disk needs to be built:

- The first time after RAM disk is turned on in the Memory control panel and the computer is restarted.

NOTE: The RAM disk is not available until after restarting the computer.

- When the computer is turned on or started from an off or shut down position.

NOTE: A RAM disk does not get built when choosing Restarting from the Special menu because it is already present in RAM.

Data loss cannot occur during a RAM disk's initial build because you have not had a chance to access the RAM disk yet.

Data loss cannot occur when starting the computer after a shut down, because the shut down process erases the contents of the RAM disk. The system will warn you

if you choose Shut Down while data is present on the RAM disk.

The Assistant Toolbox extension, which comes standard with PowerBook computers, can be used with desktop Macintosh computers. The Assistant Toolbox provides a persistent RAM disk, which saves the RAM disk contents to the hard drive before shutting down, and then reloads the saved data to the RAM disk when starting up. However, if you start the computer with extensions off, you disable the Assistant Toolbox extension and the data will not get copied. You can find Assistant Toolbox on Apple Computer's software update locations.

If the initialize RAM disk message is annoying, use Restart instead of Shut Down when you want to restart your computer with extensions off and a RAM disk is present. After the initial build of the RAM disk (restarting after the first time it's turned on in the Memory control panel), choosing Restart with extensions off will not present this message.

If you are presented with the initialize message, you should click Initialize. A RAM disk initializes very fast.

These articles can help you locate the Assistant Toolbox mentioned here:

QuickTime Conferencing: Can't Use ISDN Crd w/Quadra 840AV (5/96)

Revised: 5/10/96
Security: Everyone

QuickTime Conferencing: Can't Use ISDN Crd w/Quadra 840AV (5/96)

=====

Article Created: 10 May 1996

TOPIC -----

I have a Macintosh Quadra 840AV computer, and I'd like to use the QuickTime Conferencing H.320 ISDN NuBus Card in my computer. I noticed that the QuickTime Conferencing ISDN Kit Installation Guide states that I need a special DAV ribbon cable to use the card in my computer. However, I'm not sure which cable I specifically need in order to use the card.

DISCUSSION -----

The QuickTime Conferencing ISDN Kit Installation Guide manual is incorrect. As stated in the QuickTime Conferencing H.320 ISDN NuBus Card ReadMe file, you must have a Power Macintosh 7100AV or 8100AV computer in order to use this card.

Apple Internet Connection Kit 1.1 System Requirements (5/96)

=====

Apple Internet Connection Kit 1.1 System Requirements (5/96)
Article Created: 10 May 1996

TOPIC -----

What are the Apple Internet Connection Kit (AICK) 1.1 system requirements?

DISCUSSION -----

AICK 1.1 requires an Apple Macintosh with 68030 or better processor, Power Macintosh, or Mac OS-compatible system with:

- System 7.5.3 or later (System 7.5 Update 2.0 is included on AICK 1.1 CD)
- 8 MB RAM minimum (12 MB recommended)
- Minimum 9600 bps modem (14,400 bps or greater recommended), or connection to LAN already connected to the Internet.
- 10 MB available hard disk space (15 MB recommended)
- A CD-ROM drive

AICK 1.1: CD Version Disk Exchange (6/96)

Revised: 6/3/96
Security: Everyone

AICK 1.1: "CD Version Disk Exchange" (6/96)

Article Created: 10 May 1996
Article Reviewed/Updated: 3 June 1996

TOPIC -----

What is included in the Apple Internet Connection Kit (AICK) 1.1 "CD version Disk Exchange" for AICK 1.1 floppy disks?

DISCUSSION -----

Claris will offer a floppy disk fulfillment program for users who do not have a CD-ROM drive and require floppies. The floppy version is part number 505002U and is available directly through Claris only. Users will receive 10 high-density floppy disks for AICK 1.1.

NOTE: Users will not receive floppy disks for System 7.5 Update 2.0 through this fulfillment program. Apple strongly recommends that you install System 7.5 Update 2.0. System 7.5 Update 2.0 includes Open Transport version 1.1, which must be used to ensure that the Internet Connection Kit functions properly.

To obtain information about where you can get a copy of System 7.5 Update 2.0, see the following page on Apple's Web site:

<http://support.info.apple.com/update/update.html>

or contact the Apple Order Center.

Details

Users will need to provide proof of purchase for the CD version of AICK 1.1.

- The AICK 1.1 box will feature a sticker that says "CD version Disk Exchange Available - Details Inside."
- The disk fulfillment card inside will state the following:

"Do you need high density disks instead of a CD? No problem! Just call Apple Order Center and Apple will send you high density disks at no charge by 2 day Airborne delivery.*

Please have your product registratratriation number ready so that your request can be processed quickly.

*Orders received at the Apple Order Center will ship the next business day. If you require next day delivery, your order must be received at the Apple Order Center by noon Pacific Time on a business day; you will be charged \$4.00 for this expedited delivery."

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

MacDNS and International Date Issue, Workaround (5/96)

Revised: 5/11/96
Security: Everyone

MacDNS and International Date Issue, Workaround (5/96)

=====

Article Created: 11 May 1996

TOPIC -----

This article provides a workaround for users experiencing an issue with MacDNS and certain international date settings.

DISCUSSION -----

It turns out that some code assumed that the first separator in the abbreviated date string was a comma. Some date formats do not use a comma separator after the day of the week.

For example:

```
Thu, Jan 2, 1992 <-- OK
Gio, 2 gen 1992 <-- OK
tor 2 jan 1992 <-- no comma after day of week, the issue appears
```

If you are experiencing this issue, the workaround is to open the Date & Time control panel, click the Date Formats... button, and enter a comma after the day of week.

MAE 2.0: ccMail Compatibility (5/96)

=====

Article Created: 11 May 1996

TOPIC -----

This article describes the compatibility between MAE 2.0 and ccMail version 2 and 3..

DISCUSSION -----

MAE and ccMail versions 2 and 3 are compatible. However, there are 2 items that will prevent ccMail to run in MAE.

- Users is unable to use Direct Server Access under ccMail 2.2 & 3.0. Users must mount the mail volume first, then read mail.
- Users cannot save their password while logging onto ccMail 3.0, because if they do, MAE will quit with a core dump. Users will need to type their password each time to successfully log onto the Mail server.

PowerBook 2300: Memory Test Error Message at Startup (5/96)

Revised: 5/13/96
Security: Everyone

PowerBook 2300: Memory Test Error Message at Startup (5/96)

=====

Article Created: 9 April 1996
Article Reviewed/Updated: 9 May 1996

TOPIC -----

I am getting a strange error message on my PowerBook 2300 computer at startup. It says, "The built-in memory test has detected a problem. Please contact a service technician for assistance." What does this mean?

DISCUSSION -----

Issue

This problem is the result of an out-of-spec RAM card. The failure was first noticed with some third party 12 MB RAM cards at Apple's manufacturing facility in Cork, Ireland. A resistor change to that third party card corrected the problem.

Resolution

You should have the RAM card replaced by the manufacturer.

System 7.5 Update 2.0: Important Software Updates ReadMe (5/96)

Revised: 5/17/96
Security: Everyone

System 7.5 Update 2.0: Important Software Updates ReadMe (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

This article describes the Read Me file "Important Software Updates" installed by System 7.5 Update 2.0. This Read Me will only be installed in the folder "Important Software Updates" on PCI-based Power Macintosh computers. The following computers are in the PCI-based Power Macintosh family: Power Macintosh 7200, 7500, 8500, 9500.

DISCUSSION -----

This folder contains three software updates that enhance your computer's stability. These updates have been requested by customers using system software version 7.5.3, the version of system software installed on your computer.

This document explains each update. The details below will help you decide if you need to install the updates. Installation instructions are also provided below.

Important:

Since these updates are very new, the system software CD or floppy disks that came with your computer do not contain backup copies of these updates. Please follow the instructions at the end of this document to create a backup copy.

Apple Guide update

This folder contains Apple Guide version 2.0.2, which replaces Apple Guide 2.0 on your computer. Apple Guide 2.0.2 includes the following improvements:

- corrects a problem that causes Apple Guide indexes to be improperly alphabetized in some languages
- corrects a problem in the way that Apple Guide uses memory (this problem can cause a decline in system performance and, in some cases, cause the computer to crash)

To install Apple Guide version 2.0.2, follow these steps:

1. Click the Apple Guide icon in this folder to highlight it.
2. Hold down the Option key and drag the Apple Guide icon to the System Folder icon. (The System Folder should be closed.)
3. When you see a message asking if you want to put Apple Guide in the Extensions folder, click OK.
4. A second dialog will appear warning you that an item named "Apple Guide" already exists in the Extensions folder. Click OK to replace the existing version.
5. Select Restart from the Special menu.

Drive Setup update

This folder contains Drive Setup version 1.0.4, which includes the following improvements:

- corrects a problem with some IDE drives
- corrects a problem that could lead to multiple partitions having the same date and time stamp (this problem is most likely to occur on very fast systems)

Drive Setup version 1.0.4 does not need to be installed. To use it, double-click the Drive Setup icon in this folder. If you like, you can move Drive Setup out of this folder to a more convenient location on your hard disk (or copy it onto a floppy disk).

Ethernet Compatibility extension

Important:

The information in this section is for computers connected to a Novell Netware network. If your computer is attached to a Novell Netware network, read the information in this section and install the Ethernet Compatibility extension.

This folder contains the Ethernet Compatibility extension version 1.0.3, which corrects a problem that occurs when you shut down a PCI-based computer that is connected to a Novell Netware network and is running system software version 7.5.3. Without this extension, your computer may crash when you shut down or restart.

To install Ethernet Compatibility version 1.0.3, follow these steps:

1. Click the ENET Compatibility icon in this folder to highlight it.
2. Hold down the Option key and drag the ENET Compatibility icon to the System Folder icon. (The System Folder should be closed.)
3. When you see a message asking if you want to put ENET Compatibility in the Extensions folder, click OK.
4. Select Restart from the Special menu.

Note:

After you install this extension, you will notice a two-minute delay in shutting down the computer. After two minutes, the machine will resume the shut down process. To avoid this delay, log out of the Netware network before you shut down or restart your computer.

Making a Backup Copy of These Updates

=====

To make a backup copy of these updates, you use a program called Disk Copy.

Before you start, make sure you have a high-density floppy disk. Then follow the steps below. You may want to print these instructions before you begin (open the File menu and choose Print).

1. Locate the disk image named "Updates.image" in this folder and double-click to open it.
2. When the Disk Copy Welcome screen appears, click anywhere inside it.
3. When the Disk Duplicator window appears, click the Make a Copy button.
4. Insert the high-density floppy disk into the disk drive.
5. At the "Are you sure..." message, click the Duplicate button.
6. When you have copied the disk image, remove the floppy disk and label it. Keep this backup disk with your system software CD or floppy disks.
7. Click Stop Copying to close the Disk Copy application.
8. To lock the disk:
 - Look at the back of the disk.
 - Find the square hole with a tab inside it in the corner of the disk.
 - Slide the tab toward the edge of the disk so that the square hole is open.

Important:

You may encounter errors while running Disk Copy if Virtual Memory is turned on. If Virtual Memory is turned on and you see the message "An error (-620) occurred while reading the disk image" or the message "An error (-74) occurred while copying/verifying the disk," turn Virtual Memory off. Then restart your computer, and begin Disk Copy again.

Setting Up A 100Base-T Network: Requirements (5/96)

Revised: 5/13/96
Security: Everyone

Setting Up A 100Base-T Network: Requirements (5/96)

=====

Article Created: 13 May 1996

TOPIC -----

I'm setting up a Fast Ethernet (100Base-T) network in conjunction with our existing 10Base-T network. I have installed the 100Base-T cards correctly, but am only getting near 10Base-T performance. What could be wrong?

DISCUSSION -----

There are many variables which can affect network performance, as well as some requirements for setting up a 100Base-T or Fast Ethernet network.

First, existing or new cabling should be Category 5 Unshielded Twisted Pair wire (UTP) for optimum performance. Type 1 STP may be used, but will not offer the performance of UTP cable. Also, the diameter of your network must not exceed 205 meters (10Base-T required a maximum diameter of 500 meters).

Next, 100Base-T networks require a 100Base-T compliant hub. If you are going to be replacing your existing 10Base-T network hub, this may require a switchable hub (one that can switch between 10Base-T or 100Base-T) or a hub that has both 10Base-T and 100Base-T connections.

An alternative to a switchable hub is to use a 10/100Base-T bridge between the 10Base-T and 100Base-T segments. This alternative would allow you to add a less expensive non-switching 100Base-T hub for your Fast Ethernet segment and keep your existing non-switching 10Base-T hub. Keeping the two segments separate will also increase overall network bandwidth by separating high traffic and low traffic workgroups.

NOTE: There should be a maximum of one Class 1 hub or two Class 2 hubs (or two repeaters) within the same collision domain.

Client performance may be affected by local activity such as program sharing or other I/O activity like modem, printer, or adb communication. Another factor at the client may be hard drive performance. A typical internal hard drive

sustained transfer rate may not be any more than 4 megabytes per second. Reducing the number of concurrent processes and isolating a fast internal hard drive (or providing a disk array) may increase performance.

Finally, driver code may not be fully native - or native to the currently active network architecture. Check with your vendor for more information regarding driver performance and compatibility with your system software.

Map CP Does Not Observe Daylight Savings Time (5/96)

Revised: 5/13/96
Security: Everyone

Map CP Does Not Observe Daylight Savings Time (5/96)

=====

Article Created: 13 May 1996

TOPIC -----

I am running System Software 7.5. When I check the Daylight Savings Time check box option in the Date & Time control panel, the Map control panel changes my selected city in the Time Zone and my time is off by 1 hour. I have updated to System Software 7.5 Update 2.0 and I still have this problem. What's wrong and how can I avoid this problem?

DISCUSSION -----

When the Daylight Savings Time (DST) check box is checked in the Date & Time control panel, by design, the time will advance by 1 hour. Unfortunately, the Map control panel does not recognize this option being checked when the set button is clicked. As a side effect, the Map control panel incorrectly selects the time zone next to the correct one (1 hour off) and defaults to the city that is alphabetically first in that time zone. This problem should be fixed in a future version of the Map control panel. Currently, there are two workarounds to avoid this problem: 1) If the Daylight Savings Time check box option is checked, don't select the Set button in the Map control panel after setting the correct Time Zone and time in the Date & Time control panel. When changing Time Zones, change cities only in the Date & Time control panel since it recognizes the Daylight Savings Time option. Or 2) If a user wants to be able to change the set location in the Map control panel, make sure the Daylight Savings Time check box option is unchecked in the Date & Time control panel. Set the correct Time Zone and time manually in the Date & Time control panel. Now the set button should work correctly in the Map control panel.

PowerBookControl Strip Moves When Changing Resolution (5/96)

Revised: 5/13/96
Security: Everyone

PowerBookControl Strip Moves When Changing Resolution (5/96)

=====

Article Created: 13 May 1996

TOPIC -----

PowerBooks with System 7.5.2 or later may experience a cosmetic problem with the Control Strip. The problem is that when the PowerBook goes from a lower resolution display to a higher resolution display, the Control Strip may appear half-way up the screen.

DISCUSSION -----

This will only happen if the Control Strip is opened, closed, or moved while it is at the lower resolution. The workarounds are either not to adjust the Control Strip while it is at the lower resolution, or to simply drag the Control Strip back to the desired position while holding down the Option key when the problem occurs.

Apple is currently investigating this problem and hopes to have it fixed in a future system update.

LaserWriter Printers: Envelopes with Windows Suggestions (5/96)

Revised: 5/13/96
Security: Everyone

LaserWriter Printers: Envelopes with Windows Suggestions (5/96)

=====

Article Created: 13 May 1996

TOPIC -----

Can I print envelopes that have cellophane or plastic windows for the address on my LaserWriter printer?

DISCUSSION -----

Apple Computer, Inc. has not done extensive testing on envelopes with cellophane or plastic windows, so we don't have recommendations one way or the other. However, there are some basic guidelines you should follow.

If you decide to use window envelopes, see if the paper manufacturer has made any recommendations on the amount of heat the cellophane or plastic can withstand. The various LaserWriter printers use different amounts of heat to transfer the toner to the paper depending on the model. The faster the printer (pages per minute), the more heat the LaserWriter fuser produces to adhere the toner to the paper.

There are also newer materials similar to tissue paper being used, which are less likely to cause any sort of problems in your LaserWriter printer.

Before using large quantities of envelopes, try one or two to make sure they work properly in your LaserWriter printer.

PC Compatibility Card: 32-bit Disk Access Not Supported (5/96)

=====

Article Created: 13 May 1996
Article Reviewed/Updated: 21 May 1996

TOPIC-----

I have a PC Compatibility Card in my Power Macintosh. After installing Windows 95, I got a message that the computer is not running at optimal performance. It then stated that the hard drive, floppy drive, and CD-ROM drive are running in "Compatibility Mode". What is compatibility mode, and is this normal?

DISCUSSION -----

Windows 95 has the ability to use a 32-bit protected-mode driver to access the hard drive controller and other drive controllers. On some equipment, including the PC Compatibility Card, Windows 95 is unable to access the drive controllers in this mode, so Windows 95 must use 16-bit real-mode drivers. This is the Compatibility Mode that Windows 95 mentioned. Using the 16-bit real-mode is normal for the PC Compatibility Cards. Windows 95 has the ability to use either 32-bit or 16-bit drivers, so this should not cause any problems.

Security: Everyone

Pwr Mac 7200 & Sys 7.5.3: Sound Amplification Input Ext. (5/96)

=====

Article Created: 13 May 1996

TOPIC -----

I have a Power Macintosh 7200/75 which I recently upgraded to System 7.5.3. Can I use the Sound Amplification Input extension with System 7.5.3? I noticed that it is not included with the Power Macintosh 7200 series computers which have System 7.5.3 pre-installed on them.

DISCUSSION -----

No, the Sound Amplification Input extension is not supported when you are using System 7.5.3. If you are using System 7.5.3 on a Power Macintosh 7200 computer, you should use a microphone which supplies the proper line level voltage, such as the Apple Plaintalk Microphone.

The Tech Info Library article titled "PlainTalk Microphone: Specifications" provides additional information about the specifications of PlainTalk microphones.

System 7.5 Update 2.0:PCI-based Power Macintosh Computers (5/96)

Revised: 5/17/96
Security: Everyone

System 7.5 Update 2.0:PCI-based Power Macintosh Computers (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

Should I install the System 7.5 Update 2.0 on my Power Macintosh PCI-based computer? It already has System 7.5.3 installed.

DISCUSSION -----

The System 7.5 Update 2.0 contains additional files or updates that enhance your computers stability. PCI-based Power Macintosh computers shipped with system software 7.5.3, it is not necessary to install the update. The System 7.5 Update 2.0 has a few components that are newer than the versions included with system 7.5.3 that shipped with your CPU. The three software updates include Drive Setup update, Apple Guide update, and an Ethernet Compatibility extension. These updates are included in a folder called 'Important Software Updates' on the hard drive of the PCI-based Power Macintosh computer.

The Tech Info Library article titled "System 7.5 Update 2.0: Important Software Updates ReadMe" contains more information that can help you decide if you need to install these updates.

QuickTime Conferencing: Third-Party NT-1 Companies (5/96)

Revised: 5/14/96
Security: Everyone

QuickTime Conferencing: Third-Party NT-1 Companies (5/96)

Article Created: 14 May 1996

TOPIC -----

This article contains a list of third-party companies providing Network Terminal Adapters (NT-1) for the QuickTime Conferencing Kit. A Network Terminal Adapter is required to use QuickTime Conferencing ISDN Kit over a Basic Rate Interface (BRI) ISDN line.

DISCUSSION -----

The QuickTime Conferencing ISDN Kit (NuBus) M4585LL/A allows users of the QuickTime Conferencing Kit to do WAN videoconferencing and collaboration Mac-to-Mac or videoconferencing only Mac-to-PC and Mac-to-Room based system using H.320 hardware codec over Telco-supplied ISDN lines. Includes H.320 codec/ISDN card, H.320 ISDN software and accessory kit.

However, a Network Terminal Adaptor (NT-1) is required to use the QuickTime Conferencing ISDN Kit over a Basic Rate Interface (BRI) ISDN line. The NT-1 terminates the ISDN line at the user's end and powers the ISDN line from the network interface box to the ISDN device. An ISDN line requires power and is unusable in the event of a power outage. Connecting the NT-1 to a Uninterruptable Power Supply is suggested.

A NT-1 can be purchased through your local ISDN provider or you can purchase one from the following companies:

Companies	Phone Number	Model Name
Quicomm	1-800-244-3688	NT-1 Network Terminator
Intellicom	1-800-884-ISDN	Various models
PicturePhone Direct	1-800-810-9966	Tone Commander NT1U-220TC

MAE 2.0: Bootting from boot2 resources fails! Fatal Error (5/96)

Revised: 5/14/96
Security: Everyone

MAE 2.0: Bootting from boot2 resources fails! Fatal Error (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

When starting MAE up, the following error occurs in the shell that MAE started from:

```
# Bootting from boot2 resources fails!  
# Fatal error in Toolbox
```

MAE will not start at this point. MAE was running just fine previously.

DISCUSSION -----

A file in the user's HOME System Folder appears to be corrupt. To correct, try these options:

- 1) In a shell, delete the ".fs_cache" file in the System Folder, the restart MAE.
- 2) If the above does not work, rename the user's System Folder, and launch MAE. This will force MAE to create a new system, and the user can then copy desired control panels and extensions from the previous System Folder to the new one.

Apple Internet Server Solutions 2.0 CD Upgrade (5/96)

Revised: 5/14/96
Security: Everyone

Apple Internet Server Solutions 2.0 CD Upgrade (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

This article describes where to look for upgrade information on the Apple Internet Server Solutions 2.0 CD.

DISCUSSION -----

Apple has received many requests for upgrade information to the announced Apple Internet Server Solutions 2.0 CD-ROM. We have not announced how this will be done, but we are working on an upgrade path. For information on the Apple Internet Server Solution 2.0 CD upgrade, please check the web page at the following URL:

Power Macintosh 7500/7600/8500: Video Capture (5/96)

Revised: 3/19/97
Security: Everyone

Power Macintosh 7500/7600/8500: Video Capture (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

This article contains questions about the video capture capabilities of the Power Macintosh 7500, 7600, and 8500 series computers.

Questions Answered in this Article:

=====

1) Question: What is the color spacing in the video capture of the Power Macintosh 7500, 7600, and 8500 series computers? Is it 8-bit red + 8-bit green + 8-bit blue, or is it some other combination that provides 24-bit video?

2) Do the Power Macintosh 7500, 7600, and 8500 series computers use the Phillips TDA-8758 analog-to-digital converter chip? I understand that it only offers 8-bit chrominance and 8-bit luminance capabilities. Doesn't this contradict the claim of a 24-bit video subsystem?

3) I ran an AV test that showed the AV ramp to be displaying 30 discrete levels from dark to light and resembling more of a 5-bit capture than 8-bit. Is Apple's video subsystem a true 24-bit?

DISCUSSION -----

1) Question: What is the color spacing in the video capture of the Power Macintosh 7500, 7600 and 8500 series computers? Is it 8-bit red + 8-bit green + 8-bit blue, or is it some other combination that provides 24-bit video?

Answer: The 24-bit color space for the Power Macintosh 7500, 7600, and 8500 series computers is scaled 24 bpp RGB (8-bit Red + 8-bit Green + 8-bit Blue + 8-bit alpha channel)

The Power Macintosh 7500, 7600, and 8500 series computers capture video in millions of colors (24-bit), and are capable of capturing 32-bit color, using 8 bits as an alpha channel.

2) Question: Do the Power Macintosh 7500, 7600, and 8500 series computers use the Phillips TDA-8758 analog-to-digital converter chip? I understand that it only offers 8-bit chrominance and 8-bit luminance capabilities. Doesn't this contradict the claim of a 24-bit video subsystem?

Answer: The Power Macintosh 7500, 7600, and 8500 series computers do use the Phillips TDA-8758 analog-to-digital video interface. However, this does not limit the video capture to 16-bit. This chip provides two 8-bit analog-to-digital converters (ADCs): one for chrominance and one for luminance. However, since there are direct and specific relationships between luminance (Y) and chrominance (C) values and RGB, the separate 8-bit luminance and chrominance data can be supplied to a digital video decoder (which is an SAA 7196 decoder) for conversion into RGB.

The digital video decoder has a chrominance and luminance processor that converts the luminance and chrominance video data into separate 8-bit "Y" and 8-bit "UV" data ("UV" is used to refer to the digital version of chrominance). The "YUV" data is then fed separately into an RGB matrix where the video data is converted from "YUV" to 24 bpp RGB data (24 bpp for the color information and 8-bits for the alpha channel: 8-bit Red + 8-bit Green + 8-bit Blue + 8-bit alpha channel)

3) Question: I ran an AV test that showed the AV ramp to be displaying 30 discrete levels from dark to light and resembling more of a 5-bit capture than 8-bit. Is the video subsystem used on the Power Macintosh 7500, 7600, and 8500 series computers a true 24-bit system?

Yes, the video subsystem used on the Power Macintosh 7500, 7600, and 8500 series computers is a true 24-bit system. If you create a simple white-to-black gradient using a graphics application, then output that image to an NTSC monitor, the NTSC image will be a smooth gradient, without the "stairstepping" you describe in your test.

TITLE

Open Transport: Error Codes

Article ID: 19791
Created: 5/14/96
Modified: 10/14/97

TOPIC

This article describes the Open Transport error codes.

DISCUSSION

Result code	Value	Meaning
kOTBadAddressErr	-3150	The specified protocol address was in an incorrect format or contained illegal information.
kOTBadOptionErr	-3151	The specified protocol options were in an incorrect format or contained illegal information.
kOTAccessErr	-3152	The user does not have permission to negotiate the specified address or options.
kOTBadReferenceErr	-3153	The specified EndpointRef or TEndpoint * does not refer to a valid endpoint.
kOTNoAddressErr	-3154	The endpoint could not allocate an address, or an address was required and not supplied by the client.
kOTOutStateErr	-3155	The function was issued in the wrong sequence.
kOTBadSequenceErr	-3156	An invalid sequence number was specified, or a NULL call pointer was specified when rejecting a connection request.
kOTLookErr	-3158	An asynchronous event has occurred on this endpoint.
kOTBadDataErr	-3159	The amount of client data specified was not within the bounds allowed by the endpoint.
kOTBufferOverflowErr	-3160	The number of bytes allocated to hold a result is greater than zero, but not sufficient to store the result.
kOTFlowErr	-3161	The endpoint is in asynchronous mode, but the flow control mechanism prevents the endpoint from accepting any data at this time.
kOTNoDataErr	-3162	This endpoint is in non-blocking mode, but no data is currently available. It is also returned by LookupName when no names are found.
kOTNoDisconnectErr	-3163	No disconnect indication is available.
kOTNoUDERR	-3164	No unit data error indication currently exists on this endpoint.
kOTBadFlagErr	-3165	An invalid flag was specified.
kOTNoReleaseErr	-3166	No orderly release indication currently exists on this endpoint.
kOTNotSupportedErr	-3167	This action is not supported by this endpoint.

kOTStateChangeErr	-3168	<p>The endpoint is undergoing a transient state change. This error is returned when a function call is made while an endpoint is in the process of changing states. The client should wait for an event indicating the endpoint has finished changing state and call the function again.</p> <p>Note: The equivalent state-change error code, TSTATECHNG, is not described in the 1992 X/Open XTI specification.</p> <p>This error is also returned if you attempt to use an "incompatible" function while another operation is still ongoing (for example: calling SndUDData while an OptionManagement call is still outstanding).</p>
kOTStructureTypeErr	-3169	An unsupported structure type was passed in the structType field. This error is also returned when the structType field is inconsistent with the endpoint type.
kOTBadNameErr	-3170	The endpoint name is invalid.
kOTBadQLenErr	-3171	The argument qlen when the endpoint was bound with Bind was zero.
kOTAddressBusyErr	-3172	The requested address is in use, or this endpoint does not support multiple connections with the same local and remote addresses. This result code indicates that a connection already exists. As a return value for a Bind call, it may also indicate that no dynamic addresses are available for protocols or configuration methods that allow dynamic addressing.
kOTIndOutErr	-3173	There are outstanding connection indications on the endpoint. All other connection indications must be handled either by rejecting them with SndDisconnect, or by accepting them with Accept.
kOTProviderMismatchErr	-3174	The endpoint that is to accept the connection is not the same kind of endpoint as this one.
kOTResQLenErr	-3175	When this endpoint was bound (see Bind), the qlen parameter was greater than zero. But to accept a connection on an alternate end-point, such as this one, the endpoint must be bound with a qlen parameter equal to zero.
kOTResAddressErr	-3176	The address to which this endpoint is bound differs from that of the endpoint that received the connection request; thus, this endpoint cannot accept this connection request.
kOTQFullErr	-3177	The maximum number of outstanding indications has been reached for the endpoint.
kOTProtocolErr	-3178	An unspecified protocol error occurred.
kOTBadSyncErr	-3179	A call to Sync was made at non-SystemTask time.
kOTCanceledErr	-3180	An outstanding call was canceled.
kOTNoError	0000	The function completed execution without error.

Energy Saver: Volume Increases After Waking Up (5/96)

Revised: 5/15/96
Security: Everyone

Energy Saver: Volume Increases After Waking Up (5/96)

=====

Article Created: 14 May 1996

TOPIC-----

When I wake my Power Macintosh 7200/75 computer from sleep, the volume in the Sound control panel is always set to the maximum level. This happens even if I have set the volume to the lowest setting possible prior to putting the computer to sleep. I have a friend who has a Power Macintosh 7200/120 computer and it does not exhibit this symptom. Is there something I can do about this?

DISCUSSION -----

This issue occurs with Power Macintosh 7200 series computers using the Energy Saver control panel version 2.0. It has been resolved with the Energy Saver control panel v2.0.1, which is included in System 7.5 Update 2.0 (System 7.5.3). Your friend's Power Macintosh 7200 series computer came with System 7.5.3 pre-installed, which is why it does not have this problem.

QuickTime: Extras Folder on Macintosh CD (5/96)

Revised: 5/14/96
Security: Everyone

QuickTime: Extras Folder on Macintosh CD (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

My Power Macintosh 7500 came with QuickTime. In the QuickTime Read Me file, it states the QuickTime Extras folder includes sample movie files, the QuickTime Musical instruments extension, and Movie Player 1.0. The Apple Extras folder on my hard disk contains a QuickTime Extras folder, but it does not contain any of these items. Where can I get these?

DISCUSSION -----

On current Macintosh computers, such as the Power Macintosh 7500, the Apple Extras on the hard disk contains a QuickTime extras folder. However, as you discovered, the folder does not contain the sample files. The CD-ROM disc also contains an Apple Extras folder. Within the Apple Extras folder there is a QuickTime Extras folder with sample movies, photos, and music. You can either drag these to your hard disk, or play them directly from the CD-ROM disc.

PowerBook 2300/PowerBook 500 with PPC Upgrade Slow Typing

Revised: 6/18/96
Security: Everyone

PowerBook 2300/PowerBook 500 with PPC Upgrade Slow Typing (6/96)

Article Created: 14 May 1996
Article Reviewed/Updated: 15 June 1996

TOPIC -----

Owners of the PowerBook 2300c and the PowerBook 500 with PPC Upgrade may experience performance problems related to an incorrect cache flushing call. Some people have noted that these machines can be much slower than expected in certain situations. In particular people have noticed slow typing in Microsoft Word. They have also noticed slow printing to a serial printer when ARA is active.

DISCUSSION -----

Symptoms -----

The most common symptom is that typing appears to be slow. The user may report that they can easily type faster than the computer can keep up with. There are a number of things which make the problem show up.

Possible Causes -----

If any of the following are true, the symptom may occur. The more that are true, the worse the issue will be.

- 1) Microsoft Office Manager v4.2.x control panel is active in the System Folder.
- 2) Microsoft Word 6.0.x is being used.
- 3) Express Modem software is loaded and turned on.
- 4) The Launcher is active in the background.

Resolution -----

Apple has identified the cause and has fix this issue with System 7.5.3 Revision 2. This software can be found on Apple Computer's online software update sites. If you do not have access to online services, please refer to Tech Information

Library article, "Macintosh System 7.5.3 Revision 2: FAQ."

These articles can help you locate the software update mentioned here:

* "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

* "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

This article was published in the Information Alley on 18 June 1996.

Article Change History:

18 Jun 1996 - Added Info Alley publication info and reworded.

15 Jun 1996 - Added System 7.5.3 Revision 2 fix.

Chinese Language Kit:Enable WorldScript Before Installing (5/96)

Revised: 5/14/96
Security: Everyone

Chinese Language Kit:Enable WorldScript Before Installing (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

I have a Power Macintosh 7200 computer, and I am having difficulty installing the Chinese Language Kit. Following the instructions in the Power Macintosh 7200 and 9500 Series ReadMe file, I first installed the WorldScript Updater 1.0, then I installed the Chinese Language Kit version 1.1 and the Chinese Language Kit Updater. I even disabled the extensions using the Extension Manager control panel before installing the Chinese Language Kit so that they would not interfere with the installation process. However, when I restarted the computer after completing the installation, the computer locked up. What could be causing this to happen?

DISCUSSION -----

From your description it is likely that you disabled the WorldScript extensions before you installed the Chinese Language Kit. By doing this, the Chinese Language Kit installer did not recognize that you had a later version of WorldScript already installed so it installed WorldScript 1.0, which is not compatible with your computer.

To resolve this, restart the computer, enabling the WorldScript and System extensions in the Extensions Manager. Then, reinstall the Chinese Language Kit and Updater.

MAE: Can't Open /dev/appletalk/lap/ethertalk0/control (5/96)

Revised: 5/14/96
Security: Everyone

MAE: Can't Open /dev/appletalk/lap/ethertalk0/control (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

I just launched MAE 2.0, and see the message "Unable to open the file '/dev/appletalk/lap/ethertalk0/control, please be sure the file exists'" in the UNIX window from which I launched MAE. What does this mean?

DISCUSSION -----

AppleTalk is not installed properly. An AppleTalk installation must be preformed as root on each system you want to run MAE. You cannot copy your MAE binaries from machine to machine. The AppleTalk installation correctly configures your kernel and creates device files used by AppleTalk.

In addition, you may see this error if you have just installed MAE and not yet restarted your workstation.

PCI Token Ring Card Compatibility Questions (3/97)

Revised: 3/14/97
Security: Everyone

PCI Token Ring Card Compatibility Questions (3/97)

Article Created: 14 May 1996
Article Reviewed/Updated: 14 March 1997

TOPIC -----

- Is Apple's PCI Token Ring Card compatible with any Power Macintosh that has a PCI slot? If not, with which Power Macintosh computers is it compatible?
- I also noticed that the ReadMe on the Install disk only specifies the Power Macintosh 7500, 8500 and 9500 series computers are compatible. Does that mean it is not compatible with the Power Macintosh 5400 series computers?
- Are the PCI Token Ring cards and PCI DOS Compatibility cards compatible with each other?
- What about the PCI Token Ring cards and Softwindows compatibility?

DISCUSSION -----

PCI-Based Power Macintosh Compatibility

The Apple PCI Token Ring Card will work with and is supported by:

- Power Macintosh 7200/120 computers*
- Power Macintosh 5400 Performa computers
- Power Macintosh 7500, 7600, 8500, and 9500 series computers
- Workgroup Server 7250 series computers
- Workgroup Server 8550 series computers

*NOTE: As stated in the PCI Network Installer ReadMe file, the Apple PCI Token Ring Card is not compatible with the Power Macintosh 7200/75 and 7200/90 series computers.

Incompatible With DOS Compatibility Card

..TIL19798-PCI_Token_Ring_Card_Compatibility_Questions_3-97.pdf

The PCI Token Ring card and the PCI DOS Compatibility cards can be used in machines that support each card. There is not a working driver that will allow the PCI DOS Compatibility card to communicate using the PCI Token Ring card. A driver is included with the DOS Compatibility software but it is not supported at this time.

Compatible With Softwindows 2.0

According to Insignia Solutions, makers of Softwindows, the Apple PCI Token Ring card is compatible with Softwindows 2.0.

NOTE:

This article provides information about a non-Apple product, Softwindows. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Insignia Solutions, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

14 Mar 1997 - Added details about PC card.
07 Jun 1996 - Clarified 7200 compatibility.
21 May 1996 - Added info about 7200 compatibility.

Fax Sender GX: Using GeoPort as Fax Server (5/96)

Revised: 5/14/96
Security: Everyone

Fax Sender GX: Using GeoPort as Fax Server (5/96)

=====

Article Created: 14 May 1996

TOPIC -----

I've heard that I can use Fax Sender GX to set up a computer on an AppleTalk network to act as a central server for sending faxes, but I'm not sure how to do this.

DISCUSSION -----

Yes, you can use Fax Sender GX in this way. It's useful because other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

Note: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

PowerBook 140 and 170 and the Apple Fax/Data Modem (5/96)

Revised: 5/14/96
Security: Everyone

PowerBook 140 and 170 and the Apple Fax/Data Modem (5/96)

Article Created: 13 May 1996

TOPIC -----

This article discusses some common facts about the PowerBook 140 and 170 and Apple Fax/Data Modem

DISCUSSION -----

- The modem that originally shipped with the PowerBook 140 and 170 was called the Apple Fax/Data Modem.
- The latest version of the Software that shipped exclusively for the Apple Fax/Data Modem is called FAX Sender 1.0.3.
- The latest supported Software for this modem is Express Modem 1.5.5 and fulfillable through CR fulfillment option.
- Telecom 2.3.2 was tested with the modem and works if the PowerBook is running 7.1 or later.
- Earlier versions of the Express Modem software had to be "Added" over the top of the FAX Sender Software (not true with 1.5.5 and telecom 2.3.2)
- Express modems do NOT work in PowerBook 100, 140, 145, 145b, 150 or 170 models.
- To identify a PowerBook modem, open a modem application like Zterm and enter the command ATl0 or ATl4. The response will identify "data/send FAX" for the Apple Fax/Data Modem. Using the same command with an Express Modem, the response is: "APPLE EXPRESS MODEM....."

Calendars and More: Disk Error Message (5/96)

Article Created 15 May 1996
Article Reviewed/Updated: 30 May 1996

TOPIC -----

I recently purchased a Color Stylewriter 1500. I am trying to use the program Calendars and More, which was included with the Color Stylewriter. Every time I double-click on the icon for Calendars and More, I receive a message that there has been a disk error. My friend has a Color Stylewriter 2500 and she has the same problem. Is there anything I can do about this?

DISCUSSION -----

To use the Calendars and More application, you must insert the Apple Color Printing CD in the CD-ROM drive. The Calendars and More application requires information stored on the Apple Color Printing CD to work properly. If you need additional information, contact the publisher of the CD, Mindscape.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

- Overview of OpenDoc

This document provides pointers for getting the most from the Cyberdog beta software. For more information, check Cyberdog home page on the World Wide Web:
<http://cyberdog.apple.com>

Overview of Cyberdog

Cyberdog is an integrated suite of tools for the Internet that includes these features:

- World Wide Web browser
- E-mail reader and handlers

- Newsgroup reader and handlers
- Gopher browser
- File transfer and remote login facilities (FTP and Telnet)
- Utilities for storing and organizing Internet information
- Security facilities

Cyberdog software integrates a set of full-featured Internet tools with a common interface. Cyberdog's Internet Starting Point combines these tools into one easy-to-use package, making Internet solutions simple. The Starting Point is Cyberdog's predesigned way of using the Cyberdog tools. Because Cyberdog is based on OpenDoc component technology, you can also use Cyberdog "parts" to create your own documents with embedded Internet functionality, thus creating your own Internet "starting point."

For more information about OpenDoc, see the section "Overview of OpenDoc" at the end of this document.

Starting Up

The procedures in this document assume that, in addition to an Internet connection, you have properly installed Cyberdog. For more information on downloading and installing, see the Cyberdog home page on the World Wide Web: <http://cyberdog.apple.com>.

Cyberdog installation places a folder named Cyberdog b2 Folder on your hard disk. It contains these files and folders:

- Cyberdog Starting Point file
- First Notebook file
- Other Cyberdog Documents folder
- Tools folder

To use Cyberdog features, double-click the Starting Point icon in the Starting Point folder. A screen with six buttons appears:

- Notebook is linked to the file named First Notebook.
- Log is linked to your personal log file.
- Explore is linked to the Cyberdog Explore page on the World Wide Web, so clicking this button connects you to the Internet.
- Search is linked to a search engine page on the World Wide Web, so clicking this button connects you to the Internet.
- Discuss: The right-hand button is linked to your mail trays, or a setup screen for your mail server. The right-hand button is linked to available news servers.

Hints, Pointers, and Highlights

Some pointers of particular interest:

..TIL19802-Getting_Started_With_Cyberdog_1-0_File_5-96_(TA35495).pdf

- If the Cyberdog menus don't appear in the Internet Starting Point custom document, hold down the Option key and click on any of the Starting Point buttons to restore the Cyberdog menus.
- You can select any Internet object icon and drag it to any Cyberdog component, such as mail or a notebook, or to the Macintosh desktop (Finder). You can also select a text URL, for example, in a mail message or document, and drag it into your notebook or mail.
- You can go to a URL from within a mail message by double-clicking the URL icon.
- Mail and News use the same message and sending formats. You can include pictures, links and attachments in either.

Creating a Notebook of Internet Resources

You use the Notebook to create a personalized collection of Internet resources, providing a means to quickly access the information that's most useful to you. The Notebook is actually an OpenDoc container that holds Internet items, including e-mail addresses, as well as addresses for Web sites, FTP sites, Gopher sites, Telnet sites, and newsgroups. You can also use the Notebook to save pictures and other files available on the Internet; You can also include your newsgroups and mail trays.

Opening a notebook

To open a notebook, double-click the First Notebook icon in the Cyberdog b2 folder, or click the Notebook button that appears on the Starting Point screen.

Adding an item to a notebook

To create a notebook entry, open a notebook, then:

- Drag any Internet item with an icon and a name into a notebook.

Or:

- Select a URL text string and drag it into a notebook.

Or:

1. From the Notebook menu, choose Add Item To Notebook.
2. Type in the Internet address.
3. Click OK.

To add an item while a notebook is either open or closed:

1. From the Cyberdog menu, choose Add Selection to Notebook or Add Window to Notebook.

2. Follow the instructions in the dialog box to place the item in the appropriate notebook and category.

Adding an e-mail address to a notebook

To have e-mail addresses show up in special address lists (described in the later section on mail) add those addresses to your default notebook. Unless you change it the default is the First Notebook.

To add an e-mail address:

- From the Mail/News menu, choose Add E-mail Address to Notebook.

Or:

- Drag any e-mail address, such as one that appears in the address field of an e-mail message, into a notebook.

Or:

- Drag any mailto: URL from a web page into the notebook.

Deleting an item from a notebook

You can use any of these methods to delete a notebook entry:

- Drag any notebook item to the Trash.

Or:

- Select a notebook item and press the Delete key.

Or:

- With a notebook item selected, choose Delete from the Edit menu.

Renaming a notebook item

To rename a notebook item, select the name of the item you want to rename, then choose Rename Item from the Edit menu. (Unlike Macintosh file names, you can NOT rename a notebook item by selecting it and typing over it.)

Organizing a notebook with categories

You can organize your Internet information by creating notebook categories. Note that unlike folders on the Macintosh desktop, you can only make one level of categories; you can't put one category inside another.

To create a category:

1. Choose Add Category from the Notebook menu.
2. Give the category a name.

3. Drag in any items that you want to appear in that category. A bar shows where the item will appear.

Creating multiple notebooks

If you save a large number of Internet items, you may find it useful to create multiple notebooks to organize those Internet resources. For example, you might find it useful to create a Work Notebook, a Finance Notebook, a Kids' Notebook and a Hobbies Notebook. You can create as many notebooks as you wish.

No matter how many notebooks you have, Cyberdog recognizes just one default notebook. Unless you specify otherwise, Cyberdog uses First Notebook as the default. These are the differences between the default notebook and the other notebooks:

- The only e-mail and newsgroup addresses that show up in address lists are those that you store in the default notebook. (See the section on mail or more information.)
- If you add an item to a notebook using the Add Item... menu command, the default notebook is preselected in the dialog box that lets you choose the notebook to which you're adding the item.
- The Notebook button in the Cyberdog Starting Point window is linked to your default notebook.

To create a new notebook:

1. Open a notebook.
2. From the Document menu, select New.

Setting the default notebook

Cyberdog uses First Notebook as the default. To specify a different default notebook:

1. Open the notebook that you want to make the default.
2. From the Notebook menu, choose Set Default Notebook.

Renaming a notebook

Renaming a notebook (including the First Notebook) is just like changing the name of any other file on the Macintosh. To rename a notebook:

1. In the Cyberdog Tools folder, select the notebook you want to rename.
2. Press Enter to highlight the name.
3. Type in the new name for the notebook.

Opening multiple notebooks

To open multiple notebooks:

1. While in Cyberdog, setup a default notebook if you have not already done so (see earlier section). You must have a default notebook set for this to work.
2. Close all Cyberdog windows so that Cyberdog quits.
3. Launch the non-default notebook by double-clicking on it from the Finder.
4. Once that has opened, use the Show Default Notebook menuitem in the Cyberdog menu to open the default notebook you set earlier.

IMPORTANT Do NOT open multiple notebooks by double-clicking on more than one notebook icon or by using the Open menuitem in the Document menu. Each notebook you open this way requires additional random access memory (RAM), which can cause your computer to run out of memory.

Deleting a notebook

To delete a notebook:

1. If you are deleting the default notebook, be sure to set a new default notebook, as described in the previous section "Setting the Default Notebook," before deleting the old one.
2. Close all Cyberdog windows. (This step applies to the b2 version of Cyberdog, but won't be necessary in later releases.)
3. Drag the notebook to the Trash.

Using the Log

The Log is a record of Internet sites you've visited, including Web sites, FTP sites, newsgroups, and picture and text files. You can drag items from the Log to a notebook and to the Macintosh desktop.

Cyberdog automatically updates the Log, keeping track of each site you visit. When you disconnect and then reconnect to the Internet, the Log from previous sessions is maintained. The Log holds up to 200 entries, dropping the oldest entries drop off the end of the list.

You can sort items in the Log by any of these methods:

- name (alphabetical), with items in alphabetical order
- time (chronological), with items in chronological order from most recent to oldest. If you go to a particular site more than once, only one item shows up in the Log.
- navigation path (hierarchical), which gives a categorical grouping according

to the Internet server and path name. This view gives the server name at the top of each category, then lists sites within that server.

Deleting a Log entry

Cyberdog automatically adds entries to the Log, but you can delete any Log entries at any time. To delete entries:

1. Click the Log button in the Starting Point window.
2. Scroll to the Log entry you want to delete and select it. To select multiple items, hold down the Shift key as you click each item.
3. Press the Delete key or choose Clear from the Edit menu.

Exploring the Internet

The Cyberdog Internet Explorer page contains basic information about "surfing" the World Wide Web, plus links to Internet sites that the Cyberdog team finds especially appealing. There's also a link to information about the Cyberdog team,

To connect to the Cyberdog Internet Explorer page, click the Explore button in the Starting Points window. A small opening window and moving dog icon appear, indicating that your computer is in the process of connecting. The message next to the icon indicates which phase of the connection is in progress. To cancel the connection, click the dog icon.

When enough information has arrived, the window expands to full size and displays the Cyberdog Internet Explorer page.

Searching for Information on the Internet

The Search button in the Cyberdog Starting Point window connects you to the Cyberdog Internet Search page on the World Wide Web. This page offers a choice of different search engines. The typical search engine lets you enter one or more words, or "strings," then searches for instances of that word in all the Internet sites it can find. This particular engine searches only World Wide Web, Gopher, FTP services, and newsgroups; it does not search mail.

Receiving and Sending Mail

With Cyberdog, you can embed any file inside your messages, open files and URLs from inside messages, and automatically sort and filter mail. Cyberdog also provides the same message and sending formats for both e-mail and newsgroups. E-mail and newsgroups use common headers and text areas that behave consistently, and both allow styled text and embedded objects.

Setting Up Mail

In order to use Cyberdog mail, you first need an Internet mail account that uses the POP (for receiving mail) / SMTP (for sending mail) protocols. Your Internet service provider can give you the information you need to setup this up.

To check whether Cyberdog mail is already set up, in the Cyberdog Starting Point window, click the button on the right above Discuss (the button with the mailbox). If you have already been using a mail application with mail preferences already set up in Internet Config, such as Eudora, Cyberdog opens the Mail Trays window and displays an In Tray corresponding to that Internet mail account. You don't need to take any further steps to set up mail.

If Cyberdog prompts you to use the Connect To command from the Cyberdog menu, or if there is no In Tray in your Mail Trays window, you need to set up mail.

To set up Cyberdog mail:

1. In the Cyberdog Starting Point window, click the button on the right above Discuss (the button with the mailbox).
2. From the Cyberdog menu, choose Connect To.
3. Fill in the information in the Mail dialog box.
4. Click OK. Cyberdog sets up information for the mail account, and opens the In Tray window for that account.
5. From the Edit menu, you can choose Cyberdog Preferences and enter your preferences for receiving mail and working with messages.

Setting up additional accounts

If you have multiple mail accounts, follow the steps in the previous section to set up an In Tray for each mail account.

Downloading and reading mail

To download mail from your Internet mail server:

- From the Mail/News menu, choose Check Mail. Cyberdog connects to the mail server and immediately downloads any messages.

Or, to download mail automatically:

1. In the Mail Trays window, select the desired In Tray.
2. From the Trays menu, choose Account Info.
3. In the dialog box that opens, specify whether you want mail downloaded at specific time intervals, or whenever the In Tray is opened.

Sending Mail

To compose and send a mail message:

1. From the Mail/News menu, choose New Message.

Or:

Open a received message and click the Reply button or the Forward button at the top of the message window.

Or:

Double-click an e-mail address that you saved in a notebook or on the Macintosh desktop, or click a mail URL on any World Wide Web page.

2. Type in your message. You can embed any file by dragging it in to the text area of a message. You can use any font or color of text you choose, but keep in mind that the recipient's mail application might affect the look of your message.

3. You can create mail stationery by saving the message using the Letterheads menuitem in the Message menu. The information in the message, such as letterhead, favorite URLs, and frequently-used addresses automatically appears whenever you later select this file in the Letterhead dialog that opens when you request a new message.

4. From the Message menu, choose either Send Now or Send Later. Send Now causes Cyberdog to immediately connect to the mail server and send your message. Send Later places the message in the Out Tray but doesn't send it until you select Send Now at some later time.

5. Close the message. Cyberdog prompts you to indicate whether you'd like to save the message as a file on your Macintosh.

Sorting and filtering mail

If you send or receive large amounts of mail, you can use Cyberdog mail handlers to simplify and streamline your mail processing. For example, you can use a mail handler to automatically direct all mail from the University of California in to your UC mail tray. Or, you can have Cyberdog place all messages with "Australia" or "Travel" in the subject in your Vacation mail tray.

To set up mail handling, choose Mail Handlers from the Mail/News menu. In the dialog box appears, you can define what parts of the mail message you want Cyberdog to look at, and specify the mail tray that you want to receive a particular type of mail (be sure to create any personal mail trays you might want to filter mail to before you setup your mail handlers).

Searching through mail messages

You can search through all your messages for particular text or information. For example, you may want to collect together all the messages about a certain topic (say, "Our Trip to Hawaii"). Even if these have been saved in different folders, the search facility will find all messages containing, say, the text "Hawaii" and list them for you.

To search through your mail messages:

1. From the Mail/News menu, choose Search in Messages.
2. In the Search dialog box that appears, specify which trays to search in, what text to look for, or a received date.

The search returns a "relevance-ranked" list, which means that the more times the criteria you specified were found in a message, the higher that message will be in the list.

Reading Newsgroup Articles

Cyberdog is preconfigured to connect to some newsgroups of general interest.

To view the articles within a newsgroup:

1. Click the News button above the Discuss label.
2. Click the triangle to display the list of newsgroups that are already available.

To follow a discussion in a newsgroup, drag the item from the Newsgroup window in to your notebook. Your notebook will keep track of the messages you've read. Be sure to save your notebook. Note that if you read newsgroups in your newsgroup window instead of from your notebook, each time you close the window Cyberdog loses track of which messages you've read.

Subscribing to additional newsgroups

To subscribe to a new newsgroup:

1. Choose Connect To from the Cyberdog menu.
2. Fill in the server information. This can be a URL (Web address).
3. Select Choices. The newsgroup appears in the Newsgroups window.

To subscribe to individual newsgroups, drag them from the window to your notebook.

Sorting and filtering news articles

You can use handlers to sort and filter mail messages, much the same way as you can sort and filter e-mail. This enables you to filter out articles that you don't want to read.

To set up a news handler:

1. From the Mail/News menu, choose Create News Handler.
2. Select the news group or discussion you want the handler to apply to.
3. From the Mail/News menu, select Apply to Selection.

..TIL19802-Getting_Started_With_Cyberdog_1-0_File_5-96_(TA35495).pdf

If you want display articles you've already read, or articles that you've filtered out, select Display Read or Display Unwanted Items in the Trays menu.

Handlers will work automatically each time you open a newsgroup. Note that only handlers that apply to that newsgroup or to All newsgroups will be used to filter in that particular group.

Searching newsgroups

You can use the Search button on the Starting Point screen to search newsgroup titles, but not the content of individual articles within a newsgroup. After you enter the Search command, Cyberdog displays all the groups that match your search criteria. You can save the newsgroups that interest you by dragging them to a notebook.

Overview of OpenDoc

Although you don't need to know anything about OpenDoc to use Cyberdog, this section provides a brief introduction for you if you're interested in the software architecture that underlies Cyberdog.

OpenDoc is Apple's new component technology for object embedding. OpenDoc changes your experience of the Macintosh in three main ways:

- Object embedding

OpenDoc allows computer objects, such as pictures, command buttons, and even windows, to be embedded inside other objects. The Cyberdog Starting Point window, which appears when you first launch Cyberdog, is an example of a container document with embedded buttons, which are OpenDoc parts. The title is an embedded picture, the six buttons are embedded "cyberbuttons," and the button labels are embedded text.

- Interchangeable software parts

Each of Cyberdog's main parts (listed in the previous section, "Overview of Cyberdog") is a piece of software that is fully interchangeable with other "Cyber-savvy" software. As more parts become available from Apple and other developers, you will be able to drop other Internet facilities into Cyberdog and use them seamlessly in combination with what's already there.

- User interface changes

These OpenDoc changes to Macintosh menus show up in Cyberdog:

- the Document menu replaces the File menu
- the Close command replaces the Quit command
- menus change depending on which part is active

For more information about OpenDoc, check this site:

<http://opendoc.apple.com>

UNIX vi Editor: Basic Overview of Commands (5/96)

Revised: 5/15/96
Security: Everyone

UNIX vi Editor: Basic Overview of Commands (5/96)

Article Created: 15 May 1996

TOPIC -----

This article provides a basic overview of the UNIX vi editor.

DISCUSSION -----

This is just an overview of some of what vi (pronounced vee-eye) can do. It is by no means an exhaustive coverage of this workhorse of the UNIX community. Although quite old, vi has lasted because it's consistent across platforms, very powerful, simple, and much easier to use than 'ed' in its line editor mode, called ex, when doing system file repair. Think of ex as vi with only one line visible at a time. There is also read only vi, called view.

vi has 3 modes, command mode, insert mode, and line mode (also known as 'ex' mode). You are in command mode when you first start vi. You enter insert mode when you enter one of the several insert commands. Line or ex mode is entered from command mode by typing a colon ':', which brings you to a command line at the bottom of the screen. Since it's a full screen editor, vi needs to have a correct display variable set; if it does not understand the display environment, vi will enter into ex instead.

Insert Modes: (Use ESC to get back to command mode.)

i = insert before cursor, a = append after cursor.
I = Insert at beginning of line. A = Append to end of current line.
o = open blank line below cursor for text, O = above line open.
s = delete character at cursor and substitute text.
S = delete line and substitute text.
R = overstrike existing characters with new characters.

Edit Commands:

cw = change a word (overwrite mode). ESC to exit.
cc = change the entire current line. Exit with ESC.

C = change from current position to end of line, same as c\$.
r = replace one character
dw = delete word. dd = delete current line.
D = delete from current position to end of line.
x = delete a character at current position.
X = delete character before cursor (like a backspace).
ZZ = write file and quit vi.

Color LW 12/600 PS: User's Guide Incorrect About RAM (2/97)

Revised: 2/26/97
Security: Everyone

Color LW 12/600 PS: User's Guide Incorrect About RAM (2/97)

Article Created: 15 May 1996
Article Reviewed/Updated: 26 February 1997

TOPIC -----

In the Color LaserWriter 12/600 PS User's Guide, it states that 1, 8, or 16MB SIMMS can be used. However, other sources state that only 1, 4, or 16MB SIMMS can be used. Which is correct?

DISCUSSION -----

The Color LaserWriter 12/600 PS User's Guide is incorrect. You cannot use 8MB SIMMS in the Color LaserWriter 12/600 PS printer. The Tech Info library article titled "CLW 12/600 PS & CLW 12/660 PS: Memory Configuration" lists the various memory configurations you can use in the printer.

Apple CD-ROM: Eject Button Disabled w/ Mounted Volumes (5/96)

Revised: 5/15/96
Security: Everyone

Apple CD-ROM: Eject Button Disabled w/ Mounted Volumes (5/96)

=====

Article Created: 15 May 1996

TOPIC -----

My Macintosh computer has a built-in CD-ROM. When I press the eject button, the CD-ROM disc is not ejecting. Why?

DISCUSSION -----

When a CD-ROM disc is being used by the Mac OS, the disc is considered a mounted volume. The eject button is disabled on all mounted volumes. The correct procedure for ejecting a CD-ROM disc from the drive is the same as any mounted volume, either drag the disc icon to the trash, or use the Put Away command from the File Menu (cmd-Y).

NSI 1.5.1 and System 7.5 Update 2.0 (5/96)

Revised: 5/15/96
Security: Everyone

NSI 1.5.1 and System 7.5 Update 2.0 (5/96)

=====

Article Created: 15 May 1996

TOPIC -----

Should I, or do I need to install the Network Software Installer (NSI) 1.5.1 after I have installed the System 7.5 Update 2.0?

DISCUSSION -----

No, you should not install NSI 1.5.1 after updating to System 7.5.3 with System 7.5 Update 2.0. In the System 7.5 Update 2.0 Read Me it states:

"Files no longer needed
=====

The Update automatically deletes the files listed below -- unless you renamed any of them, in which case, you should remove the files.

•• Several standalone files are now merged into the System 7.5 Update enabler or the System file. This update deletes the old (standalone) versions of the following files:

- ...
- Network Software Installer (v1.5.1 and later)"

NSI 1.5.1 should be used with System 7.0 to System 7.5.1.

Apple Modem Tool: Maximum throughput (12/96)

Revised: 12/3/96
Security: Everyone

Apple Modem Tool: Maximum throughput (12/96)

=====

Article Created: 16 May 1996
Article Reviewed/Updated: 3 December 1996

TOPIC -----

What is the maximum throughput of the Apple Modem Tool?

DISCUSSION -----

The original serial port driver for the Macintosh, as documented in Inside Macintosh, only allowed settings of up to 57.6 kbps on the serial ports. This speed is usually not attainable by the older 68xxx Macintosh systems. With the introduction of SerialDMA architecture, present in the 660 AV and 840 AV systems as well as Power Macintosh models (with the exception of the 5200, 6200, 5300, 6300, and PowerBook 5300 systems) it may be possible to drive the serial ports at speeds up to 230.4 kbps.

The SerialDMA 2.0.2 driver documentation describes these higher speed control calls. In the future, we expect to see updated tools that take advantage of these higher speed calls. Since the Macintosh Toolbox only allowed a maximum setting of 57.6 kbps nearly all communications software, such as the Apple Modem Tool and the Serial Tool, use 57.6 kbps as the maximum.

A PC Card modem is not subject to the same limitations as communications through a serial port. Since PC Cards can handle 10 Mbs Ethernet connections it is certain that unless the manufacturer has done some very poor engineering, the only limitation is the ability of the modem to handle the data throughput.

System 7.x: Desktop Rebuilds Automatically (5/96)

Revised: 5/31/96
Security: Everyone

System 7.x: Desktop Rebuilds Automatically (5/96)

Article Created: 20 May 1996
Article Reviewed/Updated: 31 May 1996

TOPIC-----

The following article documents four different scenarios in which a Macintosh computer running System 7.x can rebuild the desktop, or appear to rebuild the desktop, without the Command and Option keys being pressed at startup.

DISCUSSION -----

7.5 PROGRESS BAR APPEARS TO INDICATE THE DESKTOP IS BEING REBUILT

When starting up under System 7.5 it appears that the Macintosh is always rebuilding the desktop. A progress bar that fills in during the startup process creates the perception that the desktop is being rebuilt.

The progress bar is a new feature in System 7.5 that provides feedback on the status of the startup process. The progress bar is not an indication that the desktop is being rebuilt.

If the desktop is actually being rebuilt, either automatically or on demand, you will see in the window the words "Rebuilding Desktop..."

7.X FILE OR FOLDER NAMED "DESKTOP" AT ROOT LEVEL OF HD

Under System 7.x, if the desktop is rebuilt at every restart, it may be because you have a file or folder at the root level of your hard drive named "Desktop." Removing the item named, "Desktop," or renaming it solves the problem. This can also occur if the file or folder is invisible. If this is the case, you will need to make it visible or delete it using a disk or file utility such as ResEdit.

DESKTOP REBUILDS AFTER INSTALLING SYSTEM 7.5

This is a normal feature of System 7.5. But, this should only occur the first time you restart the computer following the installation.

MACINTOSH EASY OPEN AUTOMATICALLY REBUILDS THE DESKTOP

After you have installed System 7.5 and restarted, you may find that your system will rebuild the desktop with subsequent restarts. These additional rebuilds are caused by Macintosh Easy Open (MEO). MEO builds a table of file types, applications, and the translators available to those applications that give them the ability to open different file types.

This modification of the desktop file provides additional information that MEO uses to locate applications that can open various file types.

For Macintosh computers with Macintosh Easy Open, follow these steps to rebuild the desktop properly:

Step 1

Use Extensions Manager to turn off ALL extensions and control panels EXCEPT Macintosh Easy Open.

Step 2

Restart your computer.

Step 3

Hold down the Command (Apple) Key and the Option key until prompted to rebuild the desktop.

Step 4

Let the rebuild completely finish.

Workgroup Server 8550: Drive Options (4/97)

Article Created: 16 May 1996
Article Reviewed/Updated: 11 April 1997

TOPIC -----

Q: What are my options for adding additional drives to the Workgroup Server 8550?

Q: What is special about the bracket that is included in the full height bay at the bottom of the Computer?

Q: Does Apple officially support the installation of half-height drives in the hard drive bracket assembly in the Workgroup Server 8550? I am asking because I want to add a second hard drive; not replace the original drive.

DISCUSSION -----

Q: What are my options for adding additional drives to the Workgroup Server 8550?

A: The workgroup server 8550 has four bays for drives. All 8550s come with a CD-ROM in the top bay (bay number one), a Floppy drive in the bay beneath that (bay number two) , and a Hard Drive in the bottom bay (bay number four). The third bay down can be filled with a DAT drive depending upon the configuration purchased.

Q: What is special about the bracket that is included in the full height bay at the bottom of the Computer?

A: The bottom bay (bay number four) is a full height bay with special hard drive bracket (p/n 922-2253) mounted inside it. This mounting bracket has an additional fan to keep the drive(s) cool. Adding an additional "low profile (1" high)" drive to this bracket does not require a mounting tray, only a screw kit to keep the drive secure.

Note: 922-2253 can be installed into an 8500 or an 8100.

```

End_Graphic

Q: Does Apple officially support the installation of 1/2 height drives in the hard drive bracket assembly in the Workgroup Server 8550? I am asking because I want to add a second hard drive; not replace the original drive.

A: No, Apple will not officially support the installation of half-height hard drives in the Workgroup Server 8550. The special hard drive bracket (p/n 922-2253) will only support the addition of a "low profile (1" high)" drive.

NOTE: Even though it may be possible to physically fit a half-height hard drive in the special hard drive bracket (p/n 922-2253), the screw holes which mount the drive to the bracket will not match up. If you do somehow manage to install this type of drive, Apple will not support its use in your Workgroup Server 8550.

Control Strip: Missing High Resolution Video Options (5/96)

Revised: 5/21/96
Security: Everyone

Control Strip: Missing High Resolution Video Options (5/96)

=====

Article Created: 17 May 1996

TOPIC -----

This article describes the video options in the Control Strip control panel for Macintosh computers connected to high resolution monitors.

The Control Strip is missing the 1280x960 and 1280x1024 resolution options since I upgraded to 7.5.3 with System 7.5 Update 2.0. Both options are available in the Monitors & Sound control panel. When I select one of the higher resolutions, it shows up in the Control Strip until I change the resolution to a lower resolution. I am unable to get both high resolution options to show in Control Strip at the same time.

DISCUSSION -----

The current design of the Control Strip control panel dictates that it will only show the 'standard' resolutions for the monitor. The 'extended' or highest resolutions (usually less than 72 dpi) will not be listed in the Control Strip. Therefore, in this particular case the 1280x960 and 1280x1024 resolutions will be missing. Apple Engineering is investigating this issue. There is no known information as to if or when a change this issue will be fixed.

PCI-Based DOS Compatibility Card: Read Me (5/96)

Revised: 5/17/96
Security: Everyone

PCI-Based DOS Compatibility Card: Read Me (5/96)

=====

Article Created: 17 May 1996

TOPIC -----

This article contains the Readme file for the PCI-based DOS Compatibility Card.

DISCUSSION -----

Important Information for users of

- PC Compatibility Card (for use with Macintosh models with a PCI expansion slot)
- DOS Compatibility Software Update

This document provides late-breaking information that could not be included in the PC Compatibility Card User's Manual or in the DOS Compatibility Software Update User's Manual.

Be sure to read the first section, "Before You Install," before you install the Compatibility Card software. You can read the rest of this document later.

Contents

- Before You Install
- Third-Party Applications
- PC System
- Macintosh System
- Memory
- Printing
- Networking
- Shared Folders and Disks
- PC Clipboard
- Video
- Technical Support
- User's Manual Corrections

Before You Install

System Software

If you are using a Power Macintosh or Performa 6100 series DOS Compatible System, you can use Operating System 7.1.2 or 7.5.3 with the DOS Compatibility Software Update.

If you are using a Macintosh Performa 630, Quadra 630, or Performa 640CD DOS Compatible, you should use System 7.5.3 with the DOS Compatibility Software Update.

If you are currently using System 7.5, 7.5.1, or 7.5.2, you should install the System 7.5 Update 2.0 to update to System 7.5.3. You can order System 7.5 Update 2.0 on a CD or a high density floppy disk set for \$13 shipping/handling plus tax from the Apple Order Center by calling 1-800-293-6617, extension 984.

For PC Compatibility Card users, System 7.5 Update 2.0 is on the PC Compatibility Card Mac OS Software CD. To install the update, follow the instructions in the PC Compatibility Card User's Manual.

External PC-Formatted SCSI Devices

If you use a dedicated PC-formatted partition or SCSI device instead of a drive container, you may experience some disk read/write errors. Apple recommends using drive containers on Macintosh-formatted partitions or SCSI devices as your primary method of data storage.

Installing Windows 95 Operating System

Follow these guidelines when you install Windows 95 on your system:

- Lock your installation disks.
- Select "Continue" instead of "Retry" at the end of disk 2.
- If you choose to make a startup disk, make sure the disk is already formatted. An unformatted disk will not be recognized.
- After you are done with the installation, refer to the PC Compatibility Card User's Manual for information about setting up printing. During installation, do not print the test page when you are prompted to do so.

Mouse Drivers 9.01

For PC Compatibility Card users, Mouse Drivers 9.01 is available on the PC Utilities CD. To install the mouse drivers, run SETUP.EXE in the MSMOUSE directory. If you are using Windows 3.1 or Windows for Workgroups, install both the DOS and Windows mouse drivers. If you are using Windows 95 or DOS 6.22, install the DOS mouse driver only.

When you install the DOS mouse driver, the installer may display an error message indicating that it could not find a mouse attached to the computer. You can ignore the message if your mouse is properly connected to an ADB port on your computer or keyboard.

Online Help in the PC Environment

You can install online Help for the PC environment when you install the support software. If you install Help, it will be available in the PC environment in the HELP directory in the directory where Apple software is installed.

To start Help in Windows 95:

1. Open "My Computer."
2. Open the C drive.
3. Open the Apple software folder. (The default folder name is "Apple.")
4. Open the Help folder.
5. Double-click the SETUPHELP application.

To start Help in Windows:

1. In the Program Manager, choose Run from the File menu.
2. Type C:\APPLE\HELP\SETUPHELP.EXE and then click OK.

Third-Party Applications

Connectix RAM Doubler

Do not use RAM Doubler and the PC Compatibility Card software together. They are not compatible.

Symantec AntiVirus for Macintosh

If Symantec AntiVirus for Macintosh (SAM) is installed and you mount a drive container, your screen may appear to freeze for a few minutes while SAM scans the container for viruses. The drive container will mount once the scan is complete.

Microsoft Backup

In Windows 95, you cannot use Microsoft Backup because it needs a PC floppy drive controller that does not exist in your Macintosh. Instead, use a Macintosh backup program to back up your PC container file.

However, you can use Microsoft Backup in Windows 3.1 or Windows for Workgroups. To do so, configure the backup manually by following these steps:

1. Add the following line to the [386enh] section of your SYSTEM.INI file:

```
device=vfintd.386
```

Your SYSTEM.INI file is in the WINDOWS directory.

2. Start the Microsoft Backup program.
3. Click "No" in the Auto-configure dialog box.

4. In the Configuration Window, select "1.44 Mb 3.5" in the Drive A: list box.

You may also click "Configure" from the standard toolbar at the top. Do not click the Compatibility Test. button because it may cause a system "freeze."

5. Click Backup on the standard toolbar.

6. If you are backing up to floppy disks, choose "MS-DOS Path" from the Backup To: list box. Type "A:\\" in the second list box that appears.

You can type a different path to back up to a network device.

7. Continue with your back up.

When you use the Compare or Restore options, you must choose "MS-DOS Path" in the Compare From and Restore From list boxes, respectively.

Insignia SoftWindows and Soft PC

You can use drive containers created with SoftWindows or Soft PC, but you will not be able to boot from them. When you select a container created with SoftWindows or Soft PC, be sure to choose a drive letter other than C.

Windows PaintBrush

Prior to switching to the Macintosh environment, make sure that a menu is not pulled down in either PaintBrush for Windows 3.1 or PaintBrush for Windows for Workgroups. When you switch back to the PC environment, the portion of a menu that overlaps your painting may inadvertently get incorporated into the painting.

Other Programs

Apple recommends using only the memory management programs that are included with DOS or Windows. Do not use third-party memory management programs.

A program that attempts to directly control the floppy controller (such as a backup program) will not work properly.

Any program that sends data to the parallel port during setup or initialization may cause a blank page to print on your printer.

Some utility programs may incorrectly report the clock speed of the Cyrix 5x86 microprocessor on the 7-inch PC Compatibility Card. This may occur on any PC that uses this microprocessor.

PC System

Shut Down Properly

IMPORTANT Be sure to quit all open PC applications and exit Windows before shutting down the PC or the Macintosh. Failing to do so will result in the loss of any unsaved data and might result in corruption of the drive container or

partition.

When you need to reboot the PC in the PC environment, use the "warm boot" keyboard shortcut instead of the "cold boot" shortcut whenever possible. You should only cold boot the PC environment when warm booting doesn't work. (Cold-booting erases cached data and may corrupt disk data.)

To warm boot the PC, press Control-Alt (Option)-Del.

To cold boot the PC, press Command-Control-Alt-Del.

Symantec Norton AntiVirus for Windows 95

Before you change the number of display colors in the Display Settings control panel, turn off Norton AntiVirus Auto-Protect by double-clicking its icon in the Task bar and clicking Disable in the dialog box that appears.

Formatting disks or creating a Rescue disk may not work properly if Norton AntiVirus is installed. If you encounter a problem, do the following:

1. Double-click the "Norton AntiVirus Auto-Protect" icon in the Task bar.
2. Click Options, and then click Advanced.
3. Change the "Low-level format of hard disk" option to "Allow," and then click OK.

QuickTime for Windows

When playing QuickTime movies in the PC environment, you may notice synchronization problems between the audio and video.

International Keyboard Support

If you are using an international keyboard, be sure to install and use the keyboard files on the PC Utilities CD. (The supported languages vary from country to country.) The keyboard files that come with Windows and Windows 95 may not work with your keyboard.

Using a CD-ROM Drive

Currently, the PC Compatibility Card only recognizes the following types of CDs: PC format (ISO 9660), dual format (disks formatted for both the Macintosh and PCs), and audio. Some specialized formats are not supported.

Using a Modem

If you are having problems using a modem with Windows 95, you may be able to correct the problems by disabling the "Use flow control" or "Use error control" options for the modem. To do so, follow these steps:

1. Click the Start button, choose the Settings menu item, and then choose Control Panel.
2. Double-click the Modem icon.

3. Click the Properties button.
4. Select the Connection tab in the dialog box that appears.
5. Click the Advanced button
6. Turn off the "Use flow control" or "Use error control" options, and click OK.

Also, make sure to set the modem speed to 19200 baud or less.

Macintosh System

Starting Up the PC and Macintosh Environments

Allow the Macintosh to completely finish rebuilding the desktop before attempting to switch to the PC environment. If you switch during the rebuilding of the desktop, a system "freeze" could occur.

Also, the Energy dialog box may appear each time you start your Macintosh; you can turn off this message at startup by opening and closing the Energy Saver control panel.

If you set up your Macintosh to switch to the PC environment on startup, disable the shut down warning in the General Controls control panel. Otherwise, you may have to wait for your Macintosh to start up when you switch back to the Macintosh environment.

To disable the shut down warning:

1. Choose Control Panels from the Apple menu.
2. Double click General Controls to open it.
3. In the Shut Down Warning area, turn off the "Warn me if computer was shut down improperly" checkbox.
4. Close the General Controls window.

Working with Locked PC Containers

You cannot boot from a locked PC container, a PC container that is open on your desktop, or a PC container that is on a write-protected file server.

You may not be able to mount a locked PC container if file sharing is turned on. You can correct the problem by either unlocking the PC container or turning off file sharing.

Configuring Serial Ports in PC Setup Control Panel

After mapping and remapping a PC COM port to one of the Macintosh serial ports, you may have to restart the PC and the Macintosh for the remapping to take effect.

If you are using Apple Remote Access (ARA) 2.0 or 2.0.1, you may not be able to start your Macintosh properly after mapping a PC COM port to a Macintosh serial

port. To correct the problem, restart while holding down the Shift key to temporarily turn off all system extensions. Then remove the Serial Port Arbitrator from the Extensions folder inside your System Folder, and restart your computer. (Prior to using ARA, unmap the PC COM port and restart your Macintosh.)

You can also correct this problem by upgrading to ARA 2.1 when it is available.

Memory

Some DIMMs (dual inline memory modules) will not work with the PC Compatibility Card. When you purchase memory, request Fast Page Mode memory instead of EDO (extended data output) memory.

Printing

Apple LaserWriter Driver

If you are using a PostScript printer, you should install and use the most recent version of the Apple LaserWriter printer driver software. The current version number is 8.3. Older versions may generate inverted images when printing from the PC environment. Apple LaserWriter 8.3 comes with System 7.5 Update 2.0. It is also available separately on the Apple World Wide Web site.

Windows 95 Add Printer Wizard

When you use the Add Printer Wizard to set up a printer, do not print a test sheet until the printer is configured according to the instructions in your user's manual. Then you can print a test sheet by doing the following:

1. In the Printers window, click the icon of the printer you just added.
2. Choose Properties from the Printer menu.
3. In the dialog box that appears, click Print Test Page.

LaserWriter Select 300 and Personal LaserWriter 300 Printers

The LaserWriter Select 300 and Personal LaserWriter 300 printers are not fully supported. Files printed in the PC environment may not print properly on these printer models.

PostScript Printing

When printing to a PostScript printer from the PC environment, be sure to print one file at a time. Printing multiple files may cause a PostScript error. To verify that the file has finished printing, check the Windows 95 Printer queue.

Epson Emulation

Some documents may not print properly from the PC environment to a non-PostScript printer using Epson emulation. Here are some suggestions for correcting common problems. For additional information, see the section on

setting printer options in the PC Compatibility Card User's Manual.

Problem: Text near the top and bottom of each page doesn't print or is cut off, or text that should print at the bottom of one page prints on the next page.

Solution: Try choosing "No gaps between pages" in the PC Print Spooler Preferences dialog box, and try printing again. (When you print after choosing this option, the PC Print Spooler software will print 66 lines per page instead of 60 lines per page.)

Problem: You have chosen "No gaps between pages" in the PC Print Spooler Preferences dialog box, but text near the top and bottom of each page still doesn't print or is cut off.

Solution: Most laser and ink jet printers cannot print close to the edges of a page. Find out what the minimum margins are for your printer. (Look for this information in the specifications section of the manual that came with your printer.) Then set the top and bottom margins to at least these amounts in the DOS or Windows application from which you are printing.

Printers that Support the "Printer Specific" Option

If you are using the PowerPrint package from GDT Softworks to print on a PC-compatible parallel printer, you should choose Printer Specific in the PC Print Spooler Preferences dialog box. Currently, the PowerPrint package is the only printer driver that supports the "Printer Specific" option.

Saving a Printer File

To save a printer file such as a PostScript file in the PC environment, use the option in your Windows printer driver to print to a file. Do not map a PC COM port to a text file in the PC Setup control panel, and then print to that port in the PC environment.

Networking

Windows for Workgroups TCP/IP and Windows 95

When upgrading from Windows for Workgroups to Windows 95, make sure to install the Windows 95 TCP/IP stack. You may have problems using the Windows for Workgroups TCP/IP stack with Windows 95.

Network Drivers

The MacODI and MacNDIS drivers are in the root directory on the PC Software floppy disk.

Windows 95 PROTOCOL.INI File

If an error message appears stating that there are illegal decimal characters in the PROTOCOL.INI file, the Windows 95 Network control panel may have incorrectly removed some of the double quotes necessary within the file. (The MacNDIS\$ section in PROTOCOL.INI has some lines with double quotes, placed there by the

SETNET utility.) If you modify network settings with the Network control panel, it removes the double quotes from the file. To correct the problem, restore the double quotes in the file.

Use MacODI with Netware Client 32

In Windows 95, use the MacODI driver to connect a Netware 32-bit client to a Netware 4.1 server.

Using ODI with Windows 95

You may experience system "freezes" if you are using NetBEUI or TCP/IP with ODI in Windows 95. To correct this problem, delete the following line from the STARTNET.BAT file in the NWCLIENT directory:

```
C:\WINDOWS\ODIHL.P.EXE
```

Also, add the above line to the end of your AUTOEXEC.BAT file.

Shared Folders and Disks

Sharing Floppy Disks and CDs is not Supported

A floppy disk or a CD should not be set up as a shared folder between the Macintosh and PC environments. This is unsupported and can cause unpredictable results.

Adding/Removing Shared Folders in Windows 95

When you add or remove a Shared Folder, the View in "My Computer" does not immediately change. It requires two refreshes to correctly update the Shared Folder status.

Opening or Saving Shared Folder Files

With some Windows 95 programs, you may not be able to open or save files in a shared folder. You may have to move a file out of the shared folder before you can open it, or save a file to a different location and then move it into the shared folder.

In Windows 3.1 or Windows for Workgroups, you cannot save a file to a shared folder that is empty. To work around this problem, type a full path and filename into the Save As dialog box, or keep at least one file in a shared folder.

Naming Shared Folders

When you name a folder in the Macintosh environment that you intend to share with the PC environment, you may want the name to be within the DOS 8.3 character filename guidelines. Otherwise, the sharing software will truncate and translate name to fit the guidelines. For more information about naming files, see your DOS manual.

Network Disks as Shared Folders

If you set up a shared disk on a network as a shared folder and later the network configuration changes, you may continue to be prompted with a dialog box at startup to mount a shared disk that no longer exists on the network. To prevent the dialog box from appearing, reassign the drive letter to a new drive. If you cannot remember the drive letter, drag the PC Setup Preferences file to the Trash.

PC Clipboard

Using Compressed Images in the Clipboard

In some cases, you may need to expand a compressed image file in the Macintosh environment to correctly transfer the image to the PC environment.

Tips

If you are having trouble copying and pasting text or images between the Macintosh and the PC environments, try the following tips:

- Instead of using the Paste command, use the Paste Special command if it is available in the application you are pasting into.
- If you cannot paste an image into a word processing program in the PC environment, try pasting the image into a graphics program, such as PaintBrush. Then, copy the image to the clipboard from the graphics program and try pasting into your word processing program.
- Instead of copying and pasting, use a shared folder to transfer an entire file from one environment to another. Some Macintosh and Windows programs can open files created on other platforms. For example, ClarisWorks for Windows can open ClarisWorks files created on a Macintosh, and vice versa. Even if you are using two different programs, you may be able to save a file in a common file format that both programs understand, such as RTF for text, and EPS or TIFF for graphics. (Check the manuals that came with your programs to see if they support common file formats.)
- If you must use the clipboard to transfer a lot of data or a large graphic, try transferring the data in smaller pieces or making more memory available to the application. For more information on increasing a program's memory, see the "Memory" topic of Macintosh Guide, available in the Guide (?) menu.
- If you are copying and pasting a PhotoCD image, make sure you are copying an expanded version of the image.

Large Bitmap Transfers

If you are transferring large bitmap images from the PC to the Macintosh environment, you may have to increase the memory allocated to the PC Clipboard application. To increase the memory allocation:

1. Open the System Folder, then open the Extensions folder.

2. Select the PC Clipboard icon, open the File menu, and choose Get Info.
3. In the Preferred Size text box, enter a larger memory allocation, such as 1000K.
4. Close the PC Clipboard Info window.

Pasting Graphics Created in Microsoft Word 6.0 for Macintosh

If you have difficulty copying a graphic from a Microsoft Word 6.0 document in the Macintosh environment and pasting it into the PC environment, try this method instead:

1. Select the graphic in Word 6.0 and choose Cut from the Edit menu.
2. Place an insertion point in the Word 6.0 document, open the Edit menu, and choose Paste Special.
3. In the Paste Special dialog box, select Picture format and click OK.
4. Select the graphic you just pasted, and choose either Cut or Copy from the Edit menu.
5. Switch to the PC environment, and try pasting the graphic.

Video

For best results, use Apple multiple scan monitors with the PC Compatibility Card.

Video Driver switching in Windows 95

Some 16 color 640x480 modes use the Windows 95 video drivers instead of the ATI video drivers. The ATI options will not appear in the control panel when the Windows 95 video drivers are being used. To make the ATI options available, change the color depth to a higher value, such as 256 colors.

Monitor Adapters

Selecting a "pass-through" mode on a monitor adapter may cause the PC Compatibility Card to incorrectly sense the monitor. When the PC Compatibility Card does not sense the monitor because of an incorrect monitor adapter setting, it will automatically assume that the monitor is a 14" RGB monitor and restrict the resolution to 640x480. Make sure that the monitor adapter correctly represents the attached monitor.

AppleVision 1705 Display

The AppleVision 1705 Display will only appear to the PC as a DDC monitor if you use the optional 1705 VGA adapter cable and a VGA-to-Macintosh video adapter to connect the display to the PC Compatibility Card. Using the standard Apple-supplied cable will result in the monitor being identified as a 17" multiscan monitor. Although the PC Setup control panel lists Multiscan 17" in

the Displays pop-up menu, you should select AppleVision 1705 in the Windows Display control panel.

AppleVision 1710 and 1710AV Displays

If the PC Setup Control Panel indicates an Apple 14" monitor when an AppleVision 1710AV monitor is connected, do the following:

- Reinstall the AppleVision software that came with the monitor.
- If you are using only this monitor, or you are connecting two monitors with the AppleVision 1710AV used to view the Macintosh environment, make sure to connect one ADB cable between your monitor and your computer, and another ADB cable between the port on the monitor and your keyboard.

Macintosh 21" Color Display

If you are using the Macintosh 21" Color Display with Windows 95, do not select a 24 bit driver in the Display control panel, even though it is an available selection. Select an 8 or 16 bit driver instead. Choosing a 24 bit driver may cause the PC environment to boot improperly.

Screen Display

When used with some monitors, a particular monitor resolution (such as 640x480) may cause the display to show a smaller viewable area surrounded by a black border. To correct the problem, try selecting a different monitor resolution.

If your PC Compatibility Card has 1MB of video memory installed, then the only refresh rates available at 1280x1024 resolution are interlaced display modes. However, Apple multiple scan monitors and many third-party monitors do not support interlaced display modes. To display 1280x1024 resolution, you may have to upgrade the video memory on the 12" card to 2MB, which supports higher refresh rates.

If you are using a third-party monitor and it does not display properly, try these suggestions to correct the problem:

- Use the Windows 95 Display control panel to select your monitor name. If your monitor name is not available, select the SuperVGA monitor option that matches the maximum resolution supported by your monitor.
- Use the ATI FlexDesk or the Windows 95 control panel to set the refresh rate to 60Hz.
- If the monitor still does not display properly, reduce the resolution.

Fixed Frequency Monitors

Playing a Video for Windows (.AVI) file in full-screen mode may not work properly on a fixed frequency monitor. A multisynchronous or multiple scan monitor will work properly. Refer to the PC Compatibility Card User's Manual for information about supported monitors and video modes.

Fixed frequency monitors do not support video "Mode X" (320x240 resolution), which is primarily used by game programs.

Playing Video Files

When playing real-time based video files or games in the PC environment, you may notice synchronization problems between the audio and video.

Optimizing MPEG playback in Windows 95

You have three ways to optimize MPEG file playback performance in Windows 95; you can adjust virtual memory, CD-ROM caching, and ATI MPEG Player settings. There is no single best way to configure the system. The instructions here show you where to find the configuration files you can use to optimize playback for your particular circumstances.

To adjust virtual memory settings, follow these steps:

1. Click the Start button, open the Settings menu, and choose Control Panel.
2. Double-click the System icon to open it.
3. Click the Performance tab, and click the Virtual Memory button.

There are a variety of options in the Virtual Memory window. These options allow you to let Windows automatically manage your virtual memory, or allow you to set up virtual memory to try and optimize the performance yourself.

4. Click OK when done and close all the open windows.
5. Shut down Windows and restart for your changes to take effect.

To adjust CD-ROM caching settings, follow these steps:

1. Click the Start button, open the Settings menu, and choose Control Panel.
2. Double-click the System icon to open it.
3. Click the Performance tab, and click the File System button.
4. Click the CD-ROM tab.

5. Decrease or increase the size of the Supplemental Cache to optimize performance. Also, choose the speed of your CD-ROM drive from the "Optimize access pattern for" pop-up menu.

6. Click OK.

To set ATI MPEG Player properties, follow these steps:

1. Click the Start button, open the Settings menu, and choose Control Panel.

2. Double-click the Multimedia icon to open it.
3. Click the Advanced tab.
4. Click the plus signs to expand the Multimedia Drivers and Media Control Devices lines.
5. Select ATI MPEG MCI Driver line.
6. Click the Properties button.
7. Click Settings.
8. Change the CPU Utilization, image size, display, and Audio/Video options in the MCI ATI MPEG Configuration window.
9. Click OK to save the settings.

Technical Support

Apple will provide technical support for Apple-branded software and for DOS 6.22 because it is included with the PC Compatibility Card. If you are having a problem with Windows, Windows for Workgroups, or Windows 95, contact Microsoft Product Support. See the support information that came with your Windows package for more information.

User's Manual Corrections

Please note the following corrections in your PC Compatibility Card User's Manual:

- Page 70: The table should indicate that the Apple CD-ROM extension is installed in the Extensions folder.
- Page 77, 79, 174, 175, 176: Each of these pages contains a DOS "CD" command that will not work properly unless you type the following DOS command first:

E: <return>
- Page 87: In the AUTOEXEC.BAT file, omit the line that loads Macshare into high memory. Instead, the line should appear in your CONFIG.SYS file as
INSTALLHIGH=c:\apple\macshare.com.
- Page 90: The PowerPrint package is sold by GDT Softworks, Inc. You can phone GDT at (800) 663-6222 or (604) 473-3600, or visit their worldwide web site at <http://www.gdt.com>.
- Page 111: In "Using Floppy Disk Drives and Floppy Disks," add the following information to the list: "You can only access an unlocked floppy disk in the environment that was active when you inserted the disk."
- Page 142-43: Step 4 of "Installing NetWare Client Software" should be, "Insert the disk containing the NetWare client software and select PC Compatibility

Ethernet Adapter."

- Page 147: Step 2 of "Installing NetBEUI in Windows for Workgroups" should be, "In Windows, open the Network Setup control panel, click Drivers, and click Add Adapter. Then select NetBEUI."
- Page 161: The title of the section should be "Installing Microsoft TCP/IP-32 Protocol Stack in Windows 95." To install IPX/SPX for use with an NDIS driver in Windows 95, see page 159.
- Page 164-65: There is an unnecessary line listed in the PROTOCOL.INI file for using Microsoft TCP/IP with an NDIS driver in Windows for Workgroups. Delete ProtocolDot2="FF,F0,E0" (the thirteenth line).
- Page 169-71: After step 10 in "Running the Network Protocol Setup (SETNET) Utility," the "Important" note is incorrect. It should say, "If you are using ODI with Windows 95, you may need to manually add the following two lines to your PROTOCOL.INI file before running the SETNET utility."

Also, Using PC Sound with the PC Compatibility Card only describes Sound Blaster functionality for DOS and Windows. For information on using Sound Blaster with Windows 95, refer to online help.

PowerBook: Sys 7.5 Update 2.0 Changes (5/96)

Revised: 5/17/96
Security: Everyone

PowerBook: Sys 7.5 Update 2.0 Changes (5/96)

=====

Article Created: 17 May 1996

TOPIC -----

Below is a list of components that have changed from PowerBook 5300 System Software Update to System 7.5.3, by installing System 7.5 Update 2.0. Each component that has changed has been listed, along with a description of what the changes were between the two versions.

DISCUSSION -----

Item	PowerBook 5300 System Software Update	System 7.5 Update 2.0
====	=====	=====

APPLE MENU ITEMS

CHOOSE	7.5	7.5.4
Support for Open Transport.		

FIND FILE	1.1.1	1.1.2
Numerous fixes.		

CONTROL PANELS

APPLE MENU OPTIONS	1.1	1.1.2
--------------------	-----	-------

Fixed a problem with international sorting where items would end up out of order if the script system and the file system had different ideas about sorting order. (Finnish suffered from the problem.)

EXTENSIONS MANAGER	3.0.2	3.0.3
--------------------	-------	-------

3.0.3 made a change so that internal Apple projects find it easier to build a set of extensions for projects. This change will not be seen by end users.

GENERAL CONTROLS

7.5.5

7.5.7

Changed the default setting of the Improper Shutdown dialog to ON. This changed from 7.5.5 to 7.5.6, and then back again with 7.5.7.

LAUNCHER

2.7

2.8

Allow for the selection of an initial default category by name instead of by number. Also changed the default button spacing for the three button sizes so that 9x3 small buttons, 6x2 medium buttons and 4x1 large buttons have exactly the same window size.

MONITORS

7.5.4

7.5.5

This version works on all Macintoshes (except the Plus and Classic). The changes were to make Monitors work with Display Manager 2.0 on pre-7.5.2 CPUs, by merging the 7.5.2 versions with the 7.5 version.

MOUSE

7.5.2

7.5.3

Added back Mouse Tracks and Thick I-Beam cursor to PowerBooks which support them. Mouse 7.5.2 had removed them for all PowerBooks.

NETWORK

3.0.2

3.0.3

Open Transport support. (The network control panel was made OT aware so it will not run if OT is active.)

NETWORK SOFTWARE SELECTOR

This utility allows a user of 68030-, 68040-, and early PowerPC-based computers to choose between Open Transport and classic AppleTalk networking if both are installed. (You must restart the computer for the change to take effect.) PCI-based computers support only Open Transport.

SPEECH

N/A

1.4.1

Allows you to change the default voice and other Speech Manager related settings.

TRACKPAD

7.5.4

7.5.5

Fixes a problem where the mouse and trackpad settings would lose sync over restart on PowerBook 500 series machines.

CONTROL STRIP MODULES

MONITOR BITDEPTH

N/A

1.0

Part of the Control Strip package. It allows the user to easily change the bit depth of a monitor.

MONITOR RESOLUTION

N/A

1.0.1

Support for Display Manager 2.0 on pre-7.5.2 CPUs. (Similar to the Monitors changes.)

EXTENSIONS

EM EXTENSION	3.0.2	3.0.3
--------------	-------	-------

Same as Extensions Manger Control Panel 3.0.3.

ABOUT APPLE GUIDE	1.2	1.3
-------------------	-----	-----

Some wording was changed.

ABOUT COLOR SW PRO CMM	1.0	1.0.1
------------------------	-----	-------

Some wording was changed.

APPLE GUIDE	1.2.7	2.0.2
-------------	-------	-------

- Fixed script system handling by first attempting to use the script code from the current database. This enables better handling of localized database files and fixes a Look For problem in Japan systems.

- Fixed a memory leak (~2k) of an international resource that occurred everytime a database was opened. This occurred in Apple Guide's heap.

- Fixed a bug in <Delete Index> that affected Japanese systems.

- Fixed problems with mixed mode handling of installed coach and context handlers. This occurred on PowerMacs running native Apple Guide 1.2.5 and installing handlers from native or 68K applications.

- Fixed an index bug that originally surfaced on Japanese systems. When multiple mixin files (aka additions) were in use, items would disappear from the index list. The real culprit here was a bug that was dropping every 21st index item from the combined index list from all the mixins in use. This bug would occur on any system software version, not just Japanese.

- Fixed improper handling of international resources that could crash some systems.

- Fixed a problem where mixin files whose gestalt criteria failed on PowerMacs causing Apple Guide to shut down completely. For example, if you are on a PowerMac and a PowerBook mixin was present on the machine, v1.2.5 would completely shut down because that mixin couldn't be used. It now just ignores that mixin and continues running.

- Now built with a 'weak' link to QuickTime. This means that when run on a PowerMac, Apple Guide will continue to run even if QuickTime isn't installed. Previously, 1.2.5 would refuse to start up if QuickTime wasn't present on the machine.

- Added Gestalt selector 'ag_v' to return the current installed version of Apple Guide. Very similar to the 'sysv' result code.

- Added localizable error strings used in various abort msgs.

- Modified index sorting code to default to USACII sorting only if the current script is Roman and the current language is English. Previously, 1.2.5 would default to USASCII on any Roman script system.

..TIL19813-PowerBook-Sys 7-5 Update 2-0 Changes 5-96.pdf

- Fixes an incompatibility with Microsoft Office Manager introduced by Apple Guide version 2.0.
- Fixes a problem which could cause Apple Guide to crash at undetermined points.

```
APPLE MODEM TOOL          1.5          1.5.5
Supports higher speed serial connections (up to 230kb) due to the new
SerialDMA driver which is supported on the Macintosh 680x0 AV and Power
Macintosh desktop machines.
```

APPLESHARE	3.6.1	3.6.1RevB
Set the bundle bit. This fixes a problem where the icon of the AppleShare file might not be displayed correctly.		

FINDER HELP	7.5.3	7.5.5
Just keeping in sync with the Finder.		

FINDER SCRIPTING EXTENSION	7.5.3	7.5.5
Just keeping in sync with the Finder.		

IRTALK 1.2 1.3.1

IRTalk 1.3.1 provides support for Open Transport. A machine that is using IRTalk and has OT installed and turned on, must have IRTalk 1.3 or greater, or a crash will occur.

LASERWRITER 8	8.3.2	8.3.3
A change was made to keep third party applications that fail to call PROpen from crashing when printing.		

MACINTOSH GUIDE	1.2	1.3
A large number of changes and additions were made to the Guide information.		

NETWORK EXTENSION	7.1.3	7.5.5
Keeping in sync with the Finder. Some BlockMove calls were changed to BlockMoveData for speed.		

PB 5300 GUIDE ADDITIONS	1.0	1.3
A large number of changes and additions were made to the Guide information.		

PRINTER DESCRIPTIONS

```

LASERWRITER 16/600 PS-J                N/A                1.1
  Slight changes to printer information for driver usage.

```

LASERWRITER 4/600 PS N/A 1.0

Postscript parameters and printer information for the LW 4/600 PS printer.

LASERWRITER COLOR 12/600 PS N/A 1.1.1
Slight changes to printer information for driver usage.

PRINTER SHARE 1.1.2 1.1.3

..TIL19813-PowerBook-Sys_7-5_Update_2-0_Changes_5-96.pdf

Increased the stack space internally to work with Open Transport. Printer Share 1.1.3 is required to work with Open Transport.

SHORTCUTS

1.2

1.3

A number of small changes were made to ShortCuts, including a few wording changes, as well as some additional tips.

SPEECH MANAGER

1.3

1.4

Previous to version 1.4 of the PlainTalk family of software, all of Apple's text-to-speech software and speech recognition was packaged together in one big installer (and there was no Spanish text-to-speech before version 1.4). As of version 1.4, there are three separate installers: "English Text-to-Speech", "Mexican Spanish Text-to-Speech", and "English Speech Recognition". The text-to-speech installers both install the Speech Manager extension.

VOICES

N/A

Different sounding voices for use with Speech 1.4 (MacinTalk 2 or 3 depending on the CPU).

SYSTEM FOLDER

FINDER

7.5.4

7.5.5

Fixes a crash that would occur when you drag one Zip disk onto another.

SYSTEM 7.5.2 UPDATE

N/A

7.5.3

This replaces the PowerBook 5300/190/2300 Enabler. It includes the following additional bug fixes:

- Fixed a problem with the BatteryPrediction code which could cause a PowerBook to crash when the machine is booted.
- Fixed a problem where At Ease would hang when command-power was depressed without a debugger present.
- Fixed a problem in PowerMgrLib that could cause a crash when turning AppleTalk off, then back on, then opening the Chooser.
- Includes the 2300c track pad update.
- Includes the 7.5.2 Printing Fix.
- Changed a constant (kMaxDepth) from 8 to 16 in MouseTracks.c (part of QuickDraw). This is a test to see whether or not mouse tracks can be turned on based on the screen depth and it was too shallow.
- Fixed a problem where PC cards were left unlocked after waking from sleep, which could lead to possible data loss.
- Fixed a problem with notification manager alerts on all machines. Before the fix, the alerts that involve a flashing icon, could result in the wrong icon being used in the Application Menu after the alert is dismissed. Another of the problems this fixes is that the clock (all machines) and battery level indicator

..TIL19813-PowerBook-Sys_7-5_Update_2-0_Changes_5-96.pdf

(PowerBooks/Duos) would be erased, stay blank briefly, and be redrawn when an alert sound is played.

Mouse Tracks with PowerPC-based PowerBook computers (2/97)

Revised: 2/14/97
Security: Everyone

Mouse Tracks with PowerPC-based PowerBook computers (2/97)

Article Created: 20 May 1996
Article Reviewed/Updated: 14 February 1997

TOPIC -----

This article describes an issue with the Mouse Tracks or Thick I-Beam features in the Mouse control panel with PowerPC-based PowerBook computers.

DISCUSSION -----

If the Mouse Tracks or Thick I-Beam feature is turned on in the Mouse control panel on a PowerPC-based PowerBook* or PowerBook 190 computers when an external display is attached, the external display image will not redraw correctly. The display will show white boxes or images of the cursor when the cursor is moved. The workaround is to turn off Mouse Tracks or Thick I-Beam.

In system prior to System 7.5.3 these options will not be available in the Mouse control panel. On the PowerBook Duo 2300c this occurs when connected to a MiniDock, not a Duo Dock. Apple is investigating this issue. It is not known when or if this will be changed.

* The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, 1400cs and 3400c. Additionally PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

This article was published in the Information Alley on 10 February 1997.

Article Change History:

14 Feb 1997 - Added new computer model.
10 Feb 1997 - Added keyword.
20 Jan 1997 - Added info about 1400 series computers.

PowerBook: No SCSI Disk Mode Symbol (5/96)

Revised: 5/22/96
Security: Everyone

PowerBook: No SCSI Disk Mode Symbol (5/96)

=====

Article Created: 20 May 1996

TOPIC -----

This article describes the startup behavior of PowerBook computers that support SCSI Disk Mode or HD Target Mode.

When I connect a PowerBook 5300 in HD Target Mode to my desktop Macintosh computer I do not get the SCSI disk mode symbol on the PowerBook screen as the manual suggests. Is this a problem?

DISCUSSION -----

The behavior of your PowerBook 5300 computer is normal. Due to power draw or requirements the PowerBook 500, 190, or 5300 series computer screen may remain blank when the PowerBook is powered on.

Power on the PowerBook first. If connected, power on another SCSI device. Last power on the desktop computer. The SCSI disk mode symbol with the SCSI ID number of the PowerBook will appear.

Most PowerBook computers will not exhibit this behavior. It is not an indication of a hardware problem if the SCSI Disk Mode symbol appears after powering on another SCSI device in the chain or the desktop Macintosh computer.

Backing Up a PowerShare Server (5/96)

Revised: 5/20/96
Security: Everyone

Backing Up a PowerShare Server (5/96)

Article Created: 20 May 1996

TOPIC -----

This article describes backing up a PowerShare Server. This information is taken from the "PowerShare Design Guide."

DISCUSSION -----

Mail Servers

Stop the PowerShare mail server application before backing-up any mail data. Because the mail server is always routing messages, it is not possible to get a "snap-shot" without quitting the application. Backup all the data in the PowerShare Mail Data folder. To restore, quit the mail server application, remove all the data in PowerShare Mail data folder, restore to this folder, and restart.

Catalog Servers

To backup a catalog server in single server environment, the server application must first be stopped. Then, all the data in the PowerShare Catalog Data folder can be backed up. To restore, bring down the server, remove the data in the PowerShare Catalog Data folder, restore to this folder, and restart.

In most multi-server environments, backup and restore can be handled via PowerShare replication services. Replication allows copies of folders to exist on many machines. As long as each folder is replicated on at least one other system, a synchronized backup is always available. If any machine is lost, the folders it manages can be replicated back onto it, when it is brought on-line. However, if an off-site backup is required, a bit more planning is needed. For smaller systems, one catalog server must be a master catalog server maintaining all the folders. A backup of this system can be performed by stopping the catalog application and backing-up all the data in the PowerShare Catalog Data folder. In larger systems, where multiple catalog servers might have to be used to store the entire catalog, backup copies of the catalog data is needed on each

machine.

If any one server goes down, use replication to bring it back on-line. If multiple servers are damaged, and one good copy of a folder is not available on any server, then the catalog must be restored onto a master server from tape. Replication can be used to update all the other servers, bringing the system back to operating level.

As long as one catalog server remains up during the backup or restore process, users have access to the system. Even when a folder is missing from a system, they can still have access to any other folder that is available on a running server.

Here are rules for backup and restore in a multi-server PowerShare environment.

- 1) Make sure that a copy of every folder exists on tape, another server, or both.
- 2) When backing-up, stop (Quit) the application. Backup the data in the PowerShare Catalog Data folder.
- 3) When restoring to a server that has crashed, remove all the data in the PowerShare Catalog Data folder. Restore from tape or use replication.

PC Compatibility Cards: Joystick Channel Support (5/96)

Revised: 5/20/96
Security: Everyone

PC Compatibility Cards: Joystick Channel Support (5/96)

=====

Article Created: 20 May 1996

TOPIC -----

Does the joystick port on the PC Compatibility Cards have both joystick channels?

DISCUSSION -----

The PCI-based PC Compatibility Cards support both joystick channels. Many 'enhanced' PC joysticks use both joystick channels to support additional buttons. Since the PC Compatibility Cards have both channels, you can use these joysticks, or with a standard joystick port splitter you can attach two standard PC joysticks.

The DOS Compatibility Cards for the following computers do not support both joystick channels:

Quadra 610 DOS Compatible
Power Macintosh 6100 DOS Compatible
LC 630 DOS Compatible
Performa 640 DOS Compatible

PC Compat Card: Quit Windows Prior to Shutting Down (5/96)

Revised: 5/20/96
Security: Everyone

PC Compat Card: Quit Windows Prior to Shutting Down (5/96)

=====

Article Created: 20 May 1996

TOPIC -----

My Macintosh automatically shuts itself down after the idle time specified in the Energy Saver control panel. I have a PC Compatibility Card installed in this computer, and I understand that I'm supposed to exit Windows before shutting down. Does the Energy Saver control panel do this for me?

DISCUSSION -----

Before shutting down or restarting your computer, you should exit Windows 3.1 or shut down Windows 95. However, the Energy Saver control panel is not able to exit Windows or shut down Windows 95 for you. Since the Energy Saver control panel cannot do this, you should either make sure you shut down or exit Windows before the computer shuts itself off, or you should have the computer put itself to sleep instead of shutting down. To put your Macintosh in the sleep mode instead of shut down do the following:

Step 1

Open the Energy Saver control panel.

Step 2

Click the "Shut down instead of sleeping" checkbox. This removes the checkmark.

Step 3

Close the Energy Saver control panel.

Step 4

Restart your Macintosh computer.

PC Compatibility Card: Troubleshooting COM Port Mapping (5/96)

Revised: 5/20/96
Security: Everyone

PC Compatibility Card: Troubleshooting COM Port Mapping (5/96)

=====

Article Created: 20 May 1996

TOPIC -----

I have a PC Compatibility Card in my Macintosh computer. When I try to map a COM port to one of the Macintosh serial ports in the PC Setup control panel, the selection is dimmed.

DISCUSSION -----

If a serial port is already in use, the PC Setup control panel will not allow you to select that port. To select that port, you need to disable the other software first. Common causes are:

- AppleTalk may be active on that port
- Communications software may be using that port. Fax software that is set to automatically receive a fax will also block out that port
- PC Setup may already have that port mapped on the other COM port selection

PC Compatibility Card: PostScript Errors From Windows 95 (5/96)

=====

Article Created: 20 May 1996

TOPIC -----

I have a Power Macintosh and I am running Windows 95 on my DOS Compatibility Card. When I try to print from Windows 95 to my LaserWriter printer, I get a PostScript error from Mac OS Print Monitor.

DISCUSSION -----

A PostScript error may occur if you print more than one document at a time on the Windows environment. When printing a second job, make sure Windows has already finished sending the first print job.

Also, some of the settings for the Windows 95 printer driver need to be changed from their defaults. Here are the steps to configure your Windows 95 printer driver properly:

Step 1

Open the printer icon for your printer

Step 2

Choose Properties from the File menu

Step 3

Select the tab labeled Details

Step 4

Click Spool Settings

Step 5

Click "Disable bi-directional support for this printer"

Step 6

Click OK

Step 7

Click Port Settings

Step 8

Make sure the box labeled "Check port state before printing" is unchecked

Step 9

Click OK

Step 10

Select the tab labeled PostScript

Step 11

Click Advanced

Step 12

Make sure the boxes labeled "Send CTRL+D before Job" and "Send CTRL+D after Job" are unchecked

Step 13

Click OK

Step 14

Close the Properties window.

PC Compatibility Card: Text Cutoff at Edge of Page (5/96)

Revised: 5/20/96
Security: Everyone

PC Compatibility Card: Text Cutoff at Edge of Page (5/96)

=====

Article Created: 20 May 1996

TOPIC -----

I have a PC Compatibility Card in my Power Macintosh computer. When I print to my QuickDraw printer from the PC side, text near the top and bottom of each page doesn't print or is cut off, or text that should print at the bottom of one page prints on the next page.

DISCUSSION -----

Try choosing "No gaps between pages" in the PC Print Spooler Preferences dialog box, then print again. When you print after choosing this option, the PC Print Spooler software prints 66 lines per page instead of 60 lines per page.

Steps to Select No Gaps Between Pages

=====

Step 1

Go to Extensions folder in System Folder

Step 2

Double-click PC Print Spooler

Step 3

Go to the File menu and select Preferences

Step 4

Select "No gaps between Pages"

Step 5

Click OK

If "No gaps between pages" is selected in the PC Print Spooler Preferences dialog box, but text near the top and bottom of each page still does not print or is cut off, find out the minimum margins for your printer. Most laser and ink jet printers cannot print close to the edges of a page. Then set the top and bottom margins to at least these amounts in the DOS or Windows application you are using.

PC Compatibility Card: Only Built-in Ethernet Supported (5/96)

=====

Article Created: 20 May 1996

TOPIC -----

Can I use a PCI-based Ethernet or Token Ring card with my PC Compatibility Card?

DISCUSSION -----

The PCI-based PC Compatibility Cards support only the built-in Ethernet port on your Power Macintosh computer. On this port, you may run AppleTalk, TCP/IP, IPX/SPX, and/or NetBEUI.

Although the PC Compatibility Card software comes with a Token Ring ODI driver, it has not been fully tested and is not supported.

System 7.5 Update 2.0: Monitors & Sound Gamma Settings (5/96)

Revised: 5/20/96
Security: Everyone

System 7.5 Update 2.0: Monitors & Sound Gamma Settings (5/96)

Article Created: 9 April 1996
Article Reviewed/Updated: 20 May 1996

TOPIC -----

I have a Power Macintosh 7200/75 computer, System 7.5 Update 2.0, Apple Multiple Scan 15 Display. I recently upgraded to System 7.5.3 by installing the System 7.5 Update 2.0.

I am now using the Monitors & Sound control panel. If I change just the Gamma setting, a prefs file is not created and saved. Likewise, if there is an existing prefs file, it is not updated if I change only the Gamma setting. Why is this happening? How can I work around it?

DISCUSSION -----

We were able to reproduce this symptom using a Power Macintosh 7200/75 computer running System Update 2.0 and a 15 Inch Multiple Scan Display.

One workaround we discovered is that if you change both the Resolution as well as the Gamma settings in the Monitors & Sound control panel, it seems to lock in the setting after you restart the computer. This is one way to save the changes you have made.

CameraMan Screen Shots Fill Hard Disk (5/96)

Revised: 5/31/96
Security: Everyone

CameraMan Screen Shots Fill Hard Disk (5/96)

Article Created: 20 May 1996

TOPIC-----

My school purchased HyperCard 2.3.x, which came bundled with Multimedia Utilities & ADDMotion II from Motion Tool Works. Ever since this package has been installed, I have noticed that our available hard drive space has been decreasing rapidly. I have also noticed a frequent clicking sound coming from the computers while the students are using them.

DISCUSSION-----

This is caused by an extension called CameraMan. The CamerMan extension is installed as part of the Multimedia Utilities & ADDMotion II bundle, which is bundled with HyperCard 2.3.x. CameraMan is a product of Motion Tool Works.

CamerMan provides function key shortcuts for features like taking screen shots. These functions would otherwise require more complicated key combinations to execute.

The screen shot feature produces a camera shutter sound as it makes a PICT file of what appears on your screen. Since it only takes one key, students will start pressing the key frequently to produce the sound.

The resulting PICT files will be saved automatically at the top (root) level of your hard drive directory and be labeled "Picture 1". If you keep taking screen shots, you will get "Picture 2", "Picture 3", and so on. These files will eventually take up a significant amount of hard disk space.

CamerMan adds function key shortcuts for other procedures, as well. The function key shortcuts are documented in the following table.

Function Key	Action
=====	=====
F12	take screen shot (PICT)
F13	start recording QT sequence

F14	pause QT recording
F15	top QT recording

The extension can be turned off using the Extensions Manager control panel. To turn off the CameraMan extension, follow these steps.

Step 1

Choose Control Panels from the Apple Menu.

Step 2

Double-click the Extensions Manager icon to open it.

Step 3

Click on the check next to the Cameraman extension to turn it off.

Step 4

Restart your computer.

For additional information on CameraMan or other Motion Tool Works products, contact Motion Tool Works.

AppleShare 4.2.1: File Server Cache Questions & Answers (5/96)

Revised: 5/21/96
Security: Everyone

AppleShare 4.2.1: File Server Cache Questions & Answers (5/96)

=====

Article Created: 21 May 1996

TOPIC -----

This article answers the following questions about AppleShare 4.2.1 cache.

- 1) How does AppleShare 4.2.1 displace files from cache. When cache is full, does one users file get removed when another user opens a file?
- 2) If numerous users open the same file, does that file get cached just once?
- 3) Any difference in icon and folder caching?

DISCUSSION -----

1) Question: How does AppleShare 4.2.1 displace files from cache. When cache is full, does one users file get removed when another user opens a file?

Answer: The AppleShare 4.2.1 cache has been completely redesigned. From the administrator perspective memory is now managed as a single block of memory. There are no longer barriers between one user's portion of cache and any other users.

While the administrator views memory as a single block of memory, that may grow, AppleShare manages it in smaller pieces. It tries to keep as much data in cache as possible. Three things need to happen before a file (or a portion of a file) is displaced from the AppleShare cache:

- A read request must come for data not already in cache.
- AppleShare will attempt to expand the size of its cache.
- The cache expansion request does not succeed because either physical memory is exhausted, or because of the way the administrator has configured cache.

The cache scheme being used is called least recently used (LRU) which is fairly

common. AppleShare examines its blocks of data, and data with the longest unused access time will be cleared out to make room for the new data coming from the disk.

2) Question: If numerous users open the same file, does that file get cached just once?

Answer: Yes, just once. That is the key to AppleShare's new performance. It now makes much better use of memory.

From the end user perspective security is still enforced, but assuming two user's both have access to the same file and are reading it at about the same time, it will only be read into memory once. If the file remains in memory and some time later another user requests the same file, no additional data will be read from disk (since it is already in the cache), this user will get the data more quickly than the first requestor.

Now a heavily used file may end up staying in the cache indefinitely on a server with plenty of memory.

3) Question: Any difference in icon and folder caching?

Answer: There are no significant difference that we are aware of. The data elements are smaller than for regular stored data. This means you can keep more of them in a block.

DECK II and Power Macintosh 7xxx computers (5/96)

Revised: 5/21/96
Security: Everyone

DECK II and Power Macintosh 7xxx computers (5/96)

=====

Article Created: 21 May 1996

TOPIC -----

This article describes an issue with the applicatin DECK II by Macromedia on some Power Macintosh 7xxx computers.

DISCUSSION -----

Macromedia has confirmed a problem with DECK II, a digital multi-track audio recording application, on some Power Macintosh 7200, 7500, and possibly 7600 computers.

The symptom is after recording a sound the audio tracks will not be in synchronizion. The audio tracks can be shifted manually to put them back in synchronization.

The issue occurs with any version of DECK II up to version 2.5.1. It occurs with either the 1/8" sound input jack or the RCA input jack. They have confirmed some Power Macintosh 7xxx computers do not exhibit this symptom.

Macromedia is investigating this problem and plans to have a resolution in a future software update of DECK II.

Energy Saver: Empty Folders After Shutdown (5/96)

Revised: 5/22/96
Security: Everyone

Energy Saver: Empty Folders After Shutdown (5/96)

=====

Article Created: 21 May 1996

TOPIC -----

I have a Power Macintosh 9500/120 running System 7.5.3. I frequently let the computer shut itself down using the Energy Saver control panel. When I restart, I have an empty folder on my hard disk that is named with the date and time of the shutdown. Is there something wrong?

DISCUSSION -----

There is nothing wrong with your computer. The Energy Saver control panel that comes installed on your computer contains a feature named "Document Auto-Save". The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application.

The computer saves these documents in the folder named with the date and time. In your case, the computer appears to be shutting down while no applications are running, so no documents are saved.

PowerBook Duo: Removing When Stuck In A Duo Dock (1/97)

Revised: 1/24/97
Security: Everyone

PowerBook Duo: Removing When Stuck In A Duo Dock (1/97)

Article Created: 14 May 1996
Article Reviewed/Updated: 24 January 1997

TOPIC -----

I have a PowerBook Duo that is stuck in its Duo Dock. It will not eject. I need to get it out. Is there a way to separate it from the Dock without breaking it?

DISCUSSION -----

There are a couple of different steps you should take to determine why a PowerBook Duo will not eject from a Duo Dock.

Step 1

Verify that the Duo Dock is plugged into a known working outlet and has power. Without power, the eject button will not work. If the DuoDock is making a clicking sound the power supply may failing. A failed power supply disables the electrical eject mechanism.

Step 2

Check the position of the lock on the left side of the unit. All Apple Duo Docks have a locking mechanism to deter theft. The lock should in the open position (turned towards the "open lock" icon). If the Duo Dock is locked, neither the electric nor manual eject buttons will eject the Duo.

Step 3

Verify that a monitor or other heavy object has not been placed on top cover of the dock. In some cases, heavy monitors can cause the upper case lid to bow, pinching the Duo inside the dock.

Step 4

You can manually eject the Duo from the Dock much like you can manually eject a

floppy disk. Take a key and insert it into the manual eject slot, located half-way back on the left side of the Dock. Push the key into the slot. This will disengage the Duo Dock locking mechanism. When the locking mechanism is released the Duo may need to be wiggled or nudged from side to side. Or you might try to gently push it further into the dock while holding the key which should release it.

Step 5

If the above steps fail take the unit to your Local Service Provider to have the Duo removed.

Color OneScanner 600/27: Dispatcher Isn't Releasing RAM (5/96)

Revised: 5/21/96
Security: Everyone

Color OneScanner 600/27: Dispatcher Isn't Releasing RAM (5/96)

Article Created: 21 May 1996

TOPIC -----

I am using an Apple ColorOne 600/27 Scanner and the Dispatcher software. After scanning a document with Dispatcher, then closing the application, Photoshop will not open because of an Out of Memory error. I checked "About this Macintosh" and there is 10 MB of RAM missing. This is the amount allocated to Dispatcher. I had 55 MB of RAM allocated to Photoshop, and when I reduce the amount of memory Photoshop uses, it opens properly. I can also restart my Macintosh and then open Photoshop without changing the amount of RAM allocated to Photoshop.

DISCUSSION -----

We believe you encountered a ColorSync 2.0.1 problem that should be addressed in a future release of ColorSync. What is likely happening is a ColorSync PPC library code fragment is not getting unloaded. Although the memory fragment is small in size, if it is the middle of a large contiguous block of memory, then the "Largest Unused Block" of memory is reduced proportionately.

As you have discovered, the workaround is to quit the application then restart your Macintosh computer. To minimize the problem, minimize the launching. You should also quit the Dispatcher software before launching and working with your other applications that require a lot of RAM.

AppleShare 4.2.1: More Memory for File Server Program (5/96)

Revised: 5/22/96
Security: Everyone

AppleShare 4.2.1: More Memory for File Server Program (5/96)

=====

Article Created: 21 May 1996

TOPIC -----

Does AppleShare 4.2.1 perform better if additional memory is allocated to the AppleShare File Server application?

DISCUSSION -----

No, with AppleShare 4.2.1 the AppleShare File Server application that you see in the Apple menu is really a facade application, and it does not really do the work of file sharing. The suggested memory allocation of 200K is all that is needed. There is no practical benefit from expanding the amount of memory for the application partition.

The file server program (strictly speaking, the File Server Extension) is an extension, and giving it more memory is not a finder operation. For more information on AppleShare File Server memory and cache, search for Technical Information Library article, "AppleShare 4.2.x: File Server Memory & Cache Usage."

Hebrew/Arabic LK Custom Remove Won't Reset Text Settings (5/96)

Revised: 5/21/96
Security: Everyone

Hebrew/Arabic LK Custom Remove Won't Reset Text Settings (5/96)

=====

Article Created: 21 May 1996

TOPIC -----

The Custom Remove feature of the Hebrew or Arabic Language Kit Installer does not reset the Text control panel settings, if the System Direction is had previously been set at 'Right to left' and the cursor appearance is set to "split".

DISCUSSION -----

We tested the issue you describe by installing the Hebrew Language Kit, setting the control panel settings as you described, and then installing the Cyrillic Language Kit.

Steps To Reproduce

Step 1

Install Hebrew Language Kit.

Step 2

After restart, set System Direction to 'Right to left'.

Step 3

Set the cursor Appearance to 'split'.

Step 4

Remove Hebrew LK using the Installer.

Step 5

After restart, install the Cyrillic Language Kit.

The System Direction is still "Right to Left" and the cursor appearance is still "split". The Cyrillic Language Kit alone does not offer a way to reset these options.

Workaround

The workaround to this problem is to reinstall the Hebrew or Arabic Language Kit, and manually reset the System Direction and Cursor Appearance before custom removing it. Apple engineers are aware of this issue and are working to resolve it.

LaserWriter 16/600 PS: Font & Paper Tray PCL Commands (5/96)

Revised: 5/22/96
Security: Everyone

LaserWriter 16/600 PS: Font & Paper Tray PCL Commands (5/96)

Article Created: 22 May 1996

TOPIC -----

What are the commands to change character pitch, font, and the paper tray on the LaserWriter 16/600 PS using the TCP/IP UNIX environment?

DISCUSSION -----

The commands for changing the character pitch, font, and paper tray are HP PCL commands that need to be embedded in the text document from the UNIX workstation. The following PostScript code when downloaded to the LaserWriter 16/600 PS or LaserWriter Select 360 prints out a few pages of examples that provide the HP PCL escape sequences to obtain those samples:

```
%=====
% Begin PostScript code
%
/LaserJetIII /ProcSet findresource
/FontReport get exec
%
% End PostScript code
%=====
```

Note:

Prior to downloading the HP PCL escape sequences, if the printer's interface (parallel, serial, or Ethernet) is set for PostScript then it must be put into PCL5 emulation by including the following PostScript at the beginning of the print job:

```
%=====
% Begin PostScript code
%
currentfile /LaserJetIII statusdict /emulate get exec
%
% End PostScript code
```

%=====

As provided in the example pages that will be printed, the font and pitch selections are changed with the following escape sequences:

Note:

<esc> is the escape character in all of the following sequences.

Begin_Table

PCL Commands		What the PCL Command Does
<esc>(s#T		typeface selection (# corresponds to 1 of 4 typefaces available)
<esc>(slP		proportional spacing ON (Must be enabled for certain typefaces to be printed)
<esc>(s#H		pitch selection (# is usually 10 or 16.66 which is built-in)
		For paper tray selection
<esc>&l#h		to select a specific tray (l = lowercase L, and # corresponds to a number below)
		0 - source current (default)
		1 - upper tray
		2 - manual feed
		3 - manual feed envelope
		4 - lower tray
		5 - middle tray
		6 - envelope feeder

End_Table

Mac OS and the Year 2000 (6/96)

Revised: 1/20/97
Security: Everyone

Mac OS and the Year 2000 (6/96)

Article Created: 22 May 1996
Article Reviewed/Updated: 20 January 1997

TOPIC -----

You may have wondered whether the clock in your Macintosh computer will continue to function into the next (twenty-first) century. Many stories have been circulated about computers not being able to handle dates past a certain year.

This article contains some questions and answers dealing with the Macintosh computer, Power Macintosh computer, and Mac OS and what will happen in the year 2000 and beyond.

- 1) Will the Mac OS have a problem with dates in the year 2000?
- 2) Why can I not set the date in the Date & Time control panel past the year 2019?
- 3) Is the year 2000 a leap year?
- 4) Will my Apple PC or DOS compatibility card be able to handle the year 2000?

DISCUSSION -----

- 1) Question: Will the Mac OS have a problem with the year 2000?

Answer: No. The Mac OS has always correctly handled dates between January 1, 1904 and February 6, 2040. The current Mac OS date and time utilities handle all dates between 30,081 B.C. and 29,940 A.D. All applications and system software which use the supplied Mac OS date and time utilities will have no problems with the year 2000. The only possible issues would come if an application does not use the routines supplied by the Mac OS for manipulating dates and times. If you believe you have such an application, please contact the manufacturer of that application for an update.

- 2) Question: Why can I not set the date in the Date & Time control panel past the year 2019?

Answer: The Date & Time control panel constrains the year to the range 1920 to 2019. This was done because the original Macintosh System 6 General control panel only displayed a 2-digit year. A programmer can set the date beyond 2019 by calling a Mac OS supplied routine. Apple expects to release a revised Date & Time control panel as part of Mac OS 8.

3) Question: Is the year 2000 a leap year?

Answer: The rule for leap years is that all years divisible by 4 are leap years, except those years divisible by 100. The exception is that years divisible by 400 are leap years. This means that 1800 and 1900 were not leap years, but the year 2000 is a leap year.

4) Question: Will my Apple PC or DOS compatibility card be able to handle the year 2000?

Answer: DOS supports years 1980 through 2099. Follow these steps to set the date:

DOS

From DOS, use the date command the DATE command.

Format the date as: mm-dd-yy for years 1980 - 1999, or mm-dd-yyyy for 1980-2099.

Windows 3.x

For Windows 3.x use the Date & Time Control Panel found in the Main Program group, Control Panel icon. Click the numbers and change with the arrows. Note the four digit year format can be selected in the International Control Panel.

Windows 95

For Windows 95 go to Start Menu, Settings, Control Panel, Date/Time and set the date and time there also by selecting the value and changing with arrows.

Newer applications should also not have a problem with full year dates (2xxx), check with the vendor or test the application.

Article Change History:

20 Jan 1997 - Added info about DOS card & combined with another article.

03 Jun 1996 - Made corrections for technical accuracy.

30 May 1996 - Added information on the Date & Time control panel.

HyperCard: Problem with Type 3 Error Opening Power Tools (5/96)

=====

Article Created: 24 May 1996

TOPIC -----

This article describes type 3 errors when opening the Power Tools stack installed with the MultiMedia Learning Tools Bundle.

When I open the Power Tools HyperCard stack I get a type 3 error. Is there a problem with the stack?

DISCUSSION -----

The Power Tools stack in this bundle has an issue with the GeneralPalette XCMD. The resolution is to replace the Power Tools stack. The latest Power Tools stack is available from the online Apple Software Updates locations in the updated HyperCard 2.3.5 Stacks. A Power Tools stack from HyperCard 2.3.x can also be used.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Adobe Acrobat and Multiple Master Fonts (5/96)

Revised: 5/23/96
Security: Everyone

Adobe Acrobat and Multiple Master Fonts (5/96)

=====

Article Created: 22 May 1996

TOPIC -----

In the Fonts folder of my PowerBook 5300cs computer I have Adobe Sans MM and Adobe Serif MM. Why do they not show up in the fonts menu of my word processor?

DISCUSSION -----

Adobe Acrobat is bundled with some of the new Apple Macintosh computers. It installs the substitution fonts Adobe Sans MM and Adobe Serif MM for rendering the fonts to create Portable Document Format (PDF) files. These fonts are called Multiple Master Fonts (MMF) and are not the standard type fonts that would show up in the fonts menu.

Multiple Master Fonts is a font technology that lets you create thousands of font instances, the way the character looks, from a single typeface. Multiple Master Fonts design includes one or more design axis; including weight, width, style, and optical size. This provides solutions to common but hard-to-fix page composition problems such as copy fitting that otherwise cannot be solved without artificially squeezing, stretching, or compromising the type.

Power Macintosh: Teleport Flash Update Fails PCI-Based (5/96)

Revised: 5/23/96
Security: Everyone

Power Macintosh: Teleport Flash Update Fails PCI-Based (5/96)

=====

Article Created: 22 May 1996

TOPIC -----

I tried to run Teleport Flash Update on my 7500 Power Macintosh computer, but it keeps telling me it "won't run on this Macintosh." Why does it run OK on my Quadra 800?

DISCUSSION -----

Description Of Issue

When attempting to run the flash updater for the TelePort Platinum on a Power Macintosh 7200, 7500, 8500, or 9500 series computer an error indicating the "Flasher will not run on this Macintosh" appears. The GlobalFax software version affected is 2.5.3 or higher.

Solution

- This issue has been fixed with firmware version 1.401 now available on all electronic forums.
- Customers must flash the TelePort Platinum modem on all non-PCI-based Macintosh computers.

Affected Products

The Global Village Teleport Platinum is the only modem affected by this issue. No other Global Village modem products (PowerPort 1xx, PowerPort 5xx/Duo, GlobalFax only, OneWorld) are affected.

Only Use Updater On External Modems

The most recent flash update for TelePort modems (1.401) was designed for use ONLY with external TelePort serial modems. Customers who attempt to run the TelePort flash updater 1.401 on their bundled internal TelePort PlatinumV (on

Macintosh Performa computers) will get an error message, and the Flasher application will not run at all.

Article Change History:

23 May 1996 - Added info about only using on an external modem.

MAE 2.0: Cause of Segmentation Fault at Startup (5/96)

Revised: 6/4/96
Security: Everyone

MAE 2.0: Cause of Segmentation Fault at Startup (5/96)

=====

Article Created: 22 May 1996

TOPIC -----

MAE will fail to start, and an error in the shell that MAE starts from will contain one of these messages:

SOLARIS:
Segmentation fault, core dump.

HP-UX:
pid <number> rec'd a sigsegv for stack growth failure possibly causes:
insufficient memory or swap space or stack size exceeded maxssize. Segment
fault, core dump.

What is the cause and solution of the segment fault?

DISCUSSION -----

The first thing to check is that the user has the latest version of MAE (Currently 2.0.2). If the problem persists, it is due to the fact that the user has more than 591 characters in the PATH environment variable. The workaround at this time is the following:

Step 1

Start MAE up with the full path.
An example would be '/opt/apple/bin/mae'. This will allow MAE to startup without referring to the PATH environment variable.

Step 2

Reduce the PATH to less than 591 characters.

Article Created: 24 May 1996

TOPIC -----

I connected my Apple Multiple Scan 14 inch monitor to my PowerBook 5300c and my external monitor is not displaying an image. I have checked the cables and the same monitor and cable work fine with a desktop computer. The PowerBook has no problem with an external Apple 13 inch Color Display. Can you help?

DISCUSSION -----

This may be a timing issue. Apple's Multiple Scan monitors, and some other monitors, are designed with an energy saving feature. When no video signal is being sent to the monitor from the computer, the monitor will go into sleep mode to conserve energy. The PowerBook computer is designed to check if an external monitor is attached during start up, if the computer does not see the monitor it will not send out video signals to save energy.

If you turn on the monitor and let it go into sleep mode and then turn on the PowerBook computer you will get no image on the external display. Likewise, if you turn on the PowerBook first, then turn on the display after the PowerBook has already started up you will not get an image on the external monitor.

The proper way to power up is to turn on the monitor first and immediately turn on the PowerBook. The monitor will be on and awake when the PowerBook is starting up, so the PowerBook will recognize the monitor and send out video signals to the external monitor.

PacerTerm Print Issue to an Apple LaserWriter (5/96)

Revised: 5/23/96
Security: Everyone

PacerTerm Print Issue to an Apple LaserWriter (5/96)

=====

Article Created: 23 May 1996

TOPIC -----

Configuration: Macintosh running PacerTerm (3.10), DEC Mainframe (VT420 session). Printing to an Apple LaserWriter over the network.

Issue: When printing, the underlines come out as an Å. They are using the DEC Supplemental character set.

DISCUSSION -----

Getting underlines to print from the Macintosh VT terminal client (or any other VT terminal emulation client for that matter) is not trivial.

- Underlined text on the PacerTerm screen (or any VT terminal client) is created through standard VT escape sequences to start and stop underlining. In other words, when text is to be underlined, an escape sequence is sent by the host to start underlining, and another escape sequence is sent when underlining is to be turned off. These escape sequences are what is captured by PacerTerm in the session, so when the user selects print, these escape codes are in turn printed (this is most likely what the Å is).

- Printing underlines typically are handled easily by DEC line printers attached to the mainframe, or a terminal with a serial port. The DEC line printers are able to "interpret" the above mentioned escape sequences (or any other line drawing escape codes) and so can print underlines.

- PacerTerm supports serial printing via "AUX Printing" in the Terminal mode settings. You may be able to connect a DEC line printer to the Macintosh computer's serial port, though implementation could get quite messy. A program/driver would be needed to handle the printer session -- sending escape sequences to start and stop flow of the serial stream through the Macintosh computer's serial port.

- As a "shot in the dark," you may try to cut-and-paste the data to a Macintosh

word processor to see if the underlines come through.

The bottom line is that printing underlines is not possible from PacerTerm at this time. It's not an impossible feature to implement at the application level, but there would have to be some intelligence in the application to "note" which sections of text are underlined, and then integrate them with the calls made to the Mac OS Font Manager.

AIX: Logical Volume Manager Overview (5/96)

Revised: 5/31/96
Security: Everyone

AIX: Logical Volume Manager Overview (5/96)

=====

Article Created: 31 May 1996

TOPIC -----

This article contains an overview of the Logical Volume Manager in AIX.

DISCUSSION -----

Logical Volume Manager Overview

In a traditional UNIX environment, a hard drive is configured and formatted into distinct sections, called partitions or slices. A disk may be formatted to contain one or more of these partitions, each of which is empty and unassigned until used for a particular purpose. Most partitions later have some kind of file system created with them. These file systems can later be mounted somewhere under the root file system and accessed. Other partitions are deliberately left empty and used for system purposes, such as paging or swapping, or for specific applications such as Oracle, which use the empty space in an application specific way. Under this arrangement, a file can only be as large as the file system that contains it, which in turn can only be as large as the partition that contains it. The partition can never be larger than the single physical disk that contains it.

AIX has a way around these limitations. A traditional disk partition or slice in UNIX is replaced by something called a logical volume. The disk space that makes up a logical volume can span multiple disks, and be made up of blocks of non-contiguous space. Since a logical volume is not hard wired to a fixed amount of physical disk space, it can be dynamically enlarged without affecting the file system contained within it. That file system can then be enlarged later on to take advantage of the additional space added to the volume. Volumes can also be mirrored or striped for reliability or high speed access.

In AIX, an actual hard drive is known as a physical volume. Hard disks are grouped together to form volume groups. A volume group can contain one or more hard drives, and a hard drive can belong to only one volume group. The one thing all hard disks in a volume group have in common is, they all use the same size

unit of disk allocation space, which is called a physical partition. A physical partition can be anywhere from 1 to 256 MB in size. Physical partitions are the smallest units of space allocation on a physical disk. AIX comes with one default volume group, known as rootvg. All of the logical volumes necessary to boot and run the system are a part of rootvg. These volumes (and the file systems within them are):

Begin_Table

- /dev/hd4 '/' (root)
- /dev/hd2 /usr
- /dev/hd1 /home
- /dev/hd3 /tmp
- /dev/hd6 Paging space (not a file system)
- /dev/hd8 Journal File System log space (also not a file system)
- /dev/hd5 The boot logical volume (contains kernel, file system and other structures required to boot the system)
- /dev/hd9var /var

End_Table

A system can have many volume groups; all except for the rootvg are user defined and configured.

A logical partition is the same size as a physical partition; each one maps to an actual physical partition somewhere in the volume group. A logical volume consists of one or more logical partitions from within a volume group. Since logical volumes can be increased, it stands to reason that they can be expanded (the size of) one logical partition at a time. The default size of a logical partition in the rootvg (under Apple's version of AIX) is 16 MB. This logical storage method allows for a tremendous amount of storage capacity per system. The system limits are:

Begin_Table

- Volume groups 255
- Physical volumes 32 per volume group
- Physical partitions 1016 per physical volume, up to 256 MB each in size
- Logical volumes 256 per volume group
- Logical partitions 32,512 per logical volume

End_Table

Striping and Mirroring

One of the advantages to a logical storage management system is, striping and mirroring can be easily set up. Striping allows the data blocks that make up a file to be spread over two or more disks. The data blocks used in AIX striping are called stripe units; they can be 4K to 128K bytes in size. These stripe units (contained within logical partitions on different disks) allow parallel access to the data blocks of a file. This can greatly reduce file I/O access time.

Mirroring is when a logical partition maps to more than one physical partition with the same volume group (usually physical partitions on different physical volumes). All the logical partitions with a mirrored logical volume will be mapped to two, or possibly 3 different physical partitions. Mirroring can slow the performance of the logical volume, but it is very useful in cases where data redundancy and availability are critical.

System 7.5 Update 2.0 and CalComp (5/96)

Revised: 5/23/96
Security: Everyone

System 7.5 Update 2.0 and CalComp (5/96)

=====

Article Created: 23 May 1996

TOPIC -----

I installed System 7.5 Update 2.0, and now I have a conflict with CalComp's Drawing slate control panel version 1.9a. It crashes on startup or if the control panel is double-clicked.

DISCUSSION -----

CalComp Technical Support states version 1.9a of their software will work with System 7.5.3 if the CalComp software is reinstalled after upgrading to 7.5.3.

However, CalComp Technical Support recommends upgrading to version 2.0. It is available on their ftp site,

<ftp.calcomp.com>

or on their BBS, 714-236-3045.

On both locations, the file name is "adb20a.sea".

Startup Disk Control Panel and Quadra 840AV (5/96)

Revised: 5/23/96
Security: Everyone

Startup Disk Control Panel and Quadra 840AV (5/96)

=====

Article Created: 23 May 1996

TOPIC -----

I have a Quadra 840AV and I just installed System 7.5 Update 2.0. Now, every time I use the Startup Disk control panel to choose the internal hard disk as the startup disk, it will start up from the external disk. My friend has a Centris 660AV and it does the same thing. What's wrong?

DISCUSSION -----

The difficulty you are experiencing is caused by an incompatibility between the Startup Disk control panel version 7.5.2, which is part of System 7.5 Update 2.0, and Quadra and Centris 660AV and 840AV computers.

This control panel writes information to the parameter RAM (PRAM) to identify the hard disk from which the computer will start up. In this case, the information is not being stored properly.

Because the control panel setting is not working, the computer will simply use the SCSI device with the highest SCSI ID to start up. An external device will typically have a higher SCSI ID than your internal hard disk (the internal hard disk that shipped with your Macintosh computer has a SCSI ID of 0).

There are currently two ways to work around this. First, you can use an older version of the Startup Disk control panel. Startup Disk control panel version 7.3.2, which comes with System 7.5 or System 7.5.1, will work without complications.

Secondly, you can reset the PRAM to reset the default startup disk to your internal hard disk. To reset the PRAM, restart the computer and hold down the Command (Apple), Option, P, and R keys. Wait for the computer to make its startup chime twice. You may then release the keys. Be aware that resetting the PRAM will reset such settings as the sound volume and mouse speed to their default value, and will purge the contents of a RAM disk if you are using one.

Apple is working on a newer version of the Startup Disk control panel that will fix this problem. We hope to have this control panel included in a future system software update.

At Ease for Workgroups: After Deleting Preferences (5/96)

Revised: 5/29/96
Security: Everyone

At Ease for Workgroups: After Deleting Preferences (5/96)

=====

Article Created 23 May 1996

TOPIC -----

Occasionally, At Ease for Workgroups administrators delete the At Ease preferences because they have forgotten the passwords. This article provides answers to questions administrators may have after they have deleted the At Ease preferences.

DISCUSSION-----

WHAT HAS HAPPENED TO THE ADMINISTRATOR NAME?

Q: I threw away At Ease Preferences because I forgot the administrator's password. What is the Administrator name now?

A: If you restart after trashing the At Ease Preferences file, then there is no administrator name, and there is no password. When you launch At Ease Setup you will not be asked for a name or a password.

WHICH SECURITY MENU OPTION?

Q: There are two options in At Ease Setup under the Security menu, Administrator Setup and Change Password. Which one should I choose to reset the Administrator information?

A: You should choose Administrator Setup. Here are the steps to reset the Administrator information:

Step 1

From the Security Menu, choose Administrator Setup.

Step 2

Double-click on "At Ease Administrator" in the Administrator Setup window.

Step 3

Type the new password in the Password field.

Note: Do not press the enter or return key after entering the password the first time; if you do, At Ease displays this error message:

"You must enter the same new password in both fields."

Step 4

Press the Tab key and enter the new password again

Step 5

Type a clue, if desired

Step 6

Click on the OK button.

Step 7

If you want to change the administrator name, do so by typing a new name into the Administrator Name field.

WHAT IF I ELECT TO USE CHANGE PASSWORD?

Q: What happens if I choose Change Password from the Security menu?

A: Use this option if you simply want to enter the main administrator's password and clue, but you don't want to change the administrator's name. The administrator name will remain "At Ease Administrator."

Apple PCI Token Ring Card: Does Not Work With LLC 2 (5/96)

=====

Article Created: 24 May 1996

TOPIC -----

I cannot seem to get 802.2 Logical Link Control version 2 (LLC 2) support when using Apple's PCI Token Ring card. I am using Attachmate's IRMA for the Mainframe 4.0.5. Attachmate tells me that Apple's PCI Token Ring card does not support this protocol. I tried to use the MacMainframe software and the LLC 2 section is grayed out.

What is wrong? Does the Apple PCI Token Ring Card not support LLC 2?

DISCUSSION -----

No, Apple's PCI Token Ring card does NOT support LLC 2. Apple has no plans at this time to add support for LLC 2.

Pioneer 4400 Laserdisc Player & Power Macintosh 8500 (5/96)

Revised: 5/24/96
Security: Everyone

Pioneer 4400 Laserdisc Player & Power Macintosh 8500 (5/96)

Article Created: 24 May 1996

TOPIC -----

My Power Macintosh 8500 computer crashes when using a videodisc controller HyperCard stack, Macromedia Authorware, or Director-based application . This software does not crash Macintosh computers other than the 8500.

Has something changed in PCI-based computers with system software or the serial controller that would cause a HyperCard XCMD, which has worked with 680x0- and PowerPC NuBus-based computers, to crash the 8500?

System Information

Power Macintosh 8500
System 7.5.2
Open Transport 1.0.8
SerialDMA patch installed
Serial Port Arbitrator not present

Here are the details

This computer's hard disk has been formatted using Apple formatting utilities, and I've installed new system software. No other third-party software is present on the hard disk except for the HyperCard stack.

When stack is launched and "initialize laserdisc" response is 'yes', the system crashes.

I have analyzed the code, and the following section is the part that calls the resource (in the stack resource fork) called "controlVideo" from HyperCard v2.3. Once the call is executed, the system crashes. This spot is marked with "--->>", and I believe this is where the crash occurs. Do you concur?

Begin_Table

Start of HyperCard Script below line

```
-----  
on initializeThePlayer  
  global diskIsInitialized  
  
  show background button "Initializing--Please Wait"  
  
  put line 1 to 8 of the script of this stack into PLAYER_LIST  
  sort items of PLAYER_LIST  
  put ShowList(PLAYER_LIST,return,"Please Select Correct Model  
Player.",false,"Select,No Disc,Go Home")into RESP  
  if line 1 of RESP is "Select" then  
    put item 1 of line 2 of RESP into PLAYER_TYPE  
    if PLAYER_TYPE is "Pioneer 8000" then put "Pioneer 4200" into PLAYER_TYPE  
    setvideoplayer PLAYER_TYPE  
--->>    controlVideo init  
    put videoStatus() into areYouThere  
    if areYouThere = "noAnswer" then  
      answer "The Player Must be Connected and Turned On.  Please check."  
      put false into diskIsInitialized  
-----
```

End of HyperCard Script above line

End_Table

Can you please tell me what is wrong.

DISCUSSION -----

Apple has discovered an issue with the way the serial laserdisc driver XCMDs access Open Transport 1.0.8 in System Software 7.5.2 with SerialDMA 2.0.2.

Fortunately, System 7.5 Update 2.0 fixes this crashing problem. You may have to rewrite the XCMD to talk to Open Transport 1.1 correctly. Voyager Corporation has an XCMD that is reported to work with a Power Macintosh 8500.

Check the Player

In troubleshooting this problem further, we discovered that a Pioneer 4400 player put out 7.5 volts on the RXD line to the Power Macintosh 8500 instead of the 5 volts as it should. We inserted a 1K ohm resistor in the RXD line of the Pioneer CC-04 cable and that fixed this issue.

We called Pioneer and we were informed Pioneer was aware that certain Pioneer 4400 players put out too much voltage. This was fixed in a revision to the player after 1994. The player Pioneer player we investigated was manufactured in August of 1992, its serial number starting with MH390.

We then tested a Power Macintosh 8500 with System 7.5 Update 2.0 installed, used HyperCard 2.3.5 with Voyager's Videodisc Toolkit version 2.3, and everything worked fine.

AppleSearch 1.5 and Supported XTND Translators (5/96)

Revised: 5/25/96
Security: Everyone

AppleSearch 1.5 and Supported XTND Translators (5/96)

=====

Article Created: 25 May 1996

TOPIC -----

On my Apple Internet Server Solution (AISS) server, I'm getting Type 1 errors when trying to index four files created in Microsoft Word 6.0. When I have tried to index the files, my AppleSearch server hangs during indexing. What is wrong?

DISCUSSION -----

The AppleSearch server uses XTND translators to extract text from the files in its information sources. The following DataViz XTND translators are included with the AppleSearch product:

- MacWrite versions 4.5, 5.0, and II
- WordPerfect for Macintosh versions 1.0, 2.0, and 2.1
- Microsoft Word for Macintosh versions 3.0, 4.0, 5.0, and 5.1
- Microsoft Works (word processing) versions 2.0 and 3.0
- FrameMaker MIF versions 2.0 and 3.0
- PageMaker version 4.0
- Ragtime version 3.1
- AppleWorks
- WriteNow versions 2.0 and 3.0
- Nisus version 3.0
- PICT (text extraction only)
- Excel (tab text only, no formula)
- Microsoft Word for Windows versions 1.0 and 2.0
- WordPerfect for Windows version 5.1

If you try using later XTND translators, than what ship with AppleSearch, you may or may not have problems. Apple supports only those translators that ship with AppleSearch 1.5.

Troubleshooting A Hung CDE Interface (5/96)

Revised: 5/28/96
Security: Everyone

Troubleshooting A Hung CDE Interface (5/96)

=====

Article Created: 28 May 1996

TOPIC -----

This article describes some basic troubleshooting steps to follow when the Common Desktop Environment (CDE) you are using on your Network Server becomes hung up or frozen.

DISCUSSION -----

Overview

=====

There are times, especially when a Network Server is being set up, modified or configured, that the Common Desktop Environment (CDE) can get hung, or will slow down to the point where it is unusable.

Indications of this include:

- taking a very long time to log in or log off,
- applications not responding or not launching from the main panel,
- and dterm or smit sessions not starting.

Errors Caused by Changes to TCP/IP

Most of these symptoms are caused by changes, or errors in TCP/IP networking software, setup, or configuration. CDE is an X based application, and is particularly sensitive to changes or errors in the networking environment, including loss of network connection, an invalid or duplicate host name, setting up TCP/IP with the wrong network address, subnet mask, default router address, or incorrect DNS server. Any of these can keep CDE from starting, or, if the changes are made while CDE is running, can immediately "stall" the entire application.

These problems can be most easily avoided by making sure that all TCP/IP setup is correctly and permanently configured before starting CDE for the first time. Install_assist has numerous options for system configuration, including network

configuration. It is best to take the time and do all system configuration up front. If you have started using the system, choose "Command Line" or "Fail Safe" (a simple motif interface) login options rather than the default, which will launch CDE, until the system has reached it's final configuration and is stable. Remember, system configuration through smitty is always available in any environment.

If problems occur, the solution is to quit out of CDE, stop all networking services, correct the problem, and then restart networking, and finally CDE. If CDE is totally hung, it may still be possible to login over a serial terminal or through AppleTalk services. The following paragraphs describe various solutions, in increasing order of complexity.

Host Name Has Changed

=====

The simplest error to fix is that the host name has changed since the parent process of CDE (dtlogin) was started. The X variable, DISPLAY, will therefore be out of sync. Logging out of CDE, or killing the parent dtlogin, then restarting CDE, should be sufficient. (Lines starting with '#' are the actual commands to enter.)

Step 1

```
# ps -ef |grep dtlogin
```

```
root 2990 1 0 Apr 02  - 0.00  /usr/dt/bin/dtlogin -daemon
root 3516 2990 0 Apr 02  - 0.00  dtlogin <:0> -daemon
```

Step 2

```
# kill 2990
```

(Note that the dtlogin session killed is the one whose parent ID is '1', or init. Do not use a kill -9!)

Step 3

Repeat step 1 above, but grep for 'dtsession' instead of 'dtlogin'; kill it as in step 2, substituting the appropriate Process ID. (The process ID is the next numeric field following the name of the process owner.)

Then restart dtlogin and CDE:

```
# /etc/rc.dt
```

Solving More Serious Problems

=====

Step 1

Stop CDE, the parent dtlogin, and any remaining dtsessions as described above.

Step 2

```
# stopsrc -g nfs
(Stops nfs. Also stop other TCP/IP applications.)
```

Step 3

```
# ifconfig en0 down
(Brings down network interface.)
```

Step 4

```
# rmdev -l en0 -d
(Removes the network interface.)
```

If the entire CDE environment is potentially corrupted, you may need to do the following two steps. Otherwise, got to step 7.

Step 5

```
# mv /etc/dt /etc/dt.hold
(Removes all custom CDE components.)
```

Step 6

```
# mkdir /etc/dt
```

Step 7

At this point, using smit, completely reconfigure the networking interface and TCP/IP from the beginning. When you are done make sure that /etc/hosts and /etc/resolv.conf hold the correct information, and have no duplicate entries.

Step 8

Restart the system. This starts all networking daemons and X applications correctly. Before rebooting, you may also briefly test CDE by running /etc/rc.dt. (It is possible to just continue working after starting CDE, but the restart gives the best possible opportunity to start all networking services correctly.)

PowerBook Video Mirroring: Issues and Workarounds (5/96)

Revised: 5/29/96
Security: Everyone

PowerBook Video Mirroring: Issues and Workarounds (5/96)

=====

Article Created: 28 May 1996
Article Reviewed/Updated: 29 May 1996

TOPIC -----

This article describes all of the known issues with the video mirroring mode on PowerBook computer systems. Where possible, known workarounds have been provided.

DISCUSSION -----

What Is Video Mirroring And How Does It Work?

=====

Video mirroring is a feature provided on Macintosh PowerBook computers (it can also be used on some desktop Macintosh systems). If your PowerBook computer has an external monitor attached, you can use it to show the same images displayed on your built-in screen. This feature can be useful when you are making a presentation.

When an external monitor is connected to the PowerBook computer, video mirroring is by default "off" and the system is in normal "dual-screen" mode. To activate video mirroring, use the Video Mirroring Control Strip module or go to the PowerBook Display control panel.

When the PowerBook is in video mirroring mode, everything displayed on the primary device (usually the internal display) is then drawn again on the external device using the CopyBits routine (from the QuickDraw toolbox). The CopyBits routine copies a bitmap image from one region to another. If the two display devices are at different bit depths, then the image may have to be scaled down or dithered during the CopyBits process.

Video Mirroring Issues And Workarounds

=====

QuickTime Movies Are Slow And "Jerky"

When the PowerBook computer is in video mirroring mode, one video controller is having to draw everything twice. Because of this, QuickTime movies will not play back at the same frame rate as they will in a normal video mode.

To optimize QuickTime playback performance in video mirroring mode,

- set the color bit depth to 256 colors on both monitors
- keep the movie window size as small as possible
- turn off virtual memory

Issues With Presentation Applications

Slide presentation applications, such as Powerpoint and Persuasion, that make use of "fade and dissolve" type transitions may perform more slowly when in video mirroring mode. The same issues that cause QuickTime movie playback to be slow (see above) will also cause complex transition effects in slide presentation programs to be slow. With complex transitions, the amount of information for CopyBits to process increases dramatically, potentially causing a performance decrease. Simpler transition effects will cause less of a burden on the system.

Optimum performance can be achieved by using some of the following suggestions in the creation and delivery of the presentations:

- keep color settings to the minimum bit depth actually needed
- set both monitors to the same bit depth
- reduce use of animation transition effects to a minimum
- minimize use of complicated graphics
- minimize number of individual graphics per slide
- turn off virtual memory during presentations
- disable extensions that are not required during the presentation

Graphics Anomalies May Occur On A Mirrored Display

It is up to the application software to deal with multiple displays correctly. Some third-party software applications assume that displays can't overlap, and therefore don't make appropriate changes to all of the devices listed in the device list provided by toolbox routines such as GetDeviceList and GetNextDevice. This can result in screen regions getting updated on one display but not on the other when in video mirroring mode.

Although there is no Apple workaround for this type of problem (the third-party developer should address this in their software), you can usually choose which display will have the anomalies by making a particular display the "main" monitor. To do this, drag the menu bar onto the desired monitor icon in the Monitors control panel before activating video-mirroring mode. You may also need to drag the Happy Mac icon onto the desired monitor. To see the Happy Mac icon, hold down the Option key while the Monitors control panel is open. The anomalies will usually show up on the monitor that is NOT the "main" monitor. Also, setting both monitors to the same bit depth will reduce the chances of this happening.

Some applications, especially games, will draw directly to the screen instead of using Apple's QuickDraw routines to draw as normal. Drawing directly to the screen can be advantageous because it allows for faster speed and more direct control of timing. However, video mirroring mode exclusively uses QuickDraw routines to draw screen images twice. If a program is using non-QuickDraw routines to draw graphics, those graphics will appear corrupted on the device that is NOT selected as the "main" device in the Monitors control panel (discussed above) when video mirroring is active.

Most games will provide an option to turn QuickDraw graphics on or off instead of forcing the user to use non-QuickDraw graphics. Look in the Preferences section of the game for this setting.

Mouse Tracks with PowerBook 5300 & 190 Series

On PowerBook 5300 and 190 series computers, when in video mirroring mode, Mouse Tracks will only work on the internal PowerBook display. This is a current limitation of the PowerBook 5300 and 190 series computers. When in "dual-screen" mode, the cursor may leave cursor trails on the external monitor when Mouse Tracks is on. Until this is fixed, we recommend that you leave Mouse Tracks off when an external monitor is connected.

Apple IP Gateway 1.0.1: Read Me (12/96)

Revised: 12/11/96
Security: Everyone

Apple IP Gateway 1.0.1: Read Me (12/96)

=====

Article Created: 28 May 1996
Article Reviewed/Updated: 11 December 1996

TOPIC -----

This article is the Apple IP Gateway 1.0.1 ReadMe file.

DISCUSSION -----

This document provides late-breaking information not covered in the "Apple IP Administrator's Guide." It's a good idea to print this document and keep it with the guide.

This Read Me contains the following sections:

- INSTALLING THE GATEWAY ON NON-U.S. SYSTEMS
- USING MANUAL MACTCP ADDRESSES WITH APPLE REMOTE ACCESS CLIENTS
- TROUBLESHOOTING NETWORK ERRORS ON THE GATEWAY
- SETTING UP MULTIPLE GATEWAYS IN THE SAME ZONE
- TUNING THE APPLE IP GATEWAY
- LOCATING THE SNMP MIB FOR THE APPLE IP GATEWAY
- INSTALLING APPLE IP GATEWAY ON APPLESHARE 4.0
- INSTALLING APPLE IP GATEWAY ON OPEN TRANSPORT
- BUG FIXES/CHANGES IN THIS RELEASE

INSTALLING THE GATEWAY ON NON-ENGLISH LANGUAGE SYSTEMS

If you are installing the Apple IP Gateway on a non-English language Mac OS computer, you should run the Network Software Installer before proceeding with the rest of the installation process. See the section "International Users" in Chapter 2 of the "Apple IP Gateway Administrator's Guide" for details.

Apple recommends that you use Easy Install to install the gateway software on a non-English language Mac OS computer. If you use Custom Install, a message appears to warn you that continuing the installation replaces local-language versions of some AppleTalk system files (such as the Network control panel, AppleTalk, and EtherTalk) with English-language versions. If you click Continue,

the installation will replace all files with the same names as the files being installed. Thus, there may be two different versions of some AppleTalk system files on the startup disk—a local-language version and an English version. If you click Cancel, a message informs you that an error has occurred during installation, and the software on the startup disk was not changed.

USING MANUAL MACTCP ADDRESSES WITH APPLE REMOTE ACCESS CLIENTS

If an Apple Remote Access (ARA) client is using a manual (static) IP address, the ARA connection must be established before MacTCP is opened in order for TCP/IP application programs to work over the remote link. To ensure that MacTCP is not opened before the ARA connection, INITs that open MacTCP at startup of the Macintosh (such as SNMP TCP/IP Transport) should be removed from the user's system folder. Users who require such INITs must configure MacTCP to acquire an automatic (dynamic) IP address.

TROUBLESHOOTING NETWORK ERRORS ON THE GATEWAY

Network errors in the Gateway Information window (see the section "Monitoring the Gateway" in Chapter 3 of the "Apple IP Gateway Administrator's Guide" for details), may indicate that the domain name server (DNS) information is misconfigured on either the gateway machine or on client machines. If the gateway cannot find a DNS server, whether because the address is misconfigured or the server is unavailable, the gateway counts those failed attempts as network errors. If you do not have a DNS server, leave the DNS information blank in the MacTCP Administration window.

SETTING UP MULTIPLE GATEWAYS IN THE SAME ZONE

You can set up multiple Apple IP Gateways in the same AppleTalk zone. Doing so allows you to balance the gateway service load between multiple machines, as well as to provide service to an additional 253 users per gateway.

To set up multiple gateways, you must configure the gateway to provide automatic addresses only; you cannot use manual addresses with multiple gateways. Also, Power Macintosh clients will not be able to locate a gateway if there are multiple gateways in a zone. Only MacTCP clients on non-Power Macintosh machines will be able to locate a gateway if multiple gateways are in use.

Follow these steps to set up multiple gateways in the same zone:

- 1) Purchase another copy of the Apple IP Gateway and install it on another machine.
- 2) Set up the second gateway machine in the same zone as the original gateway.
- 3) Divide the automatic address range of the original gateway into two ranges. Configure the original gateway with one of these ranges and the second gateway with the remaining range.
- 4) Start both gateways.

Clients connect to the first gateway that responds. When a gateway has no more addresses to give out, it ceases responding, thus allowing another gateway to

respond to the client.

IMPORTANT: If you have Power Macintosh clients that need to access a gateway, do not set up multiple gateways in the same zone.

TUNING THE APPLE IP GATEWAY

If you are an experienced network administrator and would like to modify the gateway's internal parameters to suit your particular networking environment, you can obtain an Apple Business Systems (ABS) Technical Note that describes which parameters you can modify through use of a Macintosh software resource editor such as ResEdit. The document, entitled "IPGateway01 Tuning the Apple IP Gateway," is available through the following electronic sources:

- FTP: anonymous ftp to abs.apple.com, directory ~ftp/abs/
- AppleLink: through the path, Support/Developer Support/Developer Services/Technical Documentation/ABS Technical Notes
- Developer CD: Technical Documentation/ABS Technical Notes (on the reference library disk)

LOCATING THE SNMP MIB FOR THE APPLE IP GATEWAY

The gateway supports the SNMP MIB entitled "MacIP Management Information Base," which is available in the appendix of the "Apple IP Gateway Administrator's Guide" or electronically (in text form) on the "Apple IP Gateway Installer" disk 2, Network Management folder.

INSTALLING APPLE IP GATEWAY ON APPLESHARE 4.0

Apple IP Gateway installs Apple Shared Library Manager 2.0, which is not compatible with AppleShare 4.0. If you intend to run Apple IP Gateway and AppleShare 4.0 on the same Macintosh, upgrade to AppleShare 4.0.2 before installing the Apple IP Gateway.

INSTALLING APPLE IP GATEWAY ON OPEN TRANSPORT

Apple IP Gateway cannot be installed on a machine running Open Transport.

BUG FIXES/CHANGES IN THIS RELEASE

- Two clients connected to the same IP Gateway can talk to each other.
- The IP Gateway now works with external SCSI Ethernet devices.
- The Gateway does not allow the user to enter overlapping Static and Dynamic address ranges.
- The Gateway detects when a client with a static IP address changes its AppleTalk address as may occur when the client restarts.
- The Gateway Manager displays Macintosh names and AppleTalk addresses sorted in the correct order.
- A problem with Balloon help was fixed.

Substitution Fonts For Acrobat Or Adobe Type Manager (5/96)

Revised: 5/28/96
Security: Everyone

Substitution Fonts For Acrobat Or Adobe Type Manager (5/96)

=====

Article Created: 28 May 1996

TOPIC -----

I just installed Quick Draw GX on my PowerBook 5300 and now when I start up I get a message that says "The Substitution fonts necessary for Acrobat or Super Adobe Type Manager are missing. Please reinstall either software package". What does this mean and what should I do to correct the problem?

DISCUSSION -----

You need to run the Acrobat installer. It is located on the Hard Disk in the following location: Applications *f* -> Adobe Acrobat Reader 2.0.*f*. The icon labeled AcroRead.Mac is an installer. Double click it to install the required fonts. After the installation, restart the PowerBook and you will not get the error message any longer.

ColorSync 2.0.1: Version Information (5/96)

Revised: 5/28/96
Security: Everyone

ColorSync 2.0.1: Version Information (5/96)

=====

Article Created: 28 May 1996

TOPIC -----

What changes were made in ColorSync version 2.0.1?

DISCUSSION -----

The following changes were included in ColorSync version 2.0.1

Fixed several minor bugs relating to color conversion

- The default CMM did not produce correct results in the case of setting up a matching session with 3 or more profiles with absolute rendering intent.
- Default CMM did not handle bitmaps/pixmaps with rowbytes larger than 200K bytes per scan line correctly.
- With acceleration component installed, ColorSync did not switch among multiple active color worlds properly.
- Postscript related functions returned paramErr if a value other than 1 or 2 was passed to the "flag" field. Since the "flag" field is defined as "reserved", ColorSync will not check the value passed in that field in 2.0.1 release.
- CMXYZtoFixedXYZ color conversion function did not produce correct results.
- LabToXYZ color conversion returns wrong color when perform conversion in place.
- LuvToXYZ color conversion function did not clip underflow errors correctly.

Changed Files

The only changed file is the ColorSync system extension. The control panel,

profiles, and interface files are the same as 2.0 release.

New Files

AppleVision 1710 - 9300
Apple Multiple Scan 14
Apple Multiple Scan 1705
Apple Multiple Scan 15

ColorSync 2.0.1 is included in the following disk sets:

SW 1200 v 2.1.2
CSW 1500 v 2.2
CSW 2200 v 2.1.2
CSW 2400 v 2.1.2
CSW 2500 v 2.2.

Mac OS 7.5.3 Revision 2: Overview & Installation (8/96)

Revised: 10/14/96
Security: Everyone

Mac OS 7.5.3 Revision 2: Overview & Installation (8/96)

Article Created: 29 May 1996
Article Reviewed/Updated: 5 August 1996

TOPIC -----

This article is the Macintosh System 7.5.3 Revision 2 Overview and Installation file.

DISCUSSION -----

Who should install System 7.5.3 Revision 2?

Apple is recommending that only customers with specific system software and Macintosh computers update their systems with System 7.5.3 Revision 2. There is no benefit for other customers.

The only systems which will benefit from System 7.5.3 Revision 2 are as follows:

- All PowerBook systems using Connectix RAM Doubler
- All PowerBook 5300 and PowerBook Duo 2300 systems
- All PowerBook 200 or 500 Series systems which have been upgraded with the Macintosh PowerBook Processor Card Upgrade Kit with PowerPC (or upgraded with similar third party products).
- All Macintosh 7200, 7500, 7600, 8500, and 9500 systems

You should install System 7.5.3 Revision 2 only if you have a computer with System 7.5.3 installed or a PowerBook with System 7.5.2, PowerBook Enabler 1.2 or later installed. To find out what system software version your computer is using, follow these steps:

1. Make sure you are in the Finder.
2. Choose About This Macintosh from the Apple menu.
The system software information is in the About This Macintosh window.

What is System 7.5.3 Revision 2?

=====

System 7.5.3 Revision 2 is a set of system software enhancements that improves the reliability and performance for the computers described above.

When you install System 7.5.3 Revision 2, you get the following enhancements:

- Better reliability for PowerBooks using RAM Doubler
If you have a PowerBook using system software 7.5.3, and use RAM Doubler (version 1.6.1 or earlier), you may have experienced a problem when waking your PowerBook from sleep. This software fixes this problem.
- Overall performance enhancements for PowerBook 2300 computers and PowerBook 500 or Duo series computers with the PowerPC Upgrade Card installed.
- Improved reliability when using PC-formatted floppy disks with PowerBook 500 series or Duo series computers with the PowerPC Upgrade Card installed.
If you have a PowerBook 500 series or Duo series computer with the PowerPC Upgrade Card installed, PC-formatted floppy disks that were formatted on your computer may be unreadable in DOS or Windows computers. This software fixes this problem.
- Improved reliability on PCI-based computers (Macintosh 7200, 7500, 7600, 8500, and 9500 computers) and PowerBook 5300 computers, PowerBook 2300 computers, and PowerBook 500 or Duo series computers with the PowerPC Upgrade Card installed.
- Improved reliability when copying files to a 1 gigabyte hard disk.
If you have a PCI-based computer with a 1 gigabyte drive, this software helps avoid problems when copying files to the hard disk.
- Improved reliability when using the Startup Disk control panel.
In rare instances, when you turn on a PCI-based Power Macintosh computer it may not start up from the disk selected in the Startup Disk control panel. This software fixes this problem.

Before you Install

=====

Note that if you have an AppleVision monitor, you should install "AppleVision for System 7.5 Update 2.0 fix version 1.0" before you install this update.

When you install this software, an extension called Startup Tuner is installed in your Extensions folder. This extension ensures that your computer will correctly start up from the disk selected in the Startup Disk control panel.

It is recommended that you run the Disk First Aid application found on the "Disk Tools" disk that shipped with your computer. Double-click the Disk First Aid icon and follow the instructions on the screen. Disk First Aid checks your hard disk for problems. If you have a problem using Disk First Aid, see the manual

that came with your computer.

Installing System 7.5.3 Revision 2

=====

Before you install System 7.5.3 Revision 2, your computer should have System 7.5.3 installed or System 7.5.2, PowerBook Enabler 1.2 or later installed. To find out what system software version your computer is using, follow the steps in "Who should install System 7.5.3 Revision 2" above.

Follow these steps to install System 7.5.3 Revision 2:

1. Open the Extensions Manager control panel.
2. Choose either "System 7.5.3" or "System 7.5.2" from the Sets pop-up menu (one of these two choices will appear, depending on the version of system software your computer is using).
3. If you have third-party peripherals that are required for installation and that require an extension, turn those extensions back on. (Examples include video drivers, alternative input devices, network card drivers, and removable media.)
4. Restart your computer.
5. Insert the System 7.5.3 Revision 2-1 disk into the floppy disk drive, and double-click its icon to open it.
6. Double-click the Installer icon to open it.
7. After you read the licensing agreement, click Agree to continue with the installation.
8. Make sure that the destination disk indicated on the screen is the one on which you want to install system software. If the wrong disk name appears, click the Switch Disk button until the correct disk name appears.
9. Click Install.
10. Follow the instructions on the screen. On-screen messages tell you when you need to insert the other disk.
11. When the installation is complete, Click Restart to restart your computer.
12. Use the Extensions Manager to turn on additional extensions (you'll need to restart your computer for the extensions to work). If you encounter problems, choose the set of extensions you chose before the installation (see step 5), restart your computer, then turn on extensions one at a time to determine if one of them is incompatible.

Article Change History:

AISS and Drag Installation (5/96)

Revised: 5/29/96
Security: Everyone

AISS and Drag Installation (5/96)

=====

Article Created: 29 May 1996

TOPIC -----

I was installing the Apple Internet Server Solution (AISS) software with the AISS 2.0 CD this week, and found a minor problem. In the RealAudio Server 1.0 folder, there is a folder pointing to the RealAudio folder, requesting that it be put in the Preferences folder.

When I placed it there and attempted to start the management application, I got an error. What is wrong?

DISCUSSION -----

The RealAudio folder should be placed in the Extensions folder, rather than the Preferences folder. If you place the RealAudio folder there, RealAudio should work properly.

Also, if you use the installer instead of drag installing, you will not experience this issue. This is because the installer places the RealAudio folder (and other AISS software) in the correct location.

MacTCP -> Open Transport (7/96)

Revised: 7/3/96
Security: Everyone

MacTCP -> Open Transport (7/96)

=====
Article Created: 29 May 1996
Article Reviewed/Updated: 3 July 1996

TOPIC -----

I upgraded my non-PCI Macintosh with Open Transport. How do I configure the TCP/IP control panel so it uses my old configuration?

DISCUSSION -----

Open Transport is Apple's new networking architecture which provides support for AppleTalk and TCP/IP protocols. Users with other network protocol stacks should seek assistance from the software vendor.

AppleTalk

Open Transport replaces the Network control panel with the AppleTalk control panel.

1 - Set the "Connect via" menu in AppleTalk control panel to the network interface you used in the "Network" Control Panel.

Network ->	AppleTalk
-----	-----
LocalTalk	Printer port
EtherTalk	Ethernet
Remote Only	Remote Only

NOTE: Token Ring is currently unsupported. Since there are no PCI Token Ring cards, obviously there will be no selection.

NOTE: LocalTalk can be used with the modem port. Remember to move your connector to the modem port if you use this selection.

2 - Set "current zone" in AppleTalk control panel to "current zone" from "Network" Control Panel

3 - Close the control panel for changes to take effect.

In "AppleTalk" Control Panel provides additional features, please see your documentation for more information.

TCP/IP

Open Transport replaces the "MacTCP" control panel with "TCP/IP" control panel.

NOTE: Some installer will automatically configure Open Transport to your old MacTCP settings.

MacTCP supported many configuration methods. Depending on the method MacTCP used, use the following steps:

- MacTCP Interface = Localtalk, Ethertalk, Remote Only
Obtain address = server

1 - Set "Connect via" menu to "AppleTalk (MacIP)" in "TCP/IP" control panel.

2 - Set "Configure" menu to "Using MacIP Server"

3 - Set "MacIP server zone" to the zone selection from "MacTCP" control panel.

4- Close the "TCP/IP" control panel for changes to take effect.

- MacTCP Interface = Localtalk, Ethertalk, Remote Only
Obtain address = manually

1 - Set "Connect via" menu to "AppleTalk (MacIP)" in "TCP/IP" control panel.

2 - Set "Configure" menu to "Using MacIP Manually"

3 - Set "MacIP server zone" to the zone selection from "MacTCP" control panel.

4 - Copy "IP address" and "Subnet mask" from "MacTCP" control panel to "TCP/IP" control panel.

5 - Copy "Domain Name" from "Domain" that was selected as "Default" in "MacTCP" control panel.

6 - Copy "Router address" from "Gateway Address" in "MacTCP" control panel.

7- Copy "Name server addresses" from the "IP address" entries in "Domain Name Server Information.

8 - Close the "TCP/IP" control panel for changes to take effect.

- MacTCP Interface = Ethernet
Obtain address = manually

1 - Set "Connect via" menu to "Ethernet" in "TCP/IP" control panel.

2 - Set "Configure" menu to "Manually"

3 - Copy "IP address" and "Subnet mask" from "MacTCP" control panel to "TCP/IP" control panel.

4 - Copy "Domain Name" from "Domain" that was selected as "Default" in "MacTCP" control panel.

5 - Copy "Router address" from "Gateway Address" in "MacTCP" control panel.

6- Copy "Name server addresses" from the "IP address" entries in "Domain Name Server Information."

7 - Close the "TCP/IP" control panel for changes to take effect.

- MacTCP Interface = Ethernet
Obtain address = server

1 - Set "Connect via" menu to "Ethernet" in "TCP/IP" control panel.

2 - Set "Configure" menu to "Using BOOTP" or "Using RARP". You may need to ask your network administrator which network server is in use.

3- If you choose RARP, the server will provide only an IP address.

4- Close the "TCP/IP" control panel for changes to take effect.

Note: Obtain address "dynamically" is no longer supported in any fashion. Apple recommends the use of manual addressing, or adoption of a network configuration protocol such as RARP, BOOTP, or DHCP.

Note: TCP/IP also adds support for configuration via DHCP, a feature not offered in MacTCP.

Powerbook 2300: Dock Issue W/Third-Party Ethernet Cards (5/96)

Revised: 5/29/96
Security: Everyone

Powerbook 2300: Dock Issue W/Third-Party Ethernet Cards (5/96)

=====

Article Created: 29 May 1996

TOPIC -----

I just purchased a Macintosh Powerbook 2300 (Duo) series computer. When I put it in my Duo Dock Ethernet does not work. It works fine with my PowerBook Duo 230 computer. What could be wrong?

DISCUSSION -----

It is possible that some non-Apple (third-party) Ethernet NuBus cards installed in a Apple Duo Docking stations will not work with the PowerBook 2300 series computers even if they work with all other PowerBook Duo computers.

In contrast, the Apple Ethernet NB card (M0417LL/B) works with all models of PowerBook Duo computers including the 2300 series. It is possible that some third-party Ethernet board manufacturers may not have followed the Apple design specifications closely enough, resulting in some problems with the 2300 series.

If you have a non-Apple Ethernet card in your Duo Docking station that is not working with a PowerBook 2300 series computer, you should contact the vendor of that NuBus Ethernet board/card for more information concerning compatibility.

Power Macintosh and GeoPort Troubleshooting Steps (5/96)

Revised: 5/29/96
Security: Everyone

Power Macintosh and GeoPort Troubleshooting Steps (5/96)

Article Created: 29 May 1996

TOPIC -----

I just got my GeoPort Telecom Adapter version 2.x for my Power Macintosh computer and I cannot get it to work. What do I do?

DISCUSSION -----

Before you use an online service, terminal software, or Internet connection software make sure the modem software is working. As a test, send the "My First Fax" document to someone. If Faxing the document does not work, here are some troubleshooting steps you can use to get your GeoPort Telecom Adapter working:

Step 1

Make sure you have the correct version of the Apple Telecom software installed on your computer. Apple recommends Apple Telecom v2.3.2 or later, and this software can be found online at Apple Computer's software update locations.

Step 2

Check the physical connections of the GeoPort Telecom Adapter.

- The GeoPort Telecom Adapter should be connected to the computer's modem port.
- The telephone cable should be connected to the GeoPort Telecom Adapter's RJ11 jack with a telephone jack icon.
- Optional, a telephone can be connected to the GeoPort Telecom Adapter's RJ11 jack with a telephone icon.

Step 3

Make sure that your settings in the Express Modem control panel are set appropriately.

- Express Modem is turned on.
- Under advanced options set the progress sounds to keep on until carrier.

NOTE: This is for troubleshooting purposes only. It will leave the speaker on until the carrier is established. After you have verified that the modem is functioning, you may select another option more suitable to you.

Step 4

Delete the following preferences

- Express Modem Preferences
- Fax terminal Log
- Fax terminal prefs
- Fax viewer prefs
- Finder prefs
- GeoPort teltool prefs

Step 5

Clear the parameter ram.

- Turn machine off.
- Restart machine and hold down option-command-p-r keys.
- Keep keys held down until you hear at least two startup chimes.

Step 6

Make sure AppleTalk is set to inactive in the AppleTalk control panel on the PCI based Power Mac computer models (7200, 7500, 8500 or 9500).

Step 7

Turn on only the extensions needed to run the GeoPort and restart the machine

- Use the extensions manager to select the system set
- Turn on fax extension, fax sender, telephone manager, and express modem.

Step 8

Upon restarting your machine, make sure the GeoPort and Fax extensions load. During startup the fax extension appears as a fax with a piece of paper rolling out of it and the geoport extension is a telephone with buttons that will flash. If either of these do not appear, appear with an X over them, or are dark and do not show animation try turning on just the geoport extensions listed in step 6. If they continue to not load at startup, delete and reinstall the Apple Telecom software.

Step 9

Disconnect and reconnect the GeoPort Telecom Adapter from the back of the computer while it is turned on. This will reset the GeoPort.

Step 10

Delete and reinstall the Apple Telecom software.

Step 11

Try another phone jack. Make sure that it is an analog line as opposed to a digital line. Analog lines have been the standard for sometime in telephone or voice signal. However, digital lines are being installed for use as well.

Step 12

Clean install the system software and then install the Apple Telecom software.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Revised: 5/30/96
Security: Everyone

MacTest Pro for Power Macintosh Read Me (5/96)

=====

Article Created: 29 May 1996

TOPIC -----

This article is the MacTest Pro for Power Macintosh Read Me file.

DISCUSSION -----

The February 1996 Macintosh Family Diagnostics Update Mailing includes separate CD's, diskettes, and User's Guides for MacTest™ Pro for Power Macintosh, and for MacTest Pro for 680x0-based Macintosh computers.

The information in this READ ME file refers to MacTest Pro for Power Macintosh, and is effective as of 02/21/96. This file contains important information about the MacTest Pro for Power Macintosh application, its test modules, and the MTP Emergency (PPC) application. This information supersedes some sections of the MacTest Pro for Power Macintosh User's Guide (073-0414-A).

WHAT'S NEW

- MacTest Pro for Power Macintosh v1.0 and MTP Emergency (PPC) v1.0 are designed to launch only on Power Macintosh computers; these applications will not launch on 680x0-based Macintosh computers. Use the MacTest Pro v1.3 and MTP Emergency v1.1 applications to diagnose 680x0-based Macintosh computers.
- For Macintosh Quadra and Centris computers upgraded with the Power Macintosh Upgrade Card, and for Macintosh 630 series, LC 475, LC 575, and Quadra 605 computers upgraded with the Macintosh Processor Upgrade Card, use MacTest Pro v1.3 (for 680x0-based machines) with the Power Macintosh Upgrade Card Tests module, and use MTP Emergency v1.1.
- The new test modules which run only with MacTest Pro for Power Macintosh have the suffix "(PPC)" to distinguish them from the test modules which run only on 680x0-based Macintosh computers.

- A new test module, "Serial Loopback Tests (PPC)", replaces the functionality of the "Communication Ports Tests" in the previous version of MacTest Pro.
- The "DOS Compatible Card Tests" and the "MacTest Pro Help" modules have not yet been converted for MacTest Pro for Power Macintosh; the CPU-specific test modules which are 680x0-based will not be converted; there are no plans at this time to convert "Modem Tests"; the "Machine Checker " test module is undergoing major design changes for Power Macintosh, and is not yet available.
- The Display Service Utility v1.0 is included on the MacTest Pro for Power Macintosh CD and on the "MacTest Pro (App+Mods2 PPC)" disk.

BOOTABLE MACTEST PRO FOR POWER MACINTOSH CD

The MacTest Pro for Power Macintosh CD v1.0 is bootable on almost all Power Macintosh computers. Instructions for booting from the CD are included in the CD Guide booklet. Electronic copies of current documentation and the most recent System Software Enablers are provided on the CD.

Note that you may launch MacTest Pro for Power Macintosh, MTP Emergency (PPC), and the printer and display utilities from the CD whether or not you to boot from the CD. Refer to the electronic document "How to Use this CD" located on the CD for more information.

BOOTABLE DISKS

Two of the four disks in the MacTest Pro for Power Macintosh disk set are BOOTABLE emergency startup disks. Please review the information below and refer to the labels on the emergency disks to determine which disk to use for the machine you are testing. The MTP Emergency (PPC) application is the same on both of the bootable disks. Instructions for using the MTP Emergency (PPC) disks are included in the "Using the MTP Emergency (PPC) Disks" section of the MacTest Pro for Power Macintosh User's Guide.

- Use the "MTP Emergency (PCI PPC)" disk with the following computers: Power Macintosh 7200, 7500, 8500 and 9500 series, and PowerBook 5300 and 2300 series. This disk contains the MTP Emergency application, System 7.5.2, and required enablers.
- Use the "MTP Emergency (NuBus PPC)" disk with the following computers: Power Macintosh 6100 series, 7100 series, 8100 series, Performa 6100 series, Apple Workgroup Servers 6150, and 8150. This disk contains the MTP Emergency (PPC) application, System 7.5, and required enablers.

NOTE: The Apple Workgroup Server 9150 requires different system software than

what is provided on either of the MTP Emergency (PPC) disks. To create a bootable

emergency disk for this computer, please refer to the instructions included

in the

electronic document "How to Make Floppy Disks", which is located in the "Build Diskettes" folder on the MacTest Pro for Power Macintosh CD.

NOTE: For the Performa 6200 and 6300 series, and for the Power Macintosh 5200 and 5300 series, you must boot from the Apple Macintosh CD which came with

the computer. Then launch MTP Emergency (PPC) from the "MTP Emergency (NuBus PPC)" disk. (It is not possible to create a bootable MTP Emergency (PPC)

disk for these computers, due to the size of system software.)

NONBOOTABLE DISKS

Two of the four disks in the new MacTest Pro for Power Macintosh disk set are nonbootable: they do not contain System files.

- "MacTest Pro (App+Mods1 PPC)" contains the MacTest Pro for Power Macintosh application, the commonly used CPU and peripheral test modules, Hardware Info, Software Info, and the READ ME and VERSION INFO files.
- "MacTest Pro (App+Mods2 PPC)" contains the MacTest Pro for Power Macintosh application, tests for serial ports and cards, as well as printer and display utilities.

OPERATING TIPS - WORKAROUNDS - KNOWN BUGS

The "Operating Tips - Workarounds - Known Bugs" listed here are either new with this release or represent issues that all MacTest Pro for Power Macintosh users MUST be aware of. An electronic copy of the most recent User's Guide is included in the "Documentation" folder on the MacTest Pro for Power Macintosh CD.

... Display Service Utility ...

Display Service Utility is not a test module; it is a stand-alone application distributed with MacTest Pro for Power Macintosh as a convenience to service technicians. Refer to the Display Service Utility's own READ ME file for more information.

Because Display Service Utility's "settings restore" option creates a file to temporarily store settings, it cannot be run from the CD-ROM or other locked media. Move the Display Service Utility application to the hard drive or to an unlocked disk before using it.

... MacTest Pro for Power Macintosh ...

Although Power Macintosh computers with PCI expansion slots can support the

addition of NuBus cards via a third-party PCI-to-NuBus bridge product, MacTest Pro for Power Macintosh at this time does not support any NuBus cards installed in such a bridge. For example, the Hardware Info test module will not list these cards in the Expansion Slot Information.

Help text cannot be printed.

Printing with QuickDraw GX is currently not supported.

Test modules that turn off AppleTalk (see User's Guide for additional information) can interrupt some network services, such as the Apple Laserwriter Bridge. This results in an alert to the user, which must be dismissed by the user before testing will continue. This interruption can impact the looping of tests. Do not leave the machine unattended until at least one loop of testing has been completed.

... MTP Emergency (PPC) ...

Always connect SCSI hard drives to the standard SCSI connections provided by the Power Macintosh hardware before running diagnostic tests. If you run hard drive tests on drives connected to a 3rd party SCSI bus (i.e. expansion slot card), then MacTest Pro for Power Macintosh may hang, or may incorrectly report a hard drive failure. If you subsequently run a logic board test, it may incorrectly report a logic board failure. Do not reject a hard drive or logic board based on these false reports. Turn off the Power Macintosh, reconnect the SCSI hard drive to a standard SCSI connection and restart. Then launch MacTest Pro for Power Macintosh and start the tests again.

The CPU clock speed that is displayed in the Hardware Info Log and by MTP Emergency is an approximation based on information gathered from the system; the presence of accelerator cards may affect the accuracy of this information.

On some Workgroup Servers, the machine name may be reported as the Power Macintosh on which the Workgroup Server is based (or vice-versa) depending on the version of System software which is running. For example, a Workgroup Server 6150 may be incorrectly identified as a Power Macintosh 6100.

... Ethernet Card Tests (PPC) ...

The "Test Info" and the "Operation Info" in the MacTest Pro for Power Macintosh application state that you may run the Ethernet Card Tests (PPC) while the card is connected to a network. This is INCORRECT. Running the test while connected to a network may result in a crash or false failure of the test. To run the test correctly, disconnect the card from the network, and restart the Macintosh before launching MacTest Pro for Power Macintosh.

... Expansion Card Tests (PPC) ...

This first release of Expansion Card Tests (PPC) covers only NuBus cards; it does not yet cover the HPV video card in the PDS slot, nor does it cover any cards in PCI slots.

... Mass Storage Device Tests (PPC) ...

The Mass Storage Device Tests (PPC) module is designed to test all CD-ROM drives, hard drives and tape drives released by Apple, when installed with driver software by Apple. The test module will load and attempt to run on non-Apple devices (see below) and/or with non-Apple drivers (such as FWB CD-ROM Toolkit), however the Mass Storage Device Tests (PPC) module has not been tested with third-party CD-ROMs and drivers. Any results which may be obtained will not be reliable.

Mass Storage Device Tests (PPC) does not currently support CD-ROMs with blocksizes other than 2048 bytes, or hard drives with blocksizes other than 512 bytes (such as 4Gb drives which may have blocksizes larger than 512 bytes). Any results which may be obtained will not be reliable.

Mass Storage Device Tests (PPC) can test a PCMCIA card which is an IDE hard drive (except on PowerBook 500 series computers). The test module may load and attempt to test other PCMCIA devices (such as flash cards), however any test results which may be obtained will not be reliable.

When you are testing a DDS-DC tape drive, be sure to use a properly formatted known-good tape (for example, if you insert a 'Helical Scan' tape, the test will fail). Also, if the write protect switch on the tape is enabled, the test will fail.

Mass Storage Device Tests (PPC) can only test devices on the primary SCSI bus. To test devices which are connected to a secondary or tertiary SCSI bus, you must first disconnect the device, and reconnect it to the primary SCSI bus.

Before running the Hard Drive Seek Test option of the Mass Storage Device Tests (PPC) module on a Power Macintosh 7200, 7500, or 8500 series computer, you must set the Control Panel Energy Saver Sleep Setup settings to "Never". Otherwise, the test may hang or fail when the hard drive goes to sleep (spins down).

When running Mass Storage Device Tests (PPC), if the CD-ROM test disc was already inserted in the CD-ROM drive when a test failure is detected, the CD-ROM test disc may not eject from the CD-ROM drive. To eject the CD-ROM test disc, run the CD-ROM portion of the Mass Storage Device Tests (PPC) again, and then cancel the test after the CD-ROM test disc is ejected. Or, reboot the computer, and the CD-ROM test disc will be ejected automatically.

VERSION INFO -----

Information about the current versions of System Enablers, and MacTest Pro for Power Macintosh test modules can be found in the accompanying VERSION INFO file.

MacTest Pro 680x0-based Macintosh computers Read Me (5/96)

Revised: 5/30/96
Security: Everyone

MacTest Pro 680x0-based Macintosh computers Read Me (5/96)

=====

Article Created: 29 May 1996

TOPIC -----

This article is the MacTest Pro for 680x0-based Macintosh computers Read Me file.

DISCUSSION -----

The February 1996 Macintosh Family Diagnostics Update Mailing includes separate CD's, diskettes, and User's Guides for MacTest™ Pro for 680x0-based Macintosh computers, and for MacTest Pro for Power Macintosh.

The information in this READ ME file refers to MacTest Pro for 680x0-based Macintosh computers, and is effective as of 02/21/96. This file contains important information about the MacTest Pro application, its test modules, and the MTP Emergency application. This information supersedes some sections of the MacTest Pro User's Guide for 680x0-based Macintosh computers (073-0326-F).

WHAT'S NEW

- MacTest Pro v1.3 and MTP Emergency v1.1 are designed to launch only on 680x0-based Macintosh computers; these applications will not launch on Power Macintosh computers. Use the MacTest Pro for Power Macintosh and MTP Emergency (PPC) applications to diagnose Power Macintosh computers.
- For Macintosh Quadra and Centris computers upgraded with the Power Macintosh Upgrade Card, and for Macintosh 630 series, LC 475, LC 575, and Quadra 605 computers upgraded with the Macintosh Processor Upgrade Card, use MacTest Pro v1.3 (for 680x0-based machines) with the Power Macintosh Card Tests module, and use MTP Emergency v1.1.
- For 68000-based Macintosh computers (Macintosh Plus, SE, Classic, Portable, and PowerBook 100) only the MTP Emergency application is available. For 68020,

68030, 68040, and 68LC040-based computers, both MTP Emergency and the MacTest Pro application are available.

- The following test module updates include minor bug fixes and enhancements:

- Communication Ports Tests v1.3
 - Expansion Card Tests v3.0
 - File Checker v2.1.1
 - Hardware Info v1.9.7
 - Software Info v1.9.1

- The Display Service Utility v1.0 is now included on the MacTest Pro CD and on the "MacTest Pro (App+Mods Vol2)".

BOOTABLE MACTEST PRO CD

The MacTest Pro CD v5.0 is bootable on almost all 680x0-based Macintosh, PowerBook, and Performa computers. Instructions for booting from the CD are included in the CD Guide booklet. Electronic copies of current MacTest Pro documentation and the most recent System Software Enablers are provided on the MacTest Pro CD.

You may launch MacTest Pro, MTP Emergency, and the printer and display utilities from the CD whether or not you to boot from the CD. Please refer to the electronic document "How to Use this CD" located on the CD for more information.

BOOTABLE DISKS

Two of the four disks in the MacTest Pro (for 680x0-based Macintosh computers) disk set are BOOTABLE emergency startup disks. Between the two, these disks will boot all 680x0-based Macintosh computers except for the PowerBook 190 (see the User's Guide section "MTP Emergency - Creating Emergency Disks" for more information). The MTP Emergency application is the same on both of the bootable disks. Instructions for using the MTP Emergency disks are included in the "Using the MTP Emergency" section of the MacTest Pro User's Guide.

- Use the "MTP Emergency (680x0)" bootable 1.44MB disk with Motorola 680x0-based Macintosh computers which are equipped with a 1.44 MB floppy drive. This disk contains the MTP Emergency application and System 7.5.

- Use the "MTP Emergency (SSW 6.0.8)" bootable 800K disk for 680x0-based Macintosh computers which are equipped with only an 800K floppy drive. These include the Macintosh Plus, SE, SE/30, Macintosh II, IIx, and IIfx -- if the computer has never been upgraded to include a 1.44 MB floppy drive. This disk contains the MTP Emergency application, System 6.0.8, and Finder.

NONBOOTABLE DISKS

Two of the four disks in the MacTest Pro disk set are nonbootable; they do not contain System files.

- "MacTest Pro (App+Mods Vol1)" contains the MacTest Pro application, the commonly used CPU and peripheral test modules, Hardware Info, Software Info, and the READ ME and VERSION INFO files.
- "MacTest Pro (App+Mods Vol2)" contains the MacTest Pro application, tests for serial ports, modems and cards, and printer and display utilities.

OPERATING TIPS - WORKAROUNDS - KNOWN BUGS

The "Operating Tips - Workarounds - Known Bugs" listed here are either new with this release or represent issues that all MacTest Pro users MUST be aware of. An electronic copy of the most recent MacTest Pro User's Guide is included in the Documentation folder on the MacTest Pro CD.

... MacTest Pro CD ...

If a PowerBook 160 has been set to "24 bit mode", the MacTest Pro CD will not boot the machine. You may boot from the MTP Emergency disk, or you may set the PowerBook 160 to "32 bit mode", then boot from the CD.

Because Display Service Utility's "settings restore" option creates a file to temporarily store settings, it cannot be run from the CD-ROM or other locked media. Move the Display Service Utility to the hard drive or to an unlocked disk before using it.

If you boot a Macintosh Classic II, Color Classic, or SE30 from the MacTest Pro CD, then use the Shutdown option in the "Special" menu within the MacTest Pro application, you may get a dialogue box requesting that you "Please insert the disk: MacTest Pro", even though the CD is still in the drive. After a moment the Macintosh will shut down properly, however you may need to eject the CD manually. To avoid this problem, quit MacTest Pro, and then use the Finder "Special" menu, Shutdown option.

... MacTest Pro Application ...

Help text cannot be printed.

Drag launching a test module causes window refresh problems, and the module will not appear in the Test Selection region of the Main Window until you refresh the window. Also, a "did not load" message will appear in the Operation Info log even though the test module actually did load.

Test modules that turn off AppleTalk (see User's Guide for additional information) can interrupt some network services, such as the Apple Laserwriter Bridge. This results in an alert to the user, which must be dismissed by the user before testing will continue. This interruption can impact the looping of tests. Do not leave the machine unattended until at least one loop of testing

has been completed.

If you already have a version of the Help test module loaded in MacTest Pro, do not manually load another version of the Help test module. If you wish to use a different version of the Help test module, quit MacTest Pro, move the old version out of the Test Modules folder, and replace it with the new Help test module.

... MTP Emergency Application...

Always connect SCSI hard drives to the standard SCSI connections provided by the Macintosh hardware before running diagnostic tests. If you run hard drive tests on drives connected to a 3rd party SCSI bus (i.e. expansion slot card), then MacTest Pro may hang, or may incorrectly report a hard drive failure. If you subsequently run a Logic Board Test, MacTest Pro may incorrectly report a logic board failure. Do not reject a hard drive or logic board based solely on these false reports. Turn off the Macintosh, reconnect the SCSI hard drive to a standard SCSI connection and restart the Macintosh. Then launch MacTest Pro and start the tests again.

On a PowerBook or PowerBook Duo, always disconnect external monitors before running MTP Emergency, unless you are specifically testing the external VRAM. In that case, be sure that video mirroring is OFF before launching MTP Emergency, otherwise the system may crash.

On a PowerBook Duo 250 running under System 7.1, MTP Emergency may incorrectly identify the machine as a PowerBook Duo 230.

On a Macintosh Centris 660AV, MTP Emergency may quit with a "type 3 (illegal instruction) error" after looping for four or more hours, when the machine is booted from the CD or a floppy. Do not reject a logic board based solely on this behavior. Boot the computer from the hard drive, and rerun the test.

On the Macintosh Centris 610 and Quadra 610, MTP Emergency may crash or hang after looping for four or more hours; do not reject a logic board based solely on this behavior.

On the Macintosh Centris 610 and Quadra 610 MTP Emergency may incorrectly report that VRAM has failed at address "\$1"; do not reject VRAM or a logic board based solely on this behavior.

On a Macintosh 630 or 640 series DOS Compatible computer, MTP Emergency may quit with a "type 2 (address) error" after looping for four or more hours, when the machine is booted from the CD or a floppy. Do not reject a logic board based solely on this behavior. Boot the computer from the hard drive, and rerun the test.

To launch MTP Emergency on a Macintosh LC which has System 6.0.8 on the internal hard drive, you must boot from the MTP Emergency disk. (On a Macintosh LC, if you boot with System 6.0.8 from the hard drive, and then launch MTP Emergency from either the hard drive or a floppy, the machine will hang. If you attempt to launch MTP Emergency from the CD, an inappropriate dialogue will appear indicating that the CD desktop is damaged and must be rebuilt, which is not true

since the CD is read-only media.)

On some machines (e.g. the Macintosh Quadra 900, the Macintosh LC II, and the PowerBook 540), the percent numbers reported in the status line "Running Video RAM test... (___% complete)" do not appear to match the patterns being displayed on the monitor. This is caused by the interaction between the screen-handling routine and interrupt timing, and does not indicate any problem with the functionality of computer's VRAM or with the VRAM test.

The CPU clock speed that is displayed in the Hardware Info Log and by MTP Emergency is an approximation based on information gathered from the system; the presence of accelerator cards may affect the accuracy of this information.

... Communication Ports Tests ...

Do not loop the Network File Transfer option of the Communication Ports Tests in combination with logic board tests. If the looping feature is used with a logic board test marked "(Must Restart)", then the Network File Transfer test will report a false failure.

The Network File Transfer option of the Communication Ports Tests requires that the file server selected in the Setup window be in the same "zone" as the test machine; if it is not, then the Network File Transfer test may report a false failure.

... Ethernet Card Tests ...

The "Test Info" and the "Operation Info" in the MacTest Pro application state that you may run the Ethernet Card Tests while the card is connected to a network. This is INCORRECT. Running the test while connected to a network may result in a crash or false failure of the test. To run the test correctly, disconnect the card from the network, and restart the Macintosh before launching MacTest Pro.

... Mass Storage Device Tests ...

The Mass Storage Device Tests module is designed to test all CD-ROM drives, hard drives and tape drives released by Apple, when installed with driver software by Apple. The test module will load and attempt to run on non-Apple devices (see below) and/or with non-Apple drivers (such as FWB CD-ROM Toolkit), however MacTest Pro has not been tested with third-party CD-ROMs and drivers.

Mass Storage Device Tests does not currently support CD-ROMs with blocksizes other than 2048 bytes, or hard drives with blocksizes other than 512 bytes (such as 4Gb drives which may have blocksizes larger than 512 bytes). Any results which may be obtained will not be reliable.

Mass Storage Device Tests can test a PCMCIA card which is an IDE hard drive (except on PowerBook 500 series computers). The test module may load and attempt to test other PCMCIA devices (such as flash cards), however any test results which may be obtained will not be reliable.

When you are testing a DDS-DC tape drive, be sure to use a properly formatted

known-good tape (for example, if you insert a 'Helical Scan' tape, the test will fail). Also, if the write protect switch on the tape is enabled, the test will fail.

When running Mass Storage Device Tests, if the CD-ROM test disc was already inserted in the CD-ROM drive when a test failure is detected, the CD-ROM test disc may not eject from the CD-ROM drive. To eject the CD-ROM test disc, run the CD-ROM portion of the Mass Storage Device Tests again, and then cancel the test after the CD-ROM test disc is ejected. Or, reboot the computer, and the CD-ROM test disc will be ejected automatically.

VERSION INFO

Information about the current versions of System Enablers, and MacTest Pro test modules can be found in the accompanying VERSION INFO file.

Version info document can be found in TIL article 19897.

MacTest Pro for Power Macintosh Version Info (1/97)

Article Created: 29 May 1996
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This article is the MacTest Pro for Power Macintosh Version Information file.

DISCUSSION -----

The information in this VERSION INFO file is effective as of 02/21/96, and remains effective until the next update of MacTest Pro for Power Macintosh.

SUMMARY -----

This file contains useful information about the current versions of all MacTest Pro for Power Macintosh test modules and disks, as well as all currently available System Enablers.

MacTest Pro disk	Current Version	Notes

MacTest Pro (App+Mods1 PPC)	1.0	
MacTest Pro (App+Mods2 PPC)	1.0	
MTP Emergency (NuBus PPC)	1.0	1
MTP Emergency (PCI PPC)	1.0	2
MacTest Pro (PPC)	1.0	

Notes:

- 1 - 1.44 MB disk for use on Power Macintosh computers with NuBus slots
- 2 - 1.44 MB disk for use on Power Macintosh computers with PCI slots, and PowerPC based PowerBooks**

** The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, and 1400cs. Additionally

..TIL19884-MacTest_Pro_for_Power_Macintosh_Version_Info_1-97.pdf

PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

Test Module/Application Name	Current Version	Notes
MacTest Pro for Power Macintosh	1.0	
MTP Emerg (PPC)	1.0	1
Ethernet Card Tests (PPC)	1.0	
Expansion Card Tests (PPC)	1.0	
File Checker (PPC)	1.0	
Floppy Drive Tests (PPC)	1.0	
Hardware Info (PPC)	1.0	
Mass Storage Device Tests (PPC)	1.0	
Power Macintosh Tests Vol. 1	4.1	
Power Macintosh Tests Vol. 2	1.0.2	
Power Macintosh Tests Vol. 3	3.0	
PowerBook Series Tests (PPC)	1.0	
RAM/VRAM Tests (PPC)	1.0	
Software Info (PPC)	1.0	
Serial Loopback Tests (PPC)	1.0	

Notes:

- 1 - available on the MTP Emergency disks and MacTest Pro CD (PPC) only.

..... SYSTEM ENABLERS

The most current System Enablers are located in the System Enablers folder located on the MacTest Pro CD.

In some situations, the field appearing in several MacTest Pro windows that identifies the name of the machine being tested can be left blank or list a non-specific computer, e.g. "Macintosh". It can occur when using System 7.5 (or later). The correct name should still appear in the Hardware Info Log. Also the blank, or non-specific field display does not impact tests in any way. You can sometimes change the machine name display by removing from the bootable disk any System Enablers that are not required for the machine under test. Refer to the list of System Enablers below to determine which Enabler is required for each machine.

..... PERFORMA SYSTEM ENABLERS

Macintosh Performa 6100 series machines do not require System Enablers, however they do require System 7.5 or later.

Performa	System Enabler	Current Version	Notes
Performa 5200 series	System Enabler 406	1.0	A, B
Performa 5300 series	System Enabler 406	1.0	A, B
Performa 6200 series	System Enabler 406	1.0	A, B
Performa 6300 series	System Enabler 406	1.0	A, B

Notes:

- A - Requires System Software 7.5
- B - Requires System 7.5 Update 1.0

..... MACINTOSH & POWERBOOK SYSTEM ENABLERS

All bootable MacTest Pro Emergency (1.44) disks include System 7.5 and the appropriate Enabler files for the machines that are tested with those disks. Following is a list of the current Enabler files, the machines they support, and the current version numbers.

Most machines that require System Enablers prior to System 7.5, do not require those Enablers when running System 7.5 (or later).

Macintosh	System Enabler	Current Version	Notes
PowerBook 2300/5300	PowerBook 5300/2300/190 Enabler	1.2.1	D
Power Macintosh (NuBus only)	PowerPC Enabler	1.1.1	A
Power Macintosh 5200/75LC	System Enabler 406	1.0	A,B
Power Macintosh 5300/100LC	System Enabler 406	1.0	A,B
Power Macintosh 7200 series	System Enabler 701	1.1	D
Power Macintosh 7500/100	System Enabler 701	1.1	D
Power Macintosh 8500/120	System Enabler 701	1.1	D
Power Macintosh 9500 series	System Enabler 701	1.1	D
Workgroup Server 6150/66	WKGS Enabler	1.0	C
Workgroup Server 8150/110	WKGS Enabler	1.0	C
Workgroup Server 9150/120	WKGS Enabler	1.0	C

Notes:

- A - Requires System Software v7.5 or later

Printers: General Information on Metric Paper Sizes (5/96)

Revised: 5/29/96
Security: Everyone

Printers: General Information on Metric Paper Sizes (5/96)

=====

Article Created: 29 May 1996

TOPIC -----

This article contains information on different Metric paper and envelope size dimensions.

DISCUSSION -----

ISO Paper Sizes
=====

The paper formats defined by ISO in the A, B and C series are used today in nearly all countries apart from North America.

The formats have been determined according to the following rules:

- A0 has an area of one square meter.
- The aspect ratio of all members of the A, B and C-series is $\sqrt{2} = 1.41421\dots$
- You get the next higher format by cutting the paper in two equal pieces parallel to the shorter side. This results again in a 1 : $\sqrt{2}$ format (that's the big advantage of this format).
- The size of a B-series paper is the geometric mean between the size of the corresponding A-series paper and the next bigger A-series paper. For example, B1 is between A1 and A0.
- The size of a C-series paper is the geometric mean between the size of the A-series and B-series paper with the same number.

This means that the following formulas give the dimensions in meters:

Begin_Table

Paper Size	Width	Height
A-series	$2^{(-1/4 - n/2)}$	$2^{(1/4 - n/2)}$
B-series	$2^{(-n/2)}$	$2^{(1/2 - n/2)}$
C-series	$2^{(-1/8 - n/2)}$	$2^{(3/8 - n/2)}$

End_Table

Larger sizes have smaller numbers. Sizes larger than those with $n = 0$ are written as 2 A0 and 4 A0 rather than A(-1) and A(-2).

The following table lists the official definitions of the paper sizes which are the values from the above formulas rounded more-or-less to an integral number of millimeters:

Begin_Table

Paper Size	Dimension (millimeters)	Paper Size	Dimension (millimeters)	Paper Size	Dimension (millimeters)
4 A0	1682 x 2378				
2 A0	1189 x 1682				
A0	841 x 1189	B0	1000 x 1414	C0	917 x 1297
A1	594 x 841	B1	707 x 1000	C1	648 x 917
A2	420 x 594	B2	500 x 707	C2	458 x 648
A3	297 x 420	B3	353 x 500	C3	324 x 458
A4	210 x 297	B4	250 x 353	C4	229 x 324
A5	148 x 210	B5	176 x 250	C5	162 x 229
A6	105 x 148	B6	125 x 176	C6	114 x 162
A7	74 x 105	B7	88 x 125	C7	81 x 114
A8	52 x 74	B8	62 x 88	C8	57 x 81
A9	37 x 52	B9	44 x 62	C9	40 x 57
A10	26 x 37	B10	31 x 44	C10	28 x 40

+=====+=====+=====+=====+=====+=====+

End_Table

Some of the more popular sizes

Begin_Table

Size		Purpose
A0		technical drawings
A4		letters, magazines, documents
A5		books
C4,C5,C6		envelopes
B4,A3		supported by many copy machines, newspapers

End_Table

There are also strip formats possible, for example:

Begin_Table

Size	Dimensions
1/3 A4	99 x 210
2/3 A4	198 x 210
1/4 A4	74 x 210
1/8 A4	37 x 210
1/4 A3	105 x 297
1/3 A5	70 x 148

End_Table

All these formats are paper end formats. In other words, these are the dimensions of the paper delivered to the user/reader. Other standards define slightly bigger paper sizes for applications where the paper will be cut to the end format later (for example, after binding).

The ISO DL envelope format has the dimensions 220 x 110 millimeters.

The values contained in this Tech Info Library article come from DIN 476 (Dec 1976) which is the German version of the ISO 216 standard.

Power Macintosh 5400/120: Description (10/96)

Revised: 10/9/96
Security: Everyone

Power Macintosh 5400/120: Description (10/96)

=====

Article Created: 29 May 1996
Article Reviewed/Updated: 9 October 1996

TOPIC -----

This article contains a description of the Power Macintosh 5400/120 computer.

NOTE: This computer is only available through educational channels.

DISCUSSION -----

Overview

=====

With its state-of-the-art RISC-based processor and advanced multimedia capability, the all-in-one Apple Macintosh Power Macintosh 5400 computer is ready to inspire your creativity and boost your productivity.

The computer's 120-megahertz PowerPC 603e processor and 16 megabytes of RAM let you easily run an abundance of Macintosh applications—and there's plenty of room to store them on the 1.6 GB internal hard drive.

The Power Macintosh 5400 includes a CD-ROM drive for multimedia applications and a 15-inch monitor (12.8-inch diagonal viewable image size) to display vibrant colors. There's also a built-in microphone to directly record your own sounds. Multimedia play-back is made more lifelike through the built-in stereo speakers enhanced by SRS 3D surround sound and the Macintosh 16-bit stereo sound system.

Today, more and more computer users are discovering the wealth of information and communications resources and opportunities offered by the Internet. The Power Macintosh 5400/120 makes it easy to get involved in this rapidly expanding community, because it comes with all of the software you need for easy Internet access.

If you need even more advanced capabilities in the future, expansion is easy through the industry-standard Peripheral Component Interconnect (PCI) slot and built in SCSI support.

Features

=====

Power and Speed

- 120 MHZ 603e processor
- 32K internal cache
- Optional High Performance Module (256K level 2 cache)

Memory and Storage

- 16 MB of RAM (expandable to 136 MB)
- 1 MB DRAM frame buffer (separate from RAM) for video memory, not expandable
- Apple SuperDrive floppy disk drive (reads and writes Mac OS, Windows, DOS, OS/2, and ProDOS files)
- Internal 1.6 GB hard disk drive
- Internal quadruple- or 8x-speed CD-ROM drive, depending on configuration

Display

- 15-inch multiple-scan color display (supports more than 32,000 colors)

Expansion

- 7" PCI expansion slot
- I/O communications slot for Ethernet networking (accepts Twisted Pair, Thin Coax, or AAUI Ethernet Cards)
- Has video slot for NTSC, PAL, and SECAM video-input card
- Includes expansion bay for television tuner
- External drop box provides expansion for NTSC or PAL video output

Built-in Multimedia Technologies

- Optional Video capture card lets you record video from camcorder, VCR, or laserdisc. Note: Some configurations of the Power Macintosh 5400/120 include this card.
- Optional Video-out connector for connecting to an LCD projection panel or a second monitor
- Optional TV Tuner
- 16-bit sound in/out with SRS 3D surround sound enhancement

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server
- Includes 10 Base-T Ethernet networking with the Apple 10BaseT Ethernet CS II card

Ordering Information

•Power Macintosh 5400/120 (16/1.6GB) with built-in 15-inch multiple-scan color display, AppleCD 600i Plus CD-ROM drive, stereo speakers, microphone, AppleDesign Keyboard, and mouse.
Order No. B2765LL/A

Ordering Information

•Power Macintosh 5400/120 (16/1.6GB) with built-in 15-inch multiple-scan color display, 8x-speed CD-ROM drive, stereo speakers, microphone, AppleDesign Keyboard, and mouse.
Order No. M5184LL/B

Note: This configuration is available in the Higher Education channel ONLY.

Optional Enhancements

•High Performance Module (256K level 2 cache)
Order No. M4505LL/A

•Apple Video System
Order No. M2894LL/D

•Apple TV/FM Radio System
Order No. M4586LL/A

•Apple Presentation System
Order No. M2895LL/A

•External Video Connector
Order No. M4099LL/D

•10Base2 (thin coax) Ethernet Card
Order No. (M4773ZM/A)

•AAUI (Apple standard) Ethernet Card
Order No. M4774ZM/A

•PC Compatibility Card with 586 100-MHz processor
Order No. M4091LL/B

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

Article Change History:

09 Oct 1996 - Revised order number for PC Compatibility Card.
12 Aug 1996 - Clarified video capture card configuration.

H.320/ISDN Dialing Strings for Apple Media Conference (5/96)

Revised: 5/29/96
Security: Everyone

H.320/ISDN Dialing Strings for Apple Media Conference (5/96)

=====

Article Created: 29 May 1996

TOPIC -----

How do I enter the SPIDs (Service Provider IDs) in Apple Media Conference for an ISDN line if it's an NI1 line, or if it's a 5ESS line?

DISCUSSION -----

In the United States there are two standards of ISDN lines, National Internet 1 (NI1) and 5ESS. The two standards were created by Northern Telecom and AT&T respectively when the initial H.320 specification did not clearly define the protocol that is used on the D (signaling) channel. Which standard you use depends on what type of equipment has been installed at you telephone provider's central office.

NI1 internet service usually consists of two separate SPIDs. One number for each B (bearer) channel. Typically these B channels are 64 Kbps wide, and when bonded, can provide a 128 Kbps effective throughput connection (144 Kbps including 16 Kbps D channel).

5ESS service usually consists on only one SPID that represents both B channels. AT&T initially thought they might run out of phone numbers, so their switch uses the single number to activate 2 B channels, all seamless to the ISDN customer. Typically these 5ESS B channels are 56 Kbps wide, and when bonded, can provide a a 112 Kbps effective throughput connection (128 Kbps including 16 Kbps D channel).

So with that in mind, here are some sample strings you might use when dialing an ISDN line from Apple Media Conference.

Sample local call, 1 channel
XXXXXXX

Sample local call, 2 channels*
XXXXXXXX&XXXXXXXX

Sample local call, 1 channel needing outside line prefix
9XXXXXXX or 8XXXXXXX

Sample local call, 2 channels* needing outside line prefix
9XXXXXXX&9XXXXXXX or 8XXXXXXX&8XXXXXXX

Sample long distance call (800 area code), 1 channel
1800XXXXXXX

Sample long distance call (800 area code), 2 channels*
1800XXXXXXX&1800XXXXXXX

Sample long distance call (800 area code), 1 channel outside line prefix
91800XXXXXXX or 81800XXXXXXX

Sample long distance call (800 area code), 2 channels* outside line prefix
91800XXXXXXX&91800XXXXXXX or 81800XXXXXXX&81800XXXXXXX

Sample long distance call (800 area code), 1 channel long distance access code
103331800XXXXXXX

Sample long distance call (800 area code), 2 channels long distance access code
103331800XXXXXXX&103331800XXXXXXX

* 2 Channel calls requiring both numbers are applicable ONLY when calling a
H.320 system using a NI1 line.

Color LaserWriter 12/600 PS: Printer Utility and Win95 (3/97)

Revised: 3/10/97
Security: Everyone

Color LaserWriter 12/600 PS: Printer Utility and Win95 (3/97)

=====

Article Created: 30 May 1996

TOPIC -----

I want to turn off the startup page on my Color LaserWriter 12/600 PS from my Windows 95 computer. I am using the bi-directional parallel cable to connect to the printer.

DISCUSSION -----

You cannot use the Apple Printer Utility under Windows 95 except through Netware configurations. On Windows 95 you can use the Apple Printer Utility with NetWare only. If you do not have NetWare you can use the Apple Printer Utility on the parallel port from a Windows 3.1 system.

When you run the Apple Printer Utility, it gives you two options: Parallel and Network. Parallel is automatically greyed out. This is normal. The Network option is for using the utility through a Netware connection.

Article Change History:

LaserWriter 16/600 PS: Novell Frame Types (5/96)

Revised: 5/31/96
Security: Everyone

LaserWriter 16/600 PS: Novell Frame Types (5/96)

=====

Article Created: 30 May 1996

TOPIC -----

I am running a Novell Network, and have multiple frame types, 802.2 and 802.3. When I startup my LaserWriter 16/600ps it will only see part of my network. I have isolated it down to the frame type. I have concluded that it switches frames types randomly. Is there a way to manually set it? Is it possible to lock this setting in?

DISCUSSION -----

The LaserWriter 16/600 PS sends a request to the network at startup. Whichever server responds first determines the frame type the printer will use. There is no software that allows you to switch or manually set this option. You may want to contact Novell for suggestions on using the same frame type across your network.

Color LaserWriter 12/600PS: Installing Internal Hard Drive(5/96)

Revised: 6/3/96
Security: Everyone

Color LaserWriter 12/600PS: Installing Internal Hard Drive(5/96)

=====

Article Created: 30 May 1996

TOPIC -----

I'm trying to install an internal 40 MB hard drive into my Color LaserWriter 12/600 PS. It is not recognizing the hard drive. When I power up the printer, the status panel indicates a hard drive error; the following LEDs are on: [Paper Out/Paper Jam/Magenta toner/Maintenance Light #2].

When installing the hard drive, I noticed that the connector on the hard drive is larger than the ribbon cable connector. On which side of the hard drive connector should I align the ribbon cable?

DISCUSSION -----

It's likely that the ribbon cable is not properly connected to the hard drive.

Align the ribbon cable on the left side of the hard drives connector. After the ribbon cable is connected, there should be four rows of pins exposed on the right side of the hard drive connector.

Apple Remote Access and Shutdown Delay (5/96)

Revised: 5/30/96
Security: Everyone

Apple Remote Access and Shutdown Delay (5/96)

=====

Article Created: 30 May 1996

TOPIC -----

Why does my Power Macintosh 9500 freeze on shutdown when the Apple Remote Access (ARA) 2.0.1 extension is active? How can I stop this from happening?

DISCUSSION -----

Your Power Macintosh 9500 is technically not freezing, it is pausing as ARA examines the serial port during the shutdown process. Since the pause may take up to 10 minutes, the computer certainly could appear to be frozen. Upgrading your system software with System 7.5 Update 2.0 will solve this issue.

NOTE: This issue seems to occur when using an external modem and not when using a GeoPort. This is because the GeoPort uses its own drivers, while an external modem communicates through the serial port drivers which is causing this issue.

PC Compatibility Cards: General Questions & Answers (11/96)

Revised: 11/14/96
Security: Everyone

PC Compatibility Cards: General Questions & Answers (11/96)

=====

Article Created: 30 May 1996
Article Reviewed/Updated: 14 November 1996

TOPIC -----

The article answers the following general questions about Apple's PCI PC Compatibility Cards:

1) Previously PC/DOS Compatibility cards did not have joystickA/joystickB capabilities. Because of this, customers were not able to hook up the 'enhanced' joysticks that are becoming more common (FlightStick Pro, Wingman Extreme, etc). Do these new PC Compatibility Cards have full joystick port capabilities?

2) The APPLEVDO.INF file that comes with PC Setup 1.5 has VDIFs for Apple's current display models for Windows 95. Some customers have asked for a monitor description file for their Apple monitors on 'real' PC-compatible computers. The refresh rates for the generic SVGA VDIFs included with Win95 are not very good. Will this file be posted to Apple's Software Updates areas?

3) In Appendix D of the 7-inch PC Compatibility Card User Manual (technical specifications), it states that the card is compatible with 640 x 480 and 800 x 600 resolutions. However, Appendix C of the user manual refers to resolutions up to 1280 x 1024. Why is Appendix C different from Appendix D?

4) Some customers must provide their Ethernet addresses before being allowed to connect to their university or business network. Because of the processor chipset on the new PC Compatibility cards (Curio Prime) having two Ethernet IDs, some customers will need to provide BOTH of these ID numbers. Is there any way to find out both Ethernet IDs? Do the processor chipset's (Curio Prime) dual Ethernet IDs share the network bandwidth or do they each have a full 10 MB bandwidth?

5) How does Apple officially distinguish between the two PC Compatibility cards? I have seen them referred to as "the 7-inch card" or "the 12-inch card" as well as by "with Pentium" or "with 586". Which is correct?

6) How much and what kind of VRAM (video DRAM) come with the PC Compatibility Cards?

DISCUSSION -----

1) Question: Previously PC/DOS Compatibility cards did not have joystickA/joystickB capabilities. Because of this, customers were not able to hook up the 'enhanced' joysticks that are becoming more common (FlightStick Pro, Wingman Extreme, etc). Do these new PC Compatibility Cards have full joystick port capabilities?

Answer: The joystick port does support both A and B channel, so the enhanced joysticks should work.

2) Question: The APPLEVDO.INF file that comes with PC Setup 1.5 has VDIFs for Apple's current display models for Windows 95. Some customers have asked for a monitor description file for their Apple monitors on 'real' PC-compatible computers. The refresh rates for the generic SVGA VDIFs included with Win95 are not very good. Will this file be posted to Apple's Software Updates areas?

Answer: The APPLECD0.INF file will be posted to all of Apple's Software Updates sites.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

3) Question: In Appendix D of the 7-inch PC Compatibility Card User Manual (technical specifications), it states that the card is compatible with 640 x 480 and 800 x 600 resolutions. However, Appendix C of the user manual refers to resolutions up to 1280 x 1024. Why is Appendix C different from Appendix D?

Answer: Appendix D refers to SVGA modes that are supported by the 7-inch PC Compatibility card. Appendix C covers resolutions the 7-inch PC Compatibility card can support with multiple-scan monitors only.

The 12-inch PC Compatibility card can have an additional 1 MB of VRAM added to it which allows it to support the additional SVGA modes of 1024 x 768 and 1280 x 1024.

4) Question: Some customers must provide their Ethernet addresses before being allowed to connect to their university or business network. Because of the processor chipset on the new PC Compatibility cards (Curio Prime) having two Ethernet IDs, some customers will need to provide BOTH of these ID numbers. Is there any way to find out both Ethernet IDs? Do the processor chipset's (Curio

Prime) dual Ethernet IDs share the network bandwidth or do they each have a full 10 MB bandwidth?

Answer: The Ethernet addresses are sequential. The forty-eighth bit of the address is ignored at the data link error. Any utility that worked on the PC to get the Ethernet address should still work. One example is Netmanage's Chameleon. It displays the Ethernet address on the PC in its configuration window. WINIPCFG.EXE also returns the Ethernet address. This is included with Microsoft TCP/IP in Windows 95.

5) Question: How does Apple officially distinguish between the two PC Compatibility cards? I have seen them referred to as "the 7-inch card" or "the 12-inch card" as well as by "with Pentium" or "with 586". Which is correct?

Answer: The official names are:

- 7-inch PC Compatibility Card
586 processor
- 12-inch PC Compatibility Card
Pentium processor

6) Question: How much and what kind of VRAM (video DRAM) come with the PC Compatibility Cards?

Answer:

7 Inch (586 Card)

1 MB video DRAM, non-expandable

12 Inch (Pentium Card)

1 MB video DRAM (physical/logical), expandable to 2 MB(physical/logical) total using:

Two of the 5V, 256K x16, 60 ns, standard fast paged mode SOJ (standard outer J pin) package DRAM chips (40-pin).

Some sample manufacturers and their part numbers are:

Micron #MT4C16257DJ-6

NEC #UPD424260LE60R

Samsung #KM416C256BJ-6

Hyundai #HY514260BJ-60

Plenum Cable Definition (5/96)

Revised: 5/30/96
Security: Everyone

Plenum Cable Definition (5/96)

=====

Article Created: 30 May 1996

TOPIC -----

I sometimes see network cabling referred to as "plenum" cable. What does this mean?

DISCUSSION -----

Plenum is the area between the ceiling and the floor above it. This is a common location for network cabling. Some federal, state and local fire codes restrict the type of cabling (for data and other uses) than can be installed in this area.

Plenum cable is usually teflon-coated. In the event of a fire, it is designed to burn without giving off toxic fumes. Fire code restrictions typically require non-plenum cable to be installed in a protective conduit.

MacTest Pro For 68k Macintosh Computers Version Info (6/96)

Revised: 5/30/96
Security: Everyone

MacTest Pro For 68k Macintosh Computers Version Info (6/96)

=====

Article Created: 29 May 1996

TOPIC -----

This article is the MacTest Pro for 68K Macintosh computers Version Information file.

DISCUSSION -----

..... VERSION INFO

The information in this VERSION INFO file is effective as of 02/21/96, and remains effective until the next update of MacTest Pro.

SUMMARY

This file contains useful information about the current versions of all MacTest Pro 68K test modules and disks, as well as all currently available System Enablers.

MacTest Pro disk	Current Version	Notes

MacTest Pro (App+Mods Vol1)	7.0	
MacTest Pro (App+Mods Vol2)	7.0	
MTP Emergency (SSW 6.0.8)	5.0	2
MTP Emergency (680x0)	5.0	1
MacTest Pro CD	5.0	

Notes:

- 1 - 1.44 MB disk, for use on 68K Macintosh computers with 1.44 MB floppy drive.
- 2 - 800 K disk, for use on 68K Macintosh computers with 800K floppy drive.

Test Module/Application Name	Current Version	Notes
MacTest Pro Application	1.3	
MTP Emergency Application	1.1	1
Communication Ports Tests	1.3	
DOS Compatible Card Tests	2.0	
Ethernet Card Tests	2.0	
Expansion Card Tests	3.0	
File Checker	2.1.1	
Floppy Drive Tests	1.2	
Hardware Info	1.9.7	
Machine Checker	1.5	
Macintosh Tests Vol. 1A	3.0	
Macintosh Tests Vol. 1B	2.0	
Macintosh Tests Vol. 2	7.0.1	
Macintosh Tests Vol. 3	2.0	
MacTest Pro Help (B&W)	2.0	
Mass Storage Device Tests	3.0	
Modem Tests	1.1	
Power Macintosh Card Tests	2.0	
PowerBook Series Tests	2.0	
RAM/VRAM Tests	1.0.1	
Software Info	1.9.1	
Workgroup Server PDS Card Tests	1.1	

Notes:

1 - available on the MTP Emergency disks and MacTest Pro CD only.

.....
..... SYSTEM ENABLERS

The most current System Enablers are located in the System Enablers folder located on the MacTest Pro CD.

In some situations, the field appearing in several MacTest Pro windows that identifies the name of the machine being tested can be left blank or list a non-specific computer, e.g. "Macintosh". This occurs on some machines when both a regular Macintosh System Enabler and a newer Performa System Enabler (3xx series) are on the same bootable disk. It can also occur when using System 7.5 (or later). The correct name should still appear in the Hardware Info Log. Also the blank, or non-specific field display does not impact tests in any way. You can sometimes change the machine name display by removing from the bootable disk any System Enablers that are not required for the machine under test. Refer to the list of System Enablers below to determine which Enabler is required for each machine.

..... PERFORMA SYSTEM ENABLERS

The Macintosh Performa 200, 400, 405, 410, and 430 do not require System Enablers.

The Performa 580CD and 640 series require System Software 7.5, and System 7.5 Update 1.0.

Performa	System Enabler	Current Version	Notes
Performa 250	System Enabler 332	1.1	A, I
Performa 275	System Enabler 332	1.1	B, I
Performa 450	System Enabler 308	1.0	C, I
Performa 460/466/467	System Enabler 308	1.0	D, I
Performa 475/476	System Enabler 364	1.1	E, I
Performa 520	System Enabler 332	1.1	F, I
Performa 550	System Enabler 332	1.1	G, I
Performa 575/577/578	System Enabler 364	1.1	E, I
Performa 600	System Enabler 304	1.0.1	H, I
Performa 630 series	System Enabler 405	7.1.2p	J

Notes:

- A - Australia only market. Can also be tested using System Enabler 401 v1.0.5.
- B - Japan only market. Has no equivalent Macintosh System Enabler.
- C - Can also be tested using System Enabler 003 v1.1.
- D - Has no equivalent Macintosh System Enabler.
- E - Can also be tested using System Enabler 065 v1.2.
- F - Japan only market. Can also be tested using System Enabler 403 v1.0.2.
- G - Can also be tested using System Enabler 403 v1.0.2.
- H - Can also be tested using System Enabler 001 v1.0.1.
- I - Requires System Software 7.1p (Performa version)
- J - Requires System Software 7.1.2p (Performa version)

..... MACINTOSH & POWERBOOK SYSTEM ENABLERS

All bootable MacTest Pro Emergency (1.44) disks include System 7.5 and the appropriate Enabler files for the machines that are tested with those disks. Following is a list of the current Enabler files, the machines they support, and the current version numbers.

The Macintosh Plus, SE, SE/30, Classic, Classic II, LC, LC II, Macintosh II, IIX, IICX, IICI, IIFX; PowerBook 100, 140, 145, 145B, 170; Quadra 700, 900, 950; and Apple Workgroup Server 95/95+ do not require System Enablers.

The Macintosh LC 580 requires System Software 7.5, and System 7.5 Update 1.0. Most machines that require System Enablers prior to System 7.5, do not require those Enablers when running System 7.5 (or later).

Macintosh	System Enabler	Current Version	Notes
Macintosh IIfx	System Enabler 001	1.0.1	G
Macintosh IIfx	System Enabler 001	1.0.1	G
Macintosh LC III	System Enabler 003	1.1	G
Macintosh LC 475	System Enabler 065	1.2	G
Macintosh LC 520	System Enabler 403	1.0.2	G
Macintosh LC 550	System Enabler 403	1.0.2	G
Macintosh LC 575	System Enabler 065	1.2	G
Macintosh LC 630	System Enabler 405	7.1.2p	F

Macintosh Color Classic	System Enabler 401	1.0.5	GMacintosh
Centris 610	System Enabler 040	1.1	G
Macintosh Centris 650	System Enabler 040	1.1	G
Macintosh Centris 660AV	System Enabler 088	1.2	C, G
Macintosh Quadra 605	System Enabler 065	1.2	G
Macintosh Quadra 610	System Enabler 040	1.1	G
Macintosh Quadra 630	System Enabler 405	7.1.2p	F
Macintosh Quadra 650	System Enabler 040	1.1	G
Macintosh Quadra 660AV	System Enabler 088	1.2	C, G
Macintosh Quadra 800	System Enabler 040	1.1	G
Macintosh Quadra 840AV	System Enabler 088	1.2	G
PowerBook 150	PowerBook 150 Enabler	1.1	G
PowerBook 160	System Enabler 131	1.0.3	A, G
PowerBook 165	System Enabler 131	1.0.3	A, G
PowerBook 165c	System Enabler 131	1.0.3	A, G
PowerBook 180	System Enabler 131	1.0.3	A, G
PowerBook 180c	System Enabler 131	1.0.3	A, G
PowerBook 190 Series	PowerBook 5300/2300/190 Enabler	1.2.1	H
PowerBook Duo 210	PowerBook Duo Enabler	2.0	B, G
PowerBook Duo 230	PowerBook Duo Enabler	2.0	B, G
PowerBook Duo 250	PowerBook Duo Enabler	2.0	G
PowerBook Duo 270c	PowerBook Duo Enabler	2.0	G
PowerBook Duo 280	PowerBook Duo Enabler	2.0	D
PowerBook Duo 280c	PowerBook Duo Enabler	2.0	D
PowerBook 520/540	PowerBook 500 Series	1.0.2	D
Power Macintosh Upgrade Card	PowerPC Upgrade Card	1.0.1	G
Macintosh Processor Upgrade	601 Processor Upgrade	1.0	E
Workgroup Server 60	System Enabler 040	1.1	G
Workgroup Server 80	System Enabler 040	1.1	G
Apple Macintosh TV	System Enabler 404	1.0	G

Notes:

- A - System Enabler 131 replaces System Enabler 111 and System Enabler 121.
- B - PowerBook Duo Enabler replaces System Enabler 201.
- C - Macintosh Centris 660AV has been renamed to Macintosh Quadra 660AV.
- D - Requires System Software v7.1.1 or later.
- E - Requires System Software v7.5 or later.
- F - Requires System Software v7.1.2.
- G - Requires System Software 7.1
- H - Requires System Software v7.5.2 or later

7.5.3 and WGS95 PDS card (5/96)

Revised: 5/31/96
Security: Everyone

7.5.3 and WGS95 PDS card (5/96)

Article Created: 31 May 1996

TOPIC -----

A customer is trying to install system 7.5.3 on an Apple Workgroup Server 95. System 7.5 seems to install without problem but after installing the update 2.0, it hangs during the initial boot sequence.

DISCUSSION -----

This appears to be caused by the presence of the PDS card. The Apple PDS card included with the AWS 95 is only intended to be used with the Apple Workgroup Server 95 and Under the A/UX operating system shipped with it. This card was never tested under any other system software and none of the available versions of the Macintosh System software available now or in the future include drivers to support this card.

Retrospect 3.0: Virtual Memory and dev.c-1027 error (5/96)

Revised: 2/11/97
Security: Everyone

Retrospect 3.0: Virtual Memory and "dev.c-1027" error (5/96)

=====

Article Created: 30 May 1996

TOPIC -----

When I use Retrospect 3.0 on my PowerMacintosh 7250 and 8550 I get an error message "dev.c-1027."

DISCUSSION -----

Apple only supports Retrospect when it is bundled with the PowerMacintosh 7250 and 8550 computers, Dantz provides technical support any other configuration of this product.

The following workaround to this problem was posted to internet page:
<http://www.macintouch.com/>:

May 10, 1996: Here's a workaround from Dantz for a problem with Retrospect 3.0 in a configuration with more than 40 MB or RAM:

The following instructions patch Retrospect 3.0 to avoid an Assertion check at "dev.c-1027" error. This problem only occurs when you have more than 40 MB of installed RAM, and are also using Apple's Virtual Memory or RAM Doubler by Connectix.

- 1.Open your copy of Retrospect with ResEdit.
- 2.Find the 'Def#' resource and open it.
- 3.Scroll to the end and locate the text "key: PhMP".
- 4.Change the data field that says "\$00000028" to say "\$00000000".
- 5.Save and Quit.

Your patched copy of Retrospect 3.0 will now work properly with Virtual Memory or RAM Doubler enabled.

MAE: Explanation of Color Flashing (5/96)

Revised: 5/30/96
Security: Everyone

MAE: Explanation of Color Flashing (5/96)

=====

Article Created: 30 May 1996

TOPIC -----

Whenever I run a color intensive application on MAE (like Canvas or JPEGView) on my Sparc5 (Solaris 2.5, CDE 1.0.1), the non-MAE windows on my screen explode into a festive assortment of colors. Clicking out of the MAE window and back onto the CDE Workspace returns CDE to its proper colors, but causes the MAE images to go crazy. I've tried resetting the colormap (xstdcmap -all), which took care of some ghostview problems, but nothing has worked for MAE. Any suggestions?

DISCUSSION -----

This is called color flashing, and it is sometimes unavoidable. You apparently have an 8-bit display on your workstation. This means the hardware supports 256 simultaneous colors out of a possible 16 million.

As an example, what happens if MAE is using 256 colors and your other X applications are using some combination of 256 different colors? The X server notices which window has the colormap focus and loads the hardware colormap with the corresponding set of colors. Change the focus to a different window, and the server loads that window's set of colors.

To avoid this, use fewer colors or get a 24-bit framebuffer. Note also that the MAE General control panel has an option to help reduce flashing, but it has limitations.

MAE: Zero Key on Sun Type 5 Keyboard Does Not Work (5/96)

Revised: 5/30/96
Security: Everyone

MAE: Zero Key on Sun Type 5 Keyboard Does Not Work (5/96)

=====

Article Created: 30 May 1996

TOPIC -----

When running MAE and using a Sun Type 5 keyboard, the Zero key (0) on the keypad does not work.

DISCUSSION -----

Although the README for Patch 2.0 notes this as being fixed, the fix was never incorporated in the release. However, engineering has posted a release on [http:// www.mae.apple.com](http://www.mae.apple.com) or <ftp.support.apple.com> to correct this.

Locate the following directory:

/pub/mae/patches/mae_2.0_updates/sun_key_0

This directory contains keymap definitions for MAE v2.0 or 2.0.1 when using a Sun Type 5 keyboard. Specifically, the zero (0) key on the keypad will now function properly.

To install and use these files, perform the following steps:

Step 1

FTP all files in the directory `patches/mae_2.0_updates/sun_key_0' to your local workstation.

Step 2

Place the files (except for the README) into the directory:

lib/KeymapDepot/sun

This directory is located within the Apple directory in which you originally

installed MAE. Note that this action replaces the following files within the
`sun` subdirectory:

sun.default
sun.type5.PC.US
sun.type5.UK
sun.type5.US
sun.type5.french
sun.type5.german
sun.type5.japanese

Step 3

If you already had MAE active when you performed Steps 1 and 2, open the MAE
Keyboard Control Panel and select any file that is different from the one you
currently have selected. Then reselect your desired file. This action reloads
the keymap file with the new version. Alternatively, you can also perform the
Restart command from the Special menu in the MAE Finder.

Step 4

If you did not have MAE active when you replaced the files, no other actions are
necessary. The new keymaps will be utilized when you start MAE.

MAE 2.0: AT_sigio select:bad file number Shell Error (5/96)

Revised: 5/30/96
Security: Everyone

MAE 2.0: "AT_sigio select:bad file number" Shell Error (5/96)

=====

Article Created: 30 May 1996

TOPIC -----

While MAE is running, I notice the following error in the shell that MAE was started from:

AT_sigio select:bad file number

What is the reason for this, and what is the workaround?

DISCUSSION -----

This error is a result of too many open files within the MAE environment, and can be caused by several factors. This typically, but not always, occurs when attempting to perform a network function like printing, copying, and so on. These factors include:

- A large number of fonts.
- Several applications open at the same time.
- Applications that open files for temporary purposes, like 'scratch' files common in graphic applications.
- Database applications that open several resource files.
- Attempting to print files that have a large number of embedded graphics.
- Several users connected with Personal File Sharing while you attempt to open applications.
- A large number of control panels and/or extensions

To resolve this, you will first need to determine which of the factors above is causing this error message, and then minimize its use.

As of May 1996, there is no resolution to this issue. It is caused by NFILES in A/UX (MAE's source) hard coded to 128. This will not be addressed in MAE 2.0.x.

MAE 2.0: Appropriate Version of STREAMS With HP-UX 9.0.x (5/96)

Revised: 5/30/96
Security: Everyone

MAE 2.0: Appropriate Version of STREAMS With HP-UX 9.0.x (5/96)

Article Created: 30 May 1996

TOPIC -----

This article explains which version of the STREAMS package included on the MAE CD-ROM disc is appropriate for HP-UX 9.0.x. STREAMS is not necessary for either HP-UX 10.x, or for Solaris, because it's built into the OS.

NOTE: Apple has licensed the STREAMS package from HP for use with the AppleTalk kernel components within MAE. If a user has an issue with the STREAMS package, they should to contact their HP support representative.

DISCUSSION -----

Begin_Table

HP-UX Version	STREAMS version
-----	-----
9.0.1	STREAMS3
9.0.2*	STREAMS3
9.0.3	STREAMS3
9.0.4*	STREAMS5
9.0.5	STREAMS5
9.0.7	STREAMS5
9.0.8*	STREAMS5

End_Table

* These HP-UX version are also released for the HP9000 Series 800 systems, however, these OS versions will load on the HP9000 Series 700 systems. MAE is intended only for the HP9000 Series 700 systems.

MAE 2.0: UltraSPARC Issues (5/96)

Revised: 5/30/96
Security: Everyone

MAE 2.0: UltraSPARC Issues (5/96)

Article Created: 30 May 1996

TOPIC -----

What issues, if any are there with the UltraSPARC, Sun's new workstation?

DISCUSSION -----

MAE is supported on Sun's UltraSPARC workstation. However, there are a few issues that Apple is aware of at this time.

Failed to get ROM memory at startup of MAE

MAE 2 requires Patch 2 to run under Solaris 2.5 and the UltraSPARC. Upgrade MAE with this patch, and restart your workstation. Upon this restart, MAE will launch successfully.

AppleTalk and 'hme' network interface

MAE, by default, will change permission of the 'le' network interface to allow any user to use AppleTalk. However, the UltraSPARC has a new interface, called 'hme'. To let users, other than root, use AppleTalk on these systems, change the permissions of /devices/pseudo/clone@0:hme to 'rw' for all users.

UltraSPARC with Creator 3D Graphics card

If a user maximizes the MAE window, using the large box button on the upper right corner of the CDE Motif window, will no longer be refreshed, causing window positions to 'remove' items in the background.

This has been isolated to a bug within CDE and the 3D Graphics card. Apple and Sun engineering are currently working on a solution. The workaround is to not maximize the MAE window to the full size of the screen. Users can issue the command 'xrefresh', but this is not always capable of fixing this issue.

MAE 2.0 DEMO: Error fatal libX11.so.4: can't open file (6/96)

Revised: 6/6/96
Security: Everyone

MAE 2.0 DEMO: Error "fatal libX11.so.4: can't open file" (6/96)

=====

Article Created: 30 May 1996
Article Reviewed/Updated: 6 June 1996

TOPIC -----

I installed MAE 2.0 Demo and restarted my workstation. After adding the license.dat file in the apple directory, I attempted to start the MAE Demo and got the following error in the shell:

```
MAE 2.0.2LM Copyright 1994-1996 Apple Computer, Inc., All rights reserved.  
ld.so.1: /opt/apple/bin/legal: fatal: libX11.so.4: can't open file:  
errno=2  
Killed
```

What is the solution?

DISCUSSION -----

If your workstation is running Solaris, you need to include the following in the environment variable LD_LIBRARY_PATH directory /usr/openwin/lib.

```
For csh  
'setenv LD_LIBRARY_PATH /usr/openwin/lib'  
For sh or ksh  
'export LD_LIBRARY_PATH=/usr/openwin/lib'
```

MAE 2.0 Demo uses a default X Window that uses the libX11.so.4 file to state legal information, and uses that variable to locate the file.

PowerBook: Cable Identification List (4/97)

Article Created: 06 April 1996
Article Reviewed/Updated: 04 April 1997

TOPIC -----

This article describes the PowerBook cables, sales part numbers, and service part numbers.

DISCUSSION -----

Begin_Table

Name of Cable -----	Finished Goods -----	Service Part Number -----
HDI-30 SCSI System Cable	M2538LL/A	590-0717
HDI-30 SCSI Disk Adapter Cable	M2539LL/A	590-0718
PowerBook Video Adapter Cable	M3927LL/A	922-0831

End_Table

Apple HDI-30 SCSI System Cable

This cable is used to connect an external SCSI device to your PowerBook. The cable consists of an HDI-30 connector (male, 29 pins) and a Centronics 50 pin connector (male).

Apple HDI-30 SCSI Disk Adapter

This cable is used to connect your PowerBook to a desktop Macintosh computer in SCSI Disk Mode. The cable consists of an HDI-30 connector (male, 30 pins) and a Centronics 50 pins connector (male).

PowerBook Video Adapter Cable

This cable is used to connect an external monitor to the Micro DV-14 Video Out

..TIL19911-PowerBook-Cable_Identification_List_4-97_(TA35597).pdf

port on your PowerBook. The cable consists of a DV-14 connector (male) and a DB-15 connector (female).

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Monitors Control Panel and Hidden Resolutions (5/96)

Revised: 5/31/96
Security: Everyone

Monitors Control Panel and "Hidden" Resolutions (5/96)

=====

Article Created: 31 May 1996

TOPIC -----

I was told that my Macintosh Quadra 800 computer supports 800x600 video resolution. I know my monitor also supports this resolution, but I cannot see an option for 800x600 in the Monitors control panel. Is there something I can do to use this resolution?

DISCUSSION -----

800x600 is not a Macintosh resolution. However, some Macintosh computers can support this resolution when used with the appropriate monitor. Unfortunately, computers using System 7.5.1 and higher do not support non-Macintosh "hidden" resolutions, such as 800x600 and 640x400.

If your computer and monitor can both support the non-Macintosh resolution you are looking for, and you do not have System 7.5.1 or higher, you may be able to use the following procedure to select a non-Macintosh resolution.

Step 1

Choose Control Panels from the Apple Menu.

Step 2

Open the Monitors control panel.

Step 3

Hold down the Option key while clicking the 'Options' button in the Monitor control panel.

Step 3

Choose the desired resolution, then click OK.

MAE 2.0: Loss of AppleTalk (5/96)

Revised: 5/31/96
Security: Everyone

MAE 2.0: Loss of AppleTalk (5/96)

Article Created: 31 May 1996

TOPIC -----

MAE appears to lose it's access to the AppleTalk network. This typically occurs over the course of a few days, and I have to restart the workstation to get connected to the AppleTalk network again. Stopping and starting the AppleTalk stack with '~/apple/bin/appletalk' does not appear to help.

I sometimes see the error 'Unable to locate /tmp/AppleTalk.Muxid' in the shell that they start MAE from as well.

DISCUSSION -----

When this occurs, verify whether the file '/tmp/AppleTalk.Muxid' is present. If the file is missing, this would explain why MAE is no longer able to access the AppleTalk stack. This file is necessary for MAE to bring up and down the AppleTalk stack cleanly. If the file is removed while MAE is running, it will leave MAE in an odd state that can only be corrected by restarting of the workstation, which will bring the AppleTalk stack back into a clean state.

Some reasons why the file may be missing are; a cron job that deletes files in the /tmp directory at night, or a user indiscriminately removes items in /tmp.

Power Macintosh 5400 & 6400: Switching to Ethernet (10/96)

Revised: 10/29/96
Security: Everyone

Power Macintosh 5400 & 6400: Switching to Ethernet (10/96)

=====

Article Created: 31 May 1996
Article Reviewed/Updated: 29 October 1996

TOPIC -----

I have a Power Macintosh 5400/120 computer which comes with the Apple CS II Ethernet card pre-installed. Using the Network Software Selector, I have switched from Open Transport to Classic AppleTalk. However, the Network control panel does not have an option to switch to EtherTalk. I checked the Extensions folder and the Apple Ethernet CS II extension is installed. How do I switch to EtherTalk?

DISCUSSION -----

The Apple Ethernet CS II card and software only function under Open Transport. Under Classic AppleTalk, the Power Macintosh 5400/120 and Power Macintosh 6400 computers cannot switch to Ethertalk. To connect to an Ethernet network using the Apple Ethernet CS II card and the Power Macintosh 5400/120 or Power Macintosh 6400, you must switch to Open Transport, restart the computer, and then use the AppleTalk control panel to switch to Ethernet.

This article was published in the Information Alley on 3 June 1996.

Article Change History:
29 Oct 1996 - Added 6400 to the title.
20 Sep 1996 - Added Power Macintosh 6400 to discussion.

At Ease 3.0.2 Update: Read Me (5/96)

Revised: 6/3/96
Security: Everyone

At Ease 3.0.2 Update: Read Me (5/96)

=====

Article Created: 31 May 1996

TOPIC -----

This article contains the ReadMe file for the At Ease for Workgroups 3.0.2 Updater.

DISCUSSION -----

Contents

=====

Requirements for Updating

- Version 3.0 Already Installed
- Workgroup Version of At Ease
- Update Some or All Workstations
- Using an AppleShare Server for At Ease

Updating Procedure

- Installation Options
- Updating from the Floppy Disk
- Updating Over the Network
- Files the Updater Needs to Locate
- Use an Updated Copy of the Administration Program
- New Desktop Printer Extension

Changes in Version 3.0.2

- Using the Lock Startup Disk Feature
- System Startup Crash While Using Open Transport
- Fixed Possible HD Corruption on IDE Hard Disks When Using Lock Startup Vol Feature

Changes in Version 3.0.1

- Launching Applications from Other Applications
- Log-in Procedure
- At Ease Setup Changes

Clarifications

- Using Kid Pix Studio (Correction to Read Me for At Ease 3.0)
- CD-ROMs and At Ease
- Documents Created by Approved Applications
- Server Mounting in At Ease
- Disk Security
- At Ease and File Sharing
- Maximum Number of Connected Users on an At Ease Server
- Bypassing At Ease at Startup on Certain Power Macintoshes
- At Ease and RAM Doubler

Major Problems Corrected in Version 3.0.1 and 3.0.2

- Users Visible After Update from Version 2.x
- No Report of Damaged Preferences File at Log-in
- Faster Logging In or Out on Large Systems
- Documents Panel Remains Visible
- Setup Application Correctly Recognizes Setups
- Virex Incompatibility Corrected
- Items in the Apple Menu Remain Visible
- Servers Mount Correctly
- Import Users Function Works Correctly
- Middle Level Administration

The At Ease 3.0.2 Updater will update your current version of At Ease for Workgroups 3.0 or 3.0.1 to the latest version, 3.0.2. The change in version 3.0.2 includes three fixes: a fix to allow the Lock Startup Disk to work (under the constraints described later), a fix for a crash that occurs when starting an At Ease machine up with Open Transport, and a fix for possible HD corruption on IDE hard disks when using the "Lock startup volume" feature. A detailed list of all changes appears at the end of this document.

Requirements for Updating

=====

Version 3.0 Already Installed

You can only use the Updater application on a workstation that has version 3.0 or 3.0.1 installed. The Updater will not run if you have an older version (2.x or a lower number) installed. If you have an earlier version of At Ease for Workgroups, you should first update it to version 3, then use the Updater.

Workgroup Version of At Ease

Any workstation you update with the Updater must have At Ease for Workgroups installed. You should not use this Updater to update a workstation that has the non-workgroup version of At Ease installed. The updated software has not been

tested with the non-workgroup version, and most changes in this version involve network enhancements that will not be used in the non-workgroup version.

In addition, the Updater application will not update the version of At Ease Setup (the administration program) for the non-workgroup product. If you use the Updater on a non-workgroup workstation, you may not be able to run your existing At Ease Setup (non-workgroups) application on that workstation.

Update Some or All Workstations

The databases used by At Ease 3.0, 3.0.1, and 3.0.2 are fully compatible. That means you can update some At Ease workstations on the network and not update others. To benefit from all the enhancements in this version, however, you should update all of the workstations used by At Ease.

Using an AppleShare Server for At Ease -----

If your At Ease server is an AppleShare volume, all workstations must use version 3. Any workstation that has an older version of At Ease will get a message reporting that the At Ease Preferences file is bad when it tries to access the server.

Updating Procedure

=====

Installation Options

There are two ways of updating one or more machines using At Ease for Workgroups by using the Updaters floppy disk on each workstation or by installing the updated software over the network.

Updating from the Floppy Disk

1. Turn off At Ease on each workstation that you are updating. (See the users manual for instructions, if necessary.)
2. Insert the Updater disk.
3. Open the At Ease 3.0.2 Updater application.
4. Click Begin in the greeting that appears.
5. If the Updater cannot find a file it needs to update, a message appears asks you to locate that file. (If you cannot find the file, click Skip to cancel the update.)
6. Locate the missing file and repeat the update procedure.

Updating Over the Network

1. Copy the Updater application to an AppleShare server volume to which your workstations have access.
2. Make sure the application is locked. (Select the Updaters icon, choose Get

Info from the File menu, then click to place an X in the box labeled Locked.)

3. Turn off At Ease on each workstation you are updating.

Tip: Before updating any workstations on the network, you may want to turn At Ease off on machines you will be updating by using the Update Computers feature. Then, after you have updated your At Ease machines, you can turn At Ease on by using this same feature. (See the users manual for instructions, if necessary.)

4. Mount the server volume that contains the Updater application.

5. Open the Updater application.

6. Click Begin in the greeting that appears.

Files the Updater Needs to Locate

In most cases, the Updater will attempt to locate and update the At Ease and At Ease Startup files automatically. If it cannot find either of these files, it will ask you for the location of the missing file. If you cannot find these files, you can click the Skip button to stop the update, leaving your files as version 3.0 or 3.0.1.

Some administrators remove the administration program on certain workstations. For this reason, the Updater will display a message asking you to locate the setup program on your disk. If you cannot locate the program, click the Skip button to bypass this request.

Use an Updated Copy of the Administration Program

Be sure to update the copy of At Ease Setup (Workgroups) you use to administer At Ease to version 3.0.2. You should also remove any non-updated copies of this program from your hard disk (or disks). Do not leave multiple copies of the setup program on the workstations, because you may inadvertently open an old version of this program.

New Desktop Printer Extension

The Updater disk includes an Apple Extras folder. This folder contains a version of the Desktop Printer Extension that fixes some problems that may occur when using the restricted Finder mode in At Ease.

The Desktop Printer Extension is used by printer drivers for some of the newest printers. You only need to install this extension (version 1.03) if you are using an earlier version of it. If the Desktop Printer Extension is not already in the Extensions folder inside your System Folder, or you have a newer version of the extension, do not install it. (Installing this extension will do nothing on computers that are not already using it, but it will occupy a small amount of memory.) Use the Get Info command in the Finder to view the version of the extension if you are not sure what it is.

To install the extension:

1. Open the Apple Extras folder on the Updater disk.
2. Drag the Desktop Printer Extension icon to the System Folder on your hard disk.
3. Click OK each time a message appears.

Changes in Version 3.0.2

=====

Using the Lock Startup Disk Feature

A bug was inadvertently introduced in version 3.0.1 that prevents the Lock Startup Disk feature from working correctly. Though it may appear that the feature is active on those machines that are able to use it (indicated by a checkmark in the box next to the feature), it may actually not be active and users will be able to view the startup volume by booting from a floppy disk (or another bootable volume). After updating your machines to 3.0.2, you should first attempt to make sure the feature is disabled, quit the administration application, and then re-enable it. This will ensure that the latest update code is installed on your startup disk.

Note that this feature will not work on all Macintoshes. You should read the section later (Disk Security) on compatibility of this feature with your computer.

System Startup Crash While Using Open Transport

A fix was made to the At Ease Startup extension to fix a problem with a system crash that occurs on 68K machines that have Open Transport networking enabled. This crash may also show up on certain PPC machines (notably 7500s).

Fixed Possible HD Corruption on IDE Hard Disks When Using Lock Startup Vol Feature

----- This version fixes a possible hard disk corruption problem on some IDE internal drives when the "Lock startup volume" feature is activated on certain newer computers using an IDE (ATA) internal hard disk. This includes the PowerBook 190, PowerBook 2300, and PowerBook 5300 computers, but not the Quadra 630. If this occurs, the primary behavior is that the computer will display a "sad Mac" screen at reboot time.

Version 3.0.2 does not repair an already affected hard disk. If you have encountered this problem, the utility "At Ease-IDE Utility" will allow you to recover your hard disk. This utility is available on this disk. See the "At Ease-IDE Utility" Read Me for additional information.

Changes in Version 3.0.1

=====

Launching Applications from Other Applications

Normally, for security reasons, At Ease will not allow applications to start, or sublaunch, other applications. You can allow users to sublaunch applications in At Ease in one of two ways: (a) by installing the sublaunched application in the

users setup; or (b) by using the Application Preferences command (in the Options menu) in At Ease Setup and putting an X in the box labeled Can be launched by other applications for each sublaunched application. Unfortunately, this process can be confusing.

Version 3.0.1 simplifies this procedure by providing one way to allow sublaunching for all applications. The User Settings dialog box (which you open by choosing User Settings in the Security menu) now contains a checkbox labeled Always permit sublaunches. When this checkbox is selected, At Ease always allows applications to start other applications. (This setting takes precedence over any setting in the Application Preferences dialog box.)

By checking this option, an administrator does not have to worry about selecting individual applications for sublaunching. The checkbox can be best thought of as a compatibility mode feature that allows many applications to work better.

Log-in Procedure

To improve the log-in speed, At Ease no longer saves the panel or page information. Thus, when a user logs back into the panels environment, she or he will always be brought to the first page of the brown panel.

At Ease Setup Changes

When At Ease Setup starts up, it now checks the internal databases. This check can take a few seconds (when no users are logged in to the At Ease server) to almost a minute (on slow networks, when users are already logged into At Ease). A message advises you that this check is taking place.

Clarifications

=====

Using Kid Pix Studio (Correction to Read Me for At Ease 3.0)

In the Read Me file for At Ease 3.0, the section titled At Ease for Workgroups 3.0 and Kid Pix Studio explains how to use At Ease 3.0 with Kid Pix Studio. The information for setting up subprograms with the Application Preferences command contains an error for the file KPS 5. The file creator for KPS 5 should be Kid5, not Kid4. Note: The i character is generated by first typing Option-i, then immediately typing i.

CD-ROMs and At Ease

An administrator can selectively allow CD-ROMs to be used on a workstation. This feature applies only to discs that can be loaded into the CD-ROM drive of the users computer. It does not apply to discs in CD-ROM drives that are connected to an AppleShare file server. These drive appear to At Ease as AppleShare volumes, not CD-ROM drives.

Documents Created by Approved Applications

Documents that are available to users may be opened if the application that created the document is on the approved list in At Ease. The software creates this list by searching locations to which the users of a setup have access,

including the setup folder, the Apple Menu Items folder, the Control Panels folder, and the Startup Items folder. Folders are searched only if the users of the setup have access to them.

If any documents (or stationery pads) exist in those locations, then the program assumes that the application that created them is also approved. For example, if the Apple Menu Items folder contains a SimpleText stationery pad, and users of that setup have access to other items in the Apple menu, those users will be able to open any SimpleText documents, no matter where the documents are located. This is true for both panels and for the restricted Finder.

Server Mounting in At Ease

The administrator can select whether users of a particular setup can either (a) start up with the last server volumes used or (b) use the Choosers marked startup volumes instead. The program permits only one of these options for a given setup.

This feature can be set in At Ease Setup (Workgroups) by selecting a setup and then putting an X in the box labeled Always remember the user's last-used AppleShare logins. When the checkbox is selected, any AppleShare volumes mounted at log-out will be remembered by At Ease and remounted the next time the user logs in. When the checkbox is not selected, any server volumes that were set in the Chooser to connect at startup will mount with the same privileges as were set with the Chooser. Because this feature operates on a user-by-user basis, the setting must always be the same for any user who belongs to multiple setups.

If a server has volumes (such as a CD-ROM drive) to which you want users to have access when they log in, you should leave the remember checkbox unselected and use the Chooser to set up the volumes to be mounted on each workstation. You must do this on each computer, because the AppleShare information is stored in the system folder of the workstation and not on the server volume.

Disk Security

The disk security in At Ease prevents users from starting up a workstation from a floppy disk and accessing the startup hard disk. This feature was introduced in At Ease 2.0. In Version 3.0, it is a box labeled Lock Startup Volume in the User Settings dialog box.

If At Ease detects that the security option cannot be used on a workstation, it dims the menu command. The two primary reasons why the Lock Startup Volume option cannot be used are:

Unknown hard disk driver

If you have reformatted your startup disk with a non-Apple hard disk driver, the disk security option may not work with that driver. If the Lock Startup Volume checkbox is dimmed, please contact the driver software manufacturer to see if that disk driver is compatible with this At Ease feature.

Non-partitioned IDE drives

Some Macintosh computer models use a hard disk drive mechanism called IDE (or ATA) for the startup disk. (Computers that use this drive type include the Power Macintosh 5200, 5300, and 6200, and the Macintosh PowerBook models 150, 190, and 5300.)

The security in At Ease requires that the startup hard disk drives are partitioned. All SCSI hard drives are partitioned at the factory, and in the future, the IDE drives will be partitioned. But for current Macintosh models with IDE drives that are not partitioned, the disk security will work only if the IDE drive is reformatted using a partitioned driver. One program that can partition these drives is Drive7, from Casa Blanca Works. (The IDE hard drive must be reformatted in order to partition it. You cannot just update the driver on the disk.)

At Ease and File Sharing

Turning on file sharing on a computer using At Ease 3.0 or 3.0.1 is not recommended. At Ease attempts to turn off file sharing when a restricted Finder user starts up. You should be sure that file sharing is turned off (in the Sharing Setup control panel).

Maximum Connected Users on an At Ease Server

Because At Ease can open up to four files on the server for each machine that is in the login screen, it is possible that some versions of AppleShare will not allow as many machines to connect as it may indicate in the AppleShare Admin File Server Preferences dialog. Version 4.2 of AppleShare should eliminate this restriction.

Bypassing At Ease at Startup on Certain Power Macintoshes

Certain newer Macintoshes that use System 7.5.2 may allow the user to bypass At Ease by holding down the shift key at startup time. This problem has been fixed in System 7.5.3, but an easy workaround for the time being is to turn on the "Don't allow shift key at startup to disable extensions" checkbox in the setup application. You may need to do this on each machine that is having the problem.

At Ease and RAM Doubler

RAM Doubler version 1.6 is not compatible with At Ease 3.0.1. Users may experience crashes when launching applications from At Ease if RAM Doubler is installed. Apple recommends customers contact Connectix Corporation to determine if an updated version is available. For more information, contact Connectix at (800) 950-5880 or (415) 571-5100.

Major Problems Corrected In Version 3.0.1

Users Visible After Update from Version 2.x

When users update from version 2.x to version 3.0, sometimes users that were already in At Ease did not show up in the setup application. The resulting

display would show setups, but no users. Users should now appear after the automatic update from 2.x to this version (3.0.1).

No Report of Damaged Preferences File at Log-in

On certain network systems (especially if workstations are not turned off periodically), a message indicating that the application preferences may be damaged appeared when a workstation logged in even though other computers would be working properly. Restarting the server would usually clear up this problem. This problem has been fixed in version 3.0.1.

Faster Logging In or Out on Large Systems

In server-based At Ease labs with many installed users, workstations would take an excessively long period of time to log in or out. In version 3.0.1, the log-in and log-out time has been lessened for very large networks. Apple further recommends that you use version 4.2 (or later) of AppleShare if you are encountering problems with slow log ins or log outs.

Documents Panel Remains Visible

When a user was logged in, a message occasionally reported that the server had been disconnected. The documents panel would disappear and not reappear, even though the server volume was not actually disconnected. This problem has been corrected.

Setup Application Correctly Recognizes Setups

The problem in which the setup application interpreted one or more setups as locked (so that they could not be modified by the administrator) has been corrected.

Virex Incompatibility Corrected

The Virex application was not compatible with At Ease 3.0. If both were installed, the system would cause a crash at startup. This problem has been corrected.

Items in the Apple Menu Remain Visible

Occasionally some aliases in the Apple menu were deleted when a restricted Finder user returned to the log-in screen. This problem has been corrected.

Servers Mount Correctly

A problem that sometimes prevented server volumes selected in the Chooser from mounting when a user logged in has been corrected. (This feature only works if the users setup has the Always remember the user's last-used AppleShare logins turned off. See the users manual for instructions.)

Import Users Function Works Correctly

A number of changes were made to the import users function, including correcting

a problem that prevented cancellation of importing when many errors occurred.

Middle-Level Administration

Middle-level administrators can now add users to setups that they own.

Using AIMS on a TCP/IP Network With Windows PCs (5/96)

Revised: 5/31/96
Security: Everyone

Using AIMS on a TCP/IP Network With Windows PCs (5/96)

=====

Article Created: 31 May 1996

TOPIC -----

I am setting up an Apple Internet Mail Server (AIMS) on a company network for internal e-mail. This mail server will be the only Macintosh computer on our network, so I'll need to configure the PCs with a TCP stack. How do I do this and have the PCs use AIMS?

DISCUSSION -----

If your PC computers are using Windows, they should either have an add in, or built-in TCP stack. Your PCs will also need to have a POP3 Mail client like Eudora installed. If you are using Windows 95, you need to install the TCP stack on each of the clients. Usually the default installation does not install TCP, so you need to install it manually.

Since you want an internal e-mail system, you can use IP addresses to identify all of the computers. If you use IP addressed, you should disable DNS (domain name server) when you setup the TCP properties on the PCs. If you want to use domain names, you will need to run a DNS on one of the computers.

MacDNS, a DNS application, can be run on the same Macintosh computer as AIMS. With a DNS users can refer to others as "user@mycompany.com" as oppose to "user@192.0.0.0"

If you have trouble setting up the TCP/IP connection in Windows, please contact Microsoft for further support.

Tips

====

Improving Video Capture

You can increase the speed of video capture by taking one or more of the following actions:

- Turn off virtual memory in the Memory control panel.
- Turn off AppleTalk. (You can quickly turn AppleTalk on or off with the Control Strip, or use the Chooser instead.)
- Reduce the size of the capture window. (160x120 is the best size; also, 320x240 is good.)
- Do not run programs other than the capture application while capturing video.
- Turn off the Menubar Clock in the Date & Time control panel.
- Turn off all unnecessary extensions. Do not turn off QuickTime. (Use the Extensions Manager control panel to turn off extensions; then restart your computer.)
- Make sure that your hard disk has enough free space to record. If you notice a decline in performance, use a disk optimizer to improve your disk's efficiency.

Software for the GeoPort Adapter and Express Modem

Apple Telecom software is available on the CD that came with your computer. Apple Telecom is the software for the GeoPort Adapter for PowerPC-based computers and the Express Modem for PowerBook computers.

In the U.S. and Canada, MegaPhone is included with the Apple Telecom software. MegaPhone is a screen-based telephone application that supports the telephone capabilities of the Apple Telecom 2.x software using the GeoPort Adapter, such as dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information.

In the U.S., Canada, and Japan, Apple Telecom is also available as part of the GeoPort Adapter Kit, which can be purchased separately. The kit includes MegaPhone as well as SITcomm SE/GTA (a terminal emulation program). Apple Telecom, along with MegaPhone (but without SITcomm) is also available as a free upgrade on CompuServe, America Online, and Apple Internet sites.

If you are using a GeoPort Adapter with Apple Telecom software on any Macintosh model with a PCI expansion slot (such as the 5400, 7200, 7500, 8500, or 9500), be sure to disable LocalTalk by disconnecting any devices attached to the printer port (serial devices can remain attached).

Installing Acrobat Reader from the System Software CD

Adobe Acrobat Reader lets you view and print any Portable Document Format (PDF) file. You'll find several PDF files on your computer's hard disk and on the system software CD that came with your computer. These PDF files contain instructions for using many of the special software programs that came with your computer.

The Acrobat Reader installer file is located in the Apple Extras folder on your hard disk and on the system software CD that came with your computer. You have to run the installer file before you can use Acrobat Reader. Refer to the Installing Acrobat Reader document for installation instructions.

Using the QuickTake 150 Camera

For best results, use the QuickTake Image Access control panel to look at images in the camera and transfer them to your Macintosh. This method is faster and more reliable than using the PhotoFlash program.

Troubleshooting

=====

More troubleshooting information on the problems described below and on other topics, refer to Macintosh Guide (available in the Guide menu when the Finder is active) and the manuals that came with your computer.

Printing Problems

Your system freezes or experiences other problems when printing on a LaserWriter Select 300 or 310 printer. This problem can occur when you attempt to print and your printer is not connected properly to your computer. Trying to cancel printing in the Print Monitor will not solve the problem and may either produce a flashing error message or cause your computer's performance to slow down.

Check to make sure your printer is connected to your computer. If you see a message with a Continue button, click Continue. Normal printing is resumed.

You have trouble printing on a StyleWriter or StyleWriter II printer. Use the StyleWriter 1200 printer driver that came installed on your computer. Do not install your older StyleWriter driver; it is not compatible with PowerPC-based computers.

You have trouble printing with Apple PhotoFlash. Make sure that you have designated a printer in the Chooser. After doing so, open the File menu and choose the Print command.

You can't use the "Print Later" option with a non-networked printer. If you have the Assistant Toolbox extension installed on your computer and you want to use the "Print Later" option when printing on a non-networked printer, you must turn off the Assistant Toolbox extension and restart your computer.

To turn off the Assistant Toolbox extension:

1. Open the Apple () menu and choose Control Panels.
2. Open the Extensions Manager control panel.
3. In the list of extensions, click next to the Assistant Toolbox extension to remove the checkmark.
4. Restart your computer.

You see a low-memory warning when you print Stickies on a StyleWriter, StyleWriter II, or StyleWriter 1200 printer. This problem can occur when the amount of memory Stickies uses is set below 150K. Try increasing the amount of memory available to Stickies. For instructions on changing the memory a program uses, refer to Macintosh Guide (available from the Guide menu when the Finder is active).

Performance Problems

You see a message that not enough memory is available. This problem can occur for several reasons. For detailed tips on memory-related problems, refer to both the troubleshooting information in the manuals that came with your computer, and to the information on memory in Macintosh Guide (available in the Guide menu when the Finder is active).

If this problem occurs after you have opened the Extensions folder in the System Folder and scrolled through a long list of extensions, you can restore normal performance by restarting your computer.

Problems with Sound

When you play back sound you've recorded, you notice clicks, pops, or skips. This problem can occur if you have virtual memory turned on while you're recording sound. Turn off virtual memory before recording. For instructions on turning off virtual memory, refer to Macintosh Guide, available from the Guide menu when the Finder is active.

Adjusting the volume slider in Apple Video Player and other sound applications does not affect the volume, or it turns the volume all the way up or all the way down (allowing no in-between settings). This problem occurs on some newer models that handle sound differently from some older application programs. You can use the system sound settings to adjust the volume. Follow these steps:

1. Open the Apple () menu and choose Control Panels.
2. Open the Monitors & Sound control panel.
3. Click the Sound button.

4. Use the volume or level slider (whichever is available) to adjust the sound volume.

You're using a program that requires the Sound control panel to set sound options. Some application programs that use sound require the Sound control panel, an older control panel that has been replaced on your computer by the Monitors & Sound control panel.

You can install the Sound control panel by doing a custom installation of system software. For instructions, refer to the information on custom installation in the Troubleshooting chapter of the manual that came with your computer. When the Custom Install dialog box appears, click "Sound control panel" in the list, then click Install.

Hypercard version 2.3.3 or earlier does not record sound properly on your computer. Other sound recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within Hypercard 2.3.

Networking and File Sharing Problems

IMPORTANT For information about Open Transport, see the information on networking in Macintosh Guide and in the manual that came with your computer. Additional information about Open Transport is on your hard disk in a separate folder.

AppleShare displays incorrect information for large drives. If you use File Sharing to share a disk larger than 2 gigabytes (GB), some older computers connected to your computer may display an incorrect size for the disk in the Get Info box. (Get Info reports the disk to be 2 GB in size, even if it is larger.)

Since these older computers do not support the larger drives, they also cannot report correct information about the drives. (Computers with System 7.5 display correct information.)

You can't reconnect to a server. If you unexpectedly lose a connection to a server on which you have items in use, and then choose the server from the Recent Servers item in the Apple menu, you get a message that the disk could not be opened because you do not have enough access privileges or because the server can't be found on the network. To reconnect to the server:

1. Close any open files. If any of your files contain changes that need to be saved, use the Save As command to save them on an available disk.
2. Choose the server from the Recent Servers item in the Apple menu.
3. If necessary, replace the files on the server with the ones you saved on an available disk when the server was not available.

You see zones and/or servers listed in the Chooser, but the network cable is not connected to the computer. This problem can occur if you disconnect the network cable from the back of your computer while the Chooser is open. Be sure to shut down your computer before disconnecting a network cable.

You have problems using AppleShare Server Software version 4.1 or 4.2.

AppleShare server software versions 4.1 and 4.2 are not intended for use with PCI-based computers, such as the Power Macintosh 5400, 7200, 7500, 8500, and 9500 computers. If you attempt to use AppleShare server software version 4.1 or 4.2 with these models, you may experience problems.

Problems Using a RAM disk

You see a message that your RAM disk is unreadable. Under some circumstances you may see the following message after setting up a RAM disk:

"This disk is unreadable by this Macintosh. Do you want to initialize the disk?"
(Important: This message applies to the RAM disk, not to your hard disk, which will not be initialized.)

Decrease the size of the RAM disk. If you see the message again, decrease the size again. Continue to decrease in small amounts until the message no longer appears.

Problems with Programs Freezing or Quitting Unexpectedly

MoviePlayer quits unexpectedly. Using MoviePlayer 2.1, you can play a movie at double (2X) size. You cannot present a movie (that is, play the movie on a second monitor) at double size. Presenting a movie at 2X size results in the Movie Player quitting without warning.

Wiggleworks freezes, quits unexpectedly, or won't produce sound. Wiggleworks 1.0 requires special software, Macintalk Pro, to produce sound. The version of Macintalk Pro that comes with Wiggleworks is not compatible with your computer. After installing Wiggleworks, you need to drag a newer version of Macintalk Pro (version 1.4 or later) to the Extensions folder (inside your System Folder).

There are two ways to obtain Macintalk Pro version 1.4:

Install PlainTalk from the Apple Extras folder. PlainTalk includes Macintalk Pro version 1.4, which is placed in the Extensions folder when you install PlainTalk.

Download Macintalk Pro from Apple Computer's America Online or Internet sites. Refer to the manual that came with your computer for information about connecting to Apple's online sites.

If you are unable to obtain Macintalk Pro version 1.4, you can order it from Apple by phone. Refer to the service and support information that came with your computer for the phone number you should call.

Note: Your computer comes with Macintalk 3. Wiggleworks 1.0 does not work with Macintalk 3. To hear sound with Wiggleworks you must have Macintalk Pro version 1.4 in your Extensions folder, but it is not necessary to remove Macintalk 3.

Maple V quits unexpectedly when you change your monitor resolution. This can occur if you use the Control Strip to change the monitor resolution while the Maple V program is active. Use the Monitors & Sound control panel instead of the Control Strip to change screen resolution. For instructions on using the

Monitors & Sound control panel, refer to Macintosh Guide (available in the Guide menu when the Finder is active).

When you try to install Adobe Premiere Deluxe, the mouse freezes. This can occur if you have virtual memory turned on and AppleTalk active when you try to install Adobe Premiere Deluxe. Turn off virtual memory and make AppleTalk inactive before installing. For instructions, refer to Macintosh Guide (available from the Guide menu when the Finder is active).

This problem does not occur if you select Adobe Premiere 4.2 installation instead of Adobe Premiere Deluxe.

Problems Using Infrared Features

Farallon AirPath v1.0 and Apple IR File Exchange don't work on your computer. Also, Farallon AirDock and other infrared devices are not detected through a serial port that has been selected in the AppleTalk control panel, nor has the string "(IR)" been appended to the port name. Infrared (IR) features are not fully supported on desktop computers running system software version 7.5.3. An AirDock connected to a selected AppleTalk serial port will, in most cases, operate normally (though forwarding features are disabled). This lets you connect to the desktop system using Personal File Sharing. These problems do not occur on PowerBook computers, and will be corrected on desktop computers in a future update.

Compatibility Problems

=====

At Ease for Workgroups 3.0 and 3.0.1

In the At Ease Setup program, the "Lock startup volume" checkbox in the User Settings dialog box is dimmed and unavailable. To make the checkbox available, install the At Ease for Workgroups Updater version 3.0.2, which is in the Apple Extras folder on the system software CD that came with your computer.

If you are using a version of At Ease prior to 3.0.2, do not remove the "At Ease ATA Extension" in your Extensions folder. (This extension prevents the "Lock startup volume" checkbox from being available.) If you are using At Ease 3.0.2 or later or you are not using At Ease at all, you may remove the "At Ease ATA Extension."

For more information, refer to the SimpleText file in the the At Ease for Workgroups Updater folder in the Apple Extras folder on the system software CD that came with your computer.

Ethernet Cards

The Ethernet CS II Card requires Open Transport software. To use Open Transport, open the Network Software Selector application in the Apple Extras folder, and select Open Transport networking. Then use the AppleTalk and TCP/IP control panels to set up networking with the Ethernet CS II Card. (Do not use the Network and MacTCP control panels.)

..TIL19925-Power_Macintosh_5400-120-ReadMe_5-96_(TA35610).pdf

MacIPX is not supported currently by Open Transport and therefore does not work with the Ethernet CS II Card or with any Ethernet PCI card.

The currently shipping versions of Apple IP Gateway and AppleTalk Internet Router are not compatible with Open Transport.

Japanese and Chinese Language Kits

To use the Japanese Language Kit with your computer, you must install version 1.2 or later. In the United States, you can obtain an upgrade by calling Claris at 1-800-293-6617.

To use the Chinese Language Kit with your computer, make sure you use version 1.1.1 or later. To install the Chinese Language Kit version 1.1.1, follow these three steps:

1. Install the WorldScript Updater 1.0.
2. Install the Chinese Language Kit version 1.0 or 1.1.
3. Install the Chinese Language Kit Updater to update your software to version 1.1.1.

IMPORTANT: Be sure to follow the steps in the order shown.

QuarkXPress

To use QuarkXPress with System 7.5.3 on a PowerPC-based computer, you must upgrade to QuarkXPress version 3.32.

SAM Virus Detection

SAM (Symantec AntiVirus for Macintosh) version 4.0 does not work with System Software version 7.5.3. To use SAM, you must obtain SAM version 4.0.6 or later from Symantec Corporation.

Note: The first time you restart your computer after installing SAM, the screen may be only partially redrawn (with a rectangular area missing) after you dismiss the SAM startup message. This screen problem only occurs once after you install SAM.

STF PowerFax PE

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory lets your application use less memory.

Your computer comes with virtual memory turned off. With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide menu when the Finder is active. Click the Memory topic area, and then click "How do I use hard disk space as memory?" and "Tips for PowerPC-based computers."

For best performance, try setting virtual memory to no more than 150% of the memory (RAM) installed in your computer, or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (this is 150% of your 16 MB of RAM, and less than 50% of the available space on your hard drive).

If virtual memory is turned on and you notice performance problems (such as unusually slow computer response) when using certain application programs, you may want to turn off virtual memory.

To improve performance, you can also install more memory (RAM) in your computer. See the user's manual that came with your computer for more information.

Important Information About Document Auto-Save

=====

The Energy Saver control panel contains a feature named "Document Auto-Save." The purpose of this feature is to automatically quit all open applications during an idle or scheduled shutdown, while saving changes to any open documents in each application. Since there are literally thousands of applications available for the Macintosh (with new ones always arriving), we cannot guarantee that Document Auto-Save will be compatible with every application. This is especially true for any application that does not use standard routines to implement the alerts or dialog boxes used to save changes to new or modified documents. When Document Auto-Save is incompatible with an application, it will either not automatically quit, or it will display alerts or dialog boxes that Document Auto-Save does not recognize and therefore does not dismiss.

If you intend to turn Document Auto-Save on, we recommend that you monitor its operation during the first attempted idle or scheduled shutdown and note if any of your applications are not compatible. You can avoid problems with incompatible applications simply by making sure you leave open no documents that are new or modified before an idle or scheduled shutdown is to occur. Alternatively, you can modify the Document Auto-Save preferences in the Energy Saver control panel so the computer will sleep rather than shut down when unsaved documents are open.

For instructions for using Energy Saver & Document Auto-Save, choose Macintosh Guide from the Guide menu when the Finder is active, and choose the Energy Saving topic area.

Other Document-Saving Products

There are conflicts when non-Apple document-saving control panels or extensions are used in conjunction with Energy Saver's Document Auto-Save. Examples of such products are NowSave and SuperBoomerang. For best results, use the document-saving features of only one control panel or extension.

Self-Dismissing Dialogs

Under some rare conditions, the Energy Saver control panel may continuously dismiss dialog boxes if the Document Auto-Save feature unexpectedly fails during an idle or scheduled shutdown. (Whenever a dialog box appears, it is dismissed as if you have pressed the Return key.) To return things to normal, simply click the mouse button or press the space bar.

Important Information About Macintosh PC Exchange

=====

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with your Macintosh model. Macintosh PC Exchange provides an easier method for accessing DOS and Apple II ProDOS disks on a MacOS-based computer.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option from the DD menu.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a MacOS-based computer, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working With Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use Macintosh PC Exchange to mount the MacOS-, DOS-, or ProDOS-format partitions as individual volumes on the Macintosh desktop. If the disk contains both MacOS- and DOS-format partitions, Macintosh PC Exchange will recognize only the MacOS partition. In addition, Macintosh PC Exchange will recognize ProDOS-format partitions only on SCSI hard disks that are less than 32 megabytes.

You can use Macintosh PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use Macintosh PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a MacOS-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple

MacOS, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for Macintosh PC Exchange to recognize any SCSI removable media device, you must turn on the device and eject any cartridges before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, click the device's icon to select it and choose Put Away from the File menu. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a DOS or DOS-compatible computer, use either the disk setup and partitioning software that came with the SCSI controller card installed in your PC or the one that came with your Bernoulli or SyQuest device. (Do not use the MS-DOS FDISK command.) Also, use the MS-DOS FORMAT command to format a newly initialized removable media cartridge on a DOS or DOS-compatible personal computer (PC) before you copy DOS files onto it.

When you initialize a removable media cartridge on a DOS or DOS-compatible PC, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, Macintosh PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for Macintosh PC Exchange to recognize a SCSI hard disk drive, you must turn on the drive before you turn on your computer.

Do not install the device driver software that came with your removable media device. Instead, open the Macintosh PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your computer. Macintosh PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk connected to a DOS or DOS-compatible PC, use the MS-DOS FDISK command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS FORMAT command to format and erase the disk before you copy DOS files to a new SCSI hard disk connected to a PC.

Tips and Problems

- A "Sad Mac" icon may appear on your screen at startup if a removable media cartridge has been left in the drive. To keep this problem from occurring, manually eject removable media cartridges from their drives before you turn on your computer.
- Macintosh PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

LaserWriter: Printer Software for Windows 95 (6/96)

Article Created: 3 June 1996
Article Reviewed/Updated: 25 June 1996

TOPIC -----

This article describes the Apple LaserWriter Printer Software for Windows 95.

- Installing the Printer Driver Software
- Files Installed
- Using the Apple Color LaserWriter 12/600 PS
- Obtaining Printer Supplies for the Color LaserWriter 12/600 PS
- Apple Printer Utility 2.0.2

DISCUSSION -----

About Your Apple LaserWriter Printer Software for Windows 95

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference.

Installing the Printer Driver Software
=====

- 1) Start Windows 95.
- 2) Exit from any applications that are now running.
- 3) Insert Printer Disk 1 for Windows 95 into your floppy disk drive.
- 4) Click on the "Start" icon of the Task-Bar and select "Run...".
- 5) In the dialog that appears, type a:\setup (where a: is your floppy diskette drive indicator), and click OK. Follow the installer instructions.

Files Installed

=====

These PostScript Driver files are placed in c:\windows\system:

PSCRIPT.INI
FONTS.MFM
ICONLIB.DLL
PSCRIPT.DRV
PSCRIPT.HLP
PSMON.DLL
TESTPS.TXT

The ReadMe file, Apple Printer Utility, and required DLLs are placed by default in c:\lwutils:

README.TXT
APU.EXE
APU.HLP
IDPSVCS.DLL
SPX_WPS.DLL

Required DLLs for NetWare are placed in c:\windows\system:

NWCALLS.DLL
NWIPXSPX.DLL

During installation the Add Printer Wizard installs APPLE380.SPD and the selected PostScript Printer Description file in c:\windows\system:

APLWGRI2.PPD
APLWCOB1.PPD

For APLWCOB1.PPD file APLWCOB1.ICM is installed into c:\windows\system\color.

Using the Apple Color LaserWriter 12/600 PS

=====

NetWare Rprinter Printer Number

The printer may obtain the Rprinter Printer Number automatically.

About the Demonstration Page

When the power is turned on, the Color LaserWriter 12/600 PS automatically prints a startup page and a demonstration page. For legal and B5 paper sizes, only the startup page prints; the demonstration page is not printed. You can use the Apple Printer Utility to turn off the printing of the startup and demonstration pages.

NOTE: The startup and demonstration pages can not be turned off from a PC running Windows 95 if the Color LaserWriter 12/600 PS is connected to your PC through the parallel port. You must be connected to the printer via a network to

use this option of the Apple Printer Utility.

About the Apple Color LaserWriter 12/600 PS Status Panel

As described in the Color LaserWriter 12/600 PS manual, Appendix G, the status panel lights aid in indicating hardware service problems found during printer startup. If the Alert light is flashing and all the door lights are flashing, check all the printer doors; one of them is open. If the Paper OUT and Paper Jam lights are flashing alternately, a hardware problem has been detected. To identify the problem, notice which toner lights (C, M, Y, Bk) and how many of the maintenance lights (in the area on the right-hand side of the status panel) are on, and refer to the table below. Each area listed under "Problem" represents a general circuit area for the service technician to investigate, not necessarily the exact cause of the problem.

Begin_Table

Toner Lights On	# Consumable Lights On	Problem
C	0	I/O Controller Board
C	1	SIMM, Slot J11
C	2	SIMM, Slot J10
M	2	Hard Drive
M	3	I/O Controller ROM
Y	0	Fuser
Y	1	Oil Pump in Fuser
Y	2	Thermal Sensor in Fuser
Y	3	Paper Feed Unit
Bk	0	DC Controller
Bk	1	Power Supply
Bk	2	Toner Carousel
Bk	3	Laser/Scanner Circuit
M & Bk	0	Main Motor
M & Bk	1	Drum Motor
M & Bk	2	Laser/Scanner
C & Bk	0	Controller Fan
C & Bk	1	Fuser Fan
C & Bk	2	Main Fan

End_Table

If you have an external SCSI hard disk drive attached but do not turn it on before you turn on the printer's power, the printer may indicate a hardware failure. To correct the problem, turn the hard disk drive on and restart the printer.

Using NetWare Banner Pages

The Color LaserWriter 12/600 PS is a PostScript printer only. If you are using NetWare 4.x, use PostScript banner pages only. If you use another type of banner

page, your print job as well as the banner page will not print. Do not use banner pages at all with NetWare 3.x. If you do, neither the banner page nor your print job will print.

Printing Over Novell Networks

By default, binary PostScript sent via the Novell network is encoded in Tagged Binary Communications Protocol (TBCP). The printer's TBCP filtering mode for Novell is also on by default. If you change the Protocol Options to "None" from the Printer Control Panel's PostScript setup, you must send the following PostScript to turn off TBCP filtering for Novell on the printer:

```
%=====
% Begin PostScript Code
%
true 0 startjob
(%PrintServer%)
<</Filtering /None>> setdevparams
%
% End PostScript Code
%=====
```

If you subsequently change the Protocol Option back to "Default", you must send the following PostScript to turn on TBCP filtering for Novell on the printer:

```
%=====
% Begin PostScript Code
%
true 0 startjob
(%PrintServer%)
<</Filtering /InterpreterBased>>
setdevparams
%
% End PostScript Code
%=====
```

The Novell filtering mode cannot be changed within a PostScript job, so the above PostScript sets the filtering mode outside the job context; thus it becomes permanent. If your printer's password has been changed from the default setting, replace the "true 0 startjob" line with "true <your password> startjob".

Obtaining the Best Results for Business Graphics

To obtain the best results for business graphics, colors should be 100% saturated. For example, to print pure yellow, define yellow as 100% red and 100% green without any blue. Then print your document, ensuring the Send Full Color Data option on the Job Control tab dialog is selected.

Printing on Legal-Size Paper

In the standard memory configuration, the Color LaserWriter 12/600 PS uses a higher compression technique for legal-sized paper using only the cyan, magenta, and yellow color planes. As a result of this compression technique, very complex pages may show missing pixels in fine lines or small text, "jaggies" (edges with low-resolution appearance) and color changes. To improve the image quality of such pages, you can increase the printer's memory to 16 MB or more. With at least 16 MB of printer memory, the Color LaserWriter 12/600 PS can achieve the same quality with legal-size pages as with letter and A4 sizes using all four color planes (cyan, magenta, yellow, and black.)

Printing Images on the Color LaserWriter 12/600 PS Printer

The Color LaserWriter 12/600 PS printer's highest resolution for printing images is 150 x 150 dpi. No gain in image quality is achieved if higher resolution images are used. All other types of documents print at 600 x 600 dpi.

Avoiding Hue Shifts When Printing to File

When you save an image in an Encapsulated PostScript (EPS) file all the PostScript settings relating to the original output device in effect are saved along with the image data. When the image is printed later, the settings that were in effect may cause major hue shifts. To prevent these hue shifts save the image in TIFF format instead of EPS.

The Density Control Panel

The Color LaserWriter 12/600 PS has been adjusted at the factory to produce the best possible image quality. However, small variations exist among different printers. To make subtle changes to image quality, you can use the Density Control Panel on the back of the printer.

NOTE: If changing the settings produces inferior image quality, return to the factory settings by following these steps: Select each color using the Color Select button, then press the - or + button to move the indicator light to the center position. When the indicator is in the center, press Enter to make the setting permanent. Repeat this procedure for all four colors.

Printer's Processor Speed

In the printer manual, Appendix A contains a typographical error: the microprocessor speed is 30 MHz, not 25 MHz as printed.

Using the Color LaserWriter 12/600 PS with a Windows NT Server

Using a Windows NT Server may cause spurious job records to be entered in the printer's Job Log if the printer is busy. The jobs will have a status of "cancelled."

Obtaining Printer Supplies for the Color LaserWriter 12/600 PS

=====

To order printer supplies for the Color LaserWriter 12/600 PS direct from Apple, call 1-800-600-7805. For order numbers, see Appendix A of the printer manual.

- toner cartridges
- transparencies
- photoconductor cartridge (includes toner disposal boxes)
- fuser oil
- fuser

Instructions for replacing the fuser are in Appendix F of the printer manual.

Instructions for replacing other printer parts come in the new packages.

For the location of the nearest Apple-authorized dealer, call 1-800-538-9696, extension 525.

Apple Printer Utility 2.0.2

=====

Using the Apple Printer Utility with Other Apple Printers

You can use the Apple Printer Utility for Windows only with the Apple Color LaserWriter 12/600 PS. For other Apple printers use the LaserWriter Utility for Windows that came with the printer.

Using the Apple Printer Utility on the Parallel Port

On Windows 95 you use the Apple Printer Utility with NetWare only. If you don't have NetWare you can use the Apple Printer Utility on the parallel port from a Windows 3.1 system.

Opening Dialogs within the Apple Printer Utility

Use the check boxes to open individual dialogs within the Apple Printer Utility.

Security: Everyone

Network Server: Apple PCI Ethernet Card Install Tips (6/96)

=====

Article Created: 3 June 1996
Article Reviewed/Updated: 17 June 1996

TOPIC -----

This article describes installation tips for the Apple PCI Ethernet Card (10 MB/sec Ethernet Card-AAUI, Thin Coax, Twisted Pair).

I am installing an Apple PCI Ethernet Card (10 MB) in my Network Server 500. I am following the installation instructions for the software driver. SMIT keeps tellingme installation failed. How do I get this driver to install?

DISCUSSION -----

The manual discusses setting several settings in the SMIT screen. The driver for the PCI Ethernet card uses the driver from the 100TX card and the 100TX driver needs to be installed with the following steps. Switch the following two settings as shown:

- For the Automatically Install Requisite Software field, specify YES.
- For the Overwrite Same or New Versions field, specify NO.

Can't use colon character in Macintosh file name (6/96)

Revised: 6/4/96
Security: Everyone

Can't use colon character in Macintosh file name (6/96)

=====

Article Created: 03 June 1996

TOPIC -----

I'm trying to create a folder with a name that contains a colon, but whenever I type a colon I get a dash instead. Why is this?

DISCUSSION -----

You can not use a colon in a Macintosh file or folder name. A colon is used by the Macintosh file system to delimit the path of a file. For example, if you put a file on the desktop named "test" when using System 7 or later, the path name is "Macintosh HD:Desktop Folder:test". This assumes the hard drive is named "Macintosh HD" so the "test" is located in a directory named "Desktop Folder" which is located at the root level of "Macintosh HD".

MacDNS 1.0.3: Read Me (6/96)

Revised: 6/3/96
Security: Everyone

MacDNS 1.0.3: Read Me (6/96)

=====

Article Created: 3 June 1996

TOPIC -----

This article is the MacDNS 1.0.3 ReadMe file.

DISCUSSION -----

This Read Me document describes late-breaking information about your MacDNS software and its documentation. You may want to print this document for future reference.

Product information

MacDNS 1.0.3 fixes some problems in MacDNS 1.0.2 and earlier versions, providing improved performance and reliability. Upgrading to version 1.0.3 is recommended for all MacDNS customers.

This version of MacDNS is available under the terms of a no-fee license. The license agreement is presented when the software is run for the first time. Click the "Agree" button to accept the terms of the agreement.

MacDNS and Open Transport

Open Transport 1.1 or later is recommended for use with MacDNS and all PowerPC-based Workgroup Servers.

For Workgroup Server models 7250 and 8550, the Workgroup Server Software CD-ROM disc that came with your server contains Open Transport software version 1.1 and system software version 7.5.3.

For Workgroup Server models 6150, 8150, and 9150, the Macintosh System 7.5 Update 2.0 (which updates your system software to version 7.5.3) includes Open Transport software version 1.1. Look for information about system software updates and about the latest version of Open Transport on Apple forums and Apple Web sites on the Internet.

Changes to MacDNS

This section provides details about the changes in the 1.0.3 release of MacDNS.

- Sometimes MacDNS would stop responding to incoming requests; no further UDP notifications were received until the application was quit and relaunched. To prevent this situation and insure long-term reliability, MacDNS now performs a periodic test of its own responsiveness (approximately once a minute), closing and reopening the UDP stream on port 53 if it has become blocked. This guarantees that if the server ever gets into an unresponsive state, it will always correct itself within a minute.
- Fixed a bug which could cause a crash on older Macintosh models with "32-bit dirty" ROMs, such as the IICx, when displaying the license agreement dialog. The license text is now automatically displayed in the language appropriate for the currently active system; the popup menu of languages has been removed.
- MacDNS now automatically opens the Message Log window when it is launched for the first time.
- Fixed a bug where information about currently open windows, including the size and position of the Cached Hosts window, was not correctly saved to the preferences file.
- Fixed a bug where \$ORIGIN statements following the SOA record in an existing BIND zone file were being ignored. This could cause MacDNS to import some entries with an incorrect domain name suffix.
- Fixed a problem where "Look Up Host" occasionally did not retrieve the IP address for a host name, depending on the parent server being asked. Previously, "Look Up Host" only generated queries of type ANY and MX. It now additionally asks for an A record, if one was not returned from the ANY request.
- Fixed a problem where the "Look Up Host" status message remained "Idle..." during a lookup.
- Corrected a problem in the way parent server responsiveness was measured when more than one parent server was specified. This problem could cause significant slowdowns in overall response time under certain conditions. If "A" and "B" were specified as parent servers, and A subsequently went offline, MacDNS could continue to send queries to A first instead of B, even though B was obviously the preferred server to use.
- Fixed a bug where MacDNS could include its own IP address when generating the default list of parent servers, if the MacTCP control panel on the server machine was configured to use its own IP address as its DNS server. (It is illegal, and normally not possible, to specify your own IP address as a parent server in MacDNS, since endless request looping will occur.)
- MacDNS now prevents an alias from being entered as a mail exchanger host name. The use of alias names as mail exchangers is illegal, since it can cause mail loops.

- Fixed a cosmetic bug where the size box of a resizable window was not refreshed correctly, and added a gray background to the column header area of host list windows.
- Removed the "Are you sure you want to quit?" dialog in response to user feedback, since it prevented quitting and relaunching the server under automated script control.

LaserWriter 12/640 PS: Product Description (11/96)

Revised: 11/27/96
Security: Everyone

LaserWriter 12/640 PS: Product Description (11/96)

Article Created: 3 June 1996
Article Reviewed/Updated: 27 November 1996

TOPIC -----

This article contains the Apple LaserWriter 12/640 PS product description.

DISCUSSION -----

The Apple LaserWriter 12/640 PS is a high-quality monochrome laser printer that provides outstanding results—and offers even more impressive paper-handling flexibility, including optional duplex (double-sided) printing. It's ideal for office desktop publishing use, whether your organization is involved in business, government, or education. And its networking compatibility makes it a natural for workgroups that use multiplatform local area networks or organizationwide "intranets."

Featuring an advanced laser printer engine, the Apple LaserWriter 12/640 PS can handle up to 12 pages per minute, at an impressive 600 dots per inch. Its built-in FinePrint technology and support for PhotoGrade enable this printer to provide crisp, clear text and superior-quality gray-scale images. And the LaserWriter 12/640 PS can print on a wide range of media—from A4 paper to postcard stock, and even transparencies and labels—and on paper weights from 16 to 50 pounds.

Different organizations have different paper-handling needs— a fact that the Apple LaserWriter 12/640 PS was designed to accommodate through a number of printer options. There's a duplex-printing option, so you can get professional-looking double-sided output without resorting to a copy machine. In addition, there's a 500-sheet cassette and feeder for large jobs (or larger workgroups), envelope cassette that works with the 500-sheet feeder to handle a wide variety of envelopes (and even postcards), and a special face-up output tray (ideal for printing on transparencies, labels, postcards, envelopes, or heavier paper stocks because it reduces page curl).

Yet for all of its quality, performance, and flexibility, the LaserWriter 12/640

PS remains an economical laser printing solution—made even more affordable by this printer's outstanding networking capability, which enables flexible printer sharing on a wide variety of networks. It even comes with Adobe PostScript Level 2 and PCL 5—so no matter what type of computer and which applications you're using, if you choose the LaserWriter 12/640 PS, you and your colleagues can start printing high-quality output immediately.

Features

=====

Breakthrough print quality

- Offers 600- by 600-dpi resolution for sharp, clear printing
- Includes Apple's FinePrint and PhotoGrade* technologies for enhanced text and graphics quality
- Offers optional duplex printing for professional-looking double-sided output*
- Provides a choice of 64 scalable TrueType fonts for printing in any size and in a wide variety of styles

High performance

- Comes with 4MB of RAM, expandable to 64MB using industry-standard 72-pin SIMMs
- Prints at a fast 12 pages per minute
- Provides impressive performance through its powerful RISC processor—the 30-MHz AMD 29040

Compatibility

- Features built-in, all-ports-active LocalTalk, Ethernet, and bidirectional parallel interfaces, so it's easy to share your printer with others—including users of PCs running Windows
- Includes the Adobe PostScript Level 2 and PCL 5 page-description languages for compatibility with your applications

Convenience

- Offers easy, single-button installation of printing software and fonts
- Supports flexible paper handling with a built-in 250-sheet universal cassette and 80-sheet multipurpose tray, which can handle a variety of media types and sizes
- Works with a number of easy-to-install printer options, which can be combined in various ways to further enhance paper-handling flexibility

Note:

- * Requires at least 12MB of RAM

System Requirements

=====

- For the Mac OS, an Apple Macintosh, Power Macintosh, PowerBook, or other

..TIL19932-LaserWriter_12-640_PS-Product_Description_11-96.pdf

Mac OS-based personal computer with Macintosh system software version 7.1 or later, 8MB of RAM recommended, a CD-ROM drive (2), and a hard disk drive with 5MB of available space (for printer software and fonts)

- For Microsoft Windows 95, an IBM or IBM-compatible personal computer with an 80486 processor or later, 8MB of RAM, and a CD-ROM drive*
- For Microsoft Windows 3.1 or later (1) or Windows for Workgroups 3.11, an IBM or IBM-compatible personal computer with an 80386 processor or later, MS-DOS version 3.3 or later (version 5.0 or later recommended), 4MB of RAM, and a CD-ROM drive (2)

Notes:

- (1) This printer can also be used with a system running MS-DOS without Windows.
- (2) For systems without a CD-ROM drive, high-density 3.5-inch floppy disks containing the printer software are available on request.

LaserWriter 12/640 PS: Technical Specifications (11/96)

Article Created: 3 June 1996
Article Reviewed/Updated: 27 November 1996

TOPIC -----

This article contains the technical specifications for the LaserWriter 12/640 PS printer.

DISCUSSION -----

Technical Specifications
=====

Print Engine and Controller

- 30-MHz AMD 29040 RISC processor
- Engine life of 300,000 pages
- No monthly maximum duty cycle

Print Quality

- 600-dpi resolution
- FinePrint, Apple's resolution-enhancement technology
- PhotoGrade, Apple's graphic image-enhancement technology (requires at least 12MB of RAM) Memory
- 4MB of RAM standard (industry-standard 72-pin SIMMs)
- Expandable to 64MB with optional memory upgrades

Interfaces

- LocalTalk port
- Bidirectional parallel port
- Ethernet port (supports EtherTalk, TCP/IP, and Novell NetWare IPX protocols)

Print Speed

- 12 pages per minute maximum (actual speed varies depending on images printed and computer used)

Fonts

- 64 TrueType fonts (35 Adobe Type 1 fonts in ROM)

Languages Supported

- Adobe PostScript Level 2
- PCL 5

Paper-handling Capabilities

- 250-sheet built-in universal cassette
- 80-sheet multipurpose tray

Paper-handling Options

- Duplex-printing unit (requires at least 12MB of RAM)
- 500-sheet cassette and feeder
- Envelope cassette (requires 500-sheet cassette and feeder)
- Face-up output tray

Print Materials

- 16- to 50-lb. weight
- Paper: U.S. letter, U.S. legal, A4, A5, B5, C5, executive, Com-10, Monarch, DL, and postcard
- Most letterhead and colored stock, labels, and envelopes
- Medium-weight photocopier transparencies

Power Requirements

- U.S./Japan: 104 to 126 V, 58 to 62 Hz
- Europe/Australia: 198 to 264 V, 48 to 63 Hz

Power Consumption

- Continuous 12 ppm mode: 267 W average
- Standby mode: 15 W average

Environmental Requirements

- Temperature: 50 to 90 deg. F (10 to 32 deg. C)
- Humidity: 15% to 80% noncondensing
- Toner cartridge transit environment: 32 to 95 deg. F (0 to 35 deg. C)

Size and Weight

- Height: 9.25 in. (23.5 cm)
- Width: 15.94 in. (40.5 cm)

- Depth: 16.65 in. (42.3 cm)
- Weight: 26.5 lb. (12.0 kg)

System Requirements

=====

- For the Mac OS, an Apple Macintosh, Power Macintosh, PowerBook, or other Mac OS-based personal computer with Macintosh system software version 7.1 or later, 8MB of RAM recommended, a CD-ROM drive (2), and a hard disk drive with 5MB of available space (for printer software and fonts)
- For Microsoft Windows 95, an IBM or IBM-compatible personal computer with an 80486 processor or later, 8MB of RAM, and a CD-ROM drive*
- For Microsoft Windows 3.1 or later (1) or Windows for Workgroups 3.11, an IBM or IBM-compatible personal computer with an 80386 processor or later, MS-DOS version 3.3 or later (version 5.0 or later recommended), 4MB of RAM, and a CD-ROM drive (2)

Notes:

- (1) This printer can also be used with a system running MS-DOS without Windows.
- (2) For systems without a CD-ROM drive, high-density 3.5-inch floppy disks containing the printer software are available on request.

System 7.5.3: Revision 2 or Updated to Revision 2 (6/96)

Revised: 6/6/96
Security: Everyone

System 7.5.3: Revision 2 or Updated to Revision 2 (6/96)

=====

Article Created: 03 June 1996
Article Reviewed/Updated: 6 June 1996

TOPIC -----

I have a Power Macintosh 5400/120 computer, which came pre-installed with System 7.5.3. However, the About Box states that it is System 7.5.3, Revision 2. I have another computer with System 7.5.3 installed on it, but it does not mention Revision 2. What is Revision 2?

DISCUSSION -----

System 7.5.3 Revision 2 is a set of system software enhancements that improves the reliability and performance for the certain Macintosh computers.

Computers that include System 7.5.3 Revision 2 pre-installed will display System 7.5.3 Revision 2 in the About Box. However, if customers install Revision 2 over System 7.5.3, the About Box will display System 7.5.3, Updated to Revision 2.

This distinction in the About Box between Revision 2 and Updated to Revision 2 is to help determine whether System 7.5.3 Revision 2 pre-installed or updated on the computer.

Additional information about System 7.5.3 Revision 2 is available in the Tech Info Library articles, "Mac OS 7.5.3 Revision 2: Overview & Installation" and "Mac OS 7.5.3 Revision 2: Fixes, Updates, Changes".

QuickTime Conferencing: Firewall Issues (5/96)

Revised: 6/3/96
Security: Everyone

QuickTime Conferencing: Firewall Issues (5/96)

=====

Article Created: 3 June 1996

TOPIC -----

We have a firewall on our large campus network. QuickTime Conferencing (QTC) works fine inside the firewall, but when trying to go through it, the TCP/IP port appears to be selected at random. Is there a way to specify the port so we can configure the firewall to let QTC work?

DISCUSSION -----

QTC will not work across firewalls, but the router can be reconfigured with the proper "well known port number" 458 (Conference) & 545 (Broadcast) to accommodate QTC packets. Unsecured range is 6000-6255, but it may change.

System 7.5.3 Rev 2: "Important SW Updates" Isn't Included (6/96)

=====

Article Created: 3 June 1996
Article Reviewed/Updated: 6 June 1996

TOPIC -----

I have a PCI-based Power Macintosh computer, which came pre-installed with System 7.5.3. I'm planning on installing System 7.5.3, Revision 2, but I need to know if the software in the Important Software Updates folder is included with this updater.

DISCUSSION -----

No, System 7.5.3, Revision 2 does not provide the Drive Setup update, AppleGuide update, and Ethernet Compatibility extension included in the Important Software Updates folder on PCI-based Power Macintosh computer with System 7.5.3 pre-installed. These updates are considered to be part of System 7.5.3 for these computers and must be installed in addition to System 7.5.3, Revision 2.

7.5.1 WorldScript Installer: Read Me (6/96)

Revised: 6/3/96
Security: Everyone

7.5.1 WorldScript Installer: Read Me (6/96)

=====

Article Created: 03 June 1996

TOPIC -----

This article contains the ReadMe file for the 7.5.1 WorldScript Installer.

DISCUSSION -----

7.5.1 WorldScript Installer
=====

Who Should Install WorldScript?

This installer will install files needed by WorldScript technology for users running Mac OS 7.5 and above. Users of the Japanese and Chinese Language Kits or applications which depend on WorldScript technology should install these pieces as they improve the stability and performance of your system. QuickDraw GX and Power Macintosh users should upgrade to these pieces as they provide important improvements over previous versions.

Using the WorldScript Installer

The Easy Install option of the WorldScript Installer updates your existing WorldScript files. If you want to install additional files, you can use the Custom Install option of the Installer.

1. To open the WorldScript Installer, double-click the Installer icon on the disk you received with your WorldScript update package.
2. To update existing WorldScript files on your startup hard disk, click Install.

To install additional files, choose Custom Install from the pop-up menu, then click to put an X in the box next to each item you want to install. When you're finished choosing items, click Install.

The files are installed on your hard disk. You may be prompted to restart your computer after installation.

About the WorldScript Installer

The WorldScript Installer installs the following files:

WorldScript I (version 7.5.2) used for complex one-byte processing of languages such as Arabic and Hebrew,

WorldScript II (version 7.5.1) used for two-byte processing of languages such as Chinese, Japanese, and Korean,

InputBackSupport (version 7.5.3) provides support for two-byte fonts; automatically installed with WorldScript II.

Apple Internet Mail Server and Novell (5/96)

Revised: 6/4/96
Security: Everyone

Apple Internet Mail Server and Novell (5/96)

=====

Article Created: 03 June 1996

TOPIC -----

I have an Ethernet network of Macintosh computers and we use a Apple Internet Mail Server (AIMS) for mail. I want to connect our small Novell Network so the PC users can use the AIMS for mail also. I found POPMAIL.exe on the net; now how do I connect the networks?

DISCUSSION -----

If your PC's are running Windows 95, it supports multiple protocols, and you can setup a TCP stack to run along side the IPX stack. Then you need a properly configured POP/SMTP e-mail client like Eudora for example.

You can connect different platforms together using Ethernet. The Macintosh and PC computers will not see each other because they are running different protocols, but with software like AppleShare Client for Windows by Apple Computer, Personal MacLan Connect by Miramar Software, or COPS Talk by COPS Inc. will let PC and Macintosh computers share files.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

QuickTime Conferencing: ISDN H.320 Card Installation (6/96)

Revised: 6/10/96
Security: Everyone

QuickTime Conferencing: ISDN H.320 Card Installation (6/96)

=====

Article Created: 10 June 1996

TOPIC -----

This article contains instructions for installing the QuickTime Conferencing (QTC) ISDN Kit into your Macintosh computer. The QTC ISDN kit can be installed into a Macintosh 7100/66AV, 7100/80AV, 8100/80AV, 8100/100AV, or other 71XX or 81XX computers that have an Apple AV card installed. You need at least 16 MB of physical RAM and need to be running System 7.5 or later version of the Mac OS. Additionally, you will need the QuickTime Conferencing software, (either came with your QuickTime Conferencing 100 Camera or can be purchased on-line at <http://quicktime.apple.com>) an NT-1, (NOT INCLUDED IN YOUR ISDN KIT) and an ISDN line with a S-interface.

NOTE:

These steps are for the NuBus ISDN Kit only, NO PCI solution currently. The ISDN H.320 card is not compatible with the Macintosh Quadra 840AV computer.

DISCUSSION -----

Instructions for Card Installation
=====

Step 1

Power off your Macintosh computer.

Step 2

Disconnect all cables going to the computer.

Step 3

Remove the case of your Macintosh computer so you have access to the NuBus slots.

Step 4

Ground yourself with an anti-static wrist strap, or touch the exposed metal of the power supply.

Step 5

Remove any NuBus card supports.

Step 6

Remove one of the NuBus slot covers.

Step 7

Install the H.320 card into the NuBus slot where you removed the slot cover.

Step 8

Make sure the card is firmly seated in the NuBus slot.

Step 9

Install any Nubus supports that were previously removed

Step 10

Connect the ribbon cable on the H.320 card to the DAC connector on the AV card. The DAV cable will then plug into the DAV connector on the logic board.

Step 11

Replace the computer case.

Step 12

Reconnect all cables going to the computer.

Step 13

Power on the computer.

Connecting Your Computer to the NT-1 and Wall Jack

=====

Step 1

Get your NT-1 (NOT included in the Apple QTC ISDN kit) out and verify that it came with a power adaptor and either an RJ-11 or RJ-45 cable.

Step 2

Plug the power adaptor into the wall, then plug the other end into the NT-1.

Step 3

Take the cable that came with the NT-1 and plug one end into your ISDN wall jack, and then plug the other end into the 'U Loop Back' jack on the NT-1.

Step 4

Take the cable that came with your QTC ISDN Kit and plug one end into the S/T&U jack on the NT-1 and plug the other end into the RJ-45 jack on the H.320 card you installed in your computer.

Step 5

Disregard the state of the NT-1 lights until you have fully installed all applicable software, restarted the computer, and actually set up the software

Instructions for Camera Installation

=====

If you have the Apple QuickTime Conferencing 100 camera, and a Power Macintosh AV, use the hydra cable (S-video on one end, Composite [RCA] and 12 Volt power on the other end) that came with the camera.

How to Connect the Video Cable

Step 1

Connect the S-video end to the VIDEO-IN port on the AV card (the IN port is the one furthest away from the NuBus connector).

Step 2

Take the other end of the cable and connect the composite end to the RCA jack on the back of the camera.

Step 3

Plug the power end to the power jack on the back of the camera.

Step D

Open the camera shutter (slide knob on side) to expose the lens. A green light indicates you have power.

Other Video Cameras

You can use another camera as long as you can plug the camera into the S-video port of a Power Macintosh AV computer.

You cannot use a camera, such as Connectix's QuickCam, which uses the serial port.

Handset Installation =====

Your QTC ISDN Kit comes with a telephone handset. This handset is useful to use when you either need to have a more private conversation, or when ambient background noise is at a level that interferes with your conference. To connect the handset, simply plug the cable into the RJ-11 port on the RJ-11 jack on the H.320 card.

Software Installation =====

Step 1 -----

Install the Network Software Installer (NSI) 1.5 or later

Step 2 -----

Install QuickTime Conferencing (QTC) Software 1.0.2 or later

Step 3 -----

Install the H.320/ISDN software 1.0.5 or later

Step 4 -----

Restart your Macintosh computer

System 7.5.3 Revision 2: Change in About This Macintosh (6/96)

Revised: 6/6/96
Security: Everyone

System 7.5.3 Revision 2: Change in About This Macintosh (6/96)

Article Created: 4 June 1996
Article Reviewed/Updated: 6 June 1996

TOPIC -----

This article describes the changes which occur in About This Macintosh command under the Apple menu.

DISCUSSION -----

After installing the update on any computer, the version of Mac OS shown in About this Macintosh command in the Apple menu will remain the same, that is, System Software 7.5.3.

After installing Macintosh System 7.5.3 Revision 2 on a Macintosh running System 7.5.3, the second line in About this Macintosh will read Updated to Revision 2. After installing on an PowerBook with System 7.5.2 and Enabler 1.2, the second line will read System Enabler 1.2.4

Since this update will be incorporated into the reference release of System 7.5.3 there is no need to install the update over it. The first line of About this Macintosh for systems running Unity will be System Software 7.5.3. The second line will be Revision 2.

Below is a summary of About This Macintosh Changes:

- PowerBook computers with System 7.5.2 and Enabler 1.2, the second line changes from "Enabler 1.2.1" to "System Enabler 1.2.4"
- Macintosh computers with System 7.5 Update 2.0, the second line changes from "System 7.5 Update 2.0" to "Updated to Revision 2"
- Macintosh computers shipped with System 7.5.3, the second line changes from having nothing to "Updated to Revision 2"

Article Change History:

06 Jun 1996 - Changed distribution at product introduction.

Macintosh System 7.5.3 Revision 2: FAQ (1/97)

Revised: 1/17/97
Security: Everyone

Macintosh System 7.5.3 Revision 2: FAQ (1/97)

Article Created: 4 June 1996
Article Reviewed/Updated: 17 January 1997

TOPIC -----

This article lists the most frequently asked questions (FAQ) and answers about Macintosh System 7.5.3 Revision 2. This FAQ contains the following questions:

- 1) What is System 7.5.3 Revision 2?
- 2) When will it be available?
- 3) Why is it called 'Revision 2'?
- 4) Do I still need to install System 7.5 Update 2.0?
- 5) Does Macintosh System 7.5.3 Revision 2 contain the 'Important Software Updates' included with PCI Power Macintosh systems?
- 6) Who should install System 7.5.3 Revision 2?
- 7) What bug fixes are provided by Macintosh System 7.5.3 Revision 2?

DISCUSSION -----

- 1) Question: What is System 7.5.3 Revision 2?

Answer: System 7.5.3 Revision 2 is a set of system software enhancements that improves the reliability and performance for the computers mentioned in a later question. The objective of this update is to quickly respond to bugs and deliver them on one disk, small enough where most people will want to obtain it electronically (through the Internet or on on-line services). The fixes it provides will be incorporated into an upcoming reference release of System 7.5.3. This update is the first of a series of rapid response updates for System 7.5.x that will be released prior to Mac OS 8.

- 2) Question: When will it be available?

Answer: Apple announced Macintosh System 7.5.3 Revision 2 on June 7, 1996. It is available online via the following Apple Internet sites:

Worldwide Web: <<http://www.info.apple.com/swupdates>>
ftp: <<ftp://ftp.info.apple.com>>

and Apple Computer Higher Education gopher server at info.hed.apple.com.

The update also will be posted on several online services including:

America Online - keyword: applecomputer
CompuServe - GO APLSUP

Customers who do not have access to an online service or the Internet can order the update on two floppy disks in the U.S. for a \$13 shipping and handling fee. The number to call in the United States to order the update is 1-800-293-6617, ext. 1198. The number to call in Canada to order the update is 1-800-361-6075. The update will also be incorporated in the upcoming reference release of Mac OS 7.5.3 (Unity).

3) Question: Why is it called 'Revision 2'?

Answer: Apple has decided to call this product System 7.5.3 Revision 2 and not use the term "update" for two reasons:

- Revision 2 will provide improvements only for specific computers running the current system software version, which is different from all other updates Apple has released in the past.
- In addition, Apple wanted to avoid confusion with other current system software update type of products from Apple.

Apple selected the "2" in "Revision 2" since it already has released two minor versions of System 7.5 version 7.5.3. After installing System 7.5.3 Revision 2, all systems running System 7.5 version 7.5.3 will have all of the most current system improvements.

4) Question: Do I still need to install System 7.5 Update 2.0?

Answer: Apple released System 7.5 Update 2.0 several months ago, and still is recommending that customers using pre-7.5.3 versions of System 7.5 install it if they have not already. In addition, if your Power Macintosh came with System 7.5.3 pre-installed on it, and the About This Macintosh dialog does NOT read System 7.5.3 Rev 2, you should install the System 7.5.3 Update 2.0 software. You cannot skip the System 7.5 Update 2.0 and just install System 7.5.3 Revision 2 since System 7.5 Update 2.0 and System 7.5.3 Revision 2 do NOT contain all of the same fixes. So, if your computer requires System 7.5.3 Revision 2, then you should first install System 7.5 Update 2.0 and then install System 7.5.3 Revision 2, regardless which computer you have. After installing the above, you can then install System 7.5.5 Update for the latest version of System 7.5.

5) Question: Does Macintosh System 7.5.3 Revision 2 contain the 'Important Software Updates' included with PCI Power Macintosh systems?

Answer: No. You should install these in addition to the Macintosh System 7.5.3 Revision 2 update.

6) Question: Who should install System 7.5.3 Revision 2?

Answer: Apple is recommending that only customers with specific system software and Macintosh computers update their systems with System 7.5.3 Revision 2. There is no benefit for other customers.

The only systems which will benefit from System 7.5.3 Revision 2 are as follows:

- All PowerBook systems using Connectix RAM Doubler
- All PowerBook 5300 and PowerBook Duo 2300 systems
- All PowerBook 200 or 500 Series systems which have been upgraded with the Macintosh PowerBook Processor Card Upgrade Kit with PowerPC (or upgraded with similar third party products).
- All Macintosh 7200, 7500, 7600, 8500, and 9500 systems

You should install System 7.5.3 Revision 2 only if you have a computer with System 7.5.3 installed or a PowerBook with System 7.5.2, PowerBook Enabler 1.2 or later installed. To find out what system software version your computer is using, follow these steps:

Step 1

Make sure you are in the Finder.

Step 2

Choose About This Macintosh from the Apple menu. The system software information is in the About This Macintosh window.

7) Question: What bug fixes are provided by Macintosh System 7.5.3 Revision 2?

Answer: When you install System 7.5.3 Revision 2, you get the following enhancements:

- Better reliability for PowerBooks using RAM Doubler. If you have a PowerBook using System Software 7.5.3, and use RAM Doubler (version 1.6.1 or earlier), you may have experienced a problem when waking your PowerBook from sleep. This software fixes this problem.
- Overall performance enhancements for PowerBook 2300 computers and PowerBook 500 or Duo series computers with the PowerPC Upgrade Card installed.
- Improved reliability when using PC-formatted floppy disks with a PowerBook 500 series computers with the PowerPC Upgrade Card installed. If you have a PowerBook 500 series computer with the PowerPC Upgrade Card installed,

PC-formatted floppy disks that were formatted on your computer may be unreadable in DOS or Windows computers. This software fixes this problem.

- Improved reliability on PCI-based computers (Macintosh 7200, 7500, 7600, 8500, and 9500 computers) and PowerBook 5300 computers, PowerBook 2300 computers, and PowerBook 500 or Duo series computers with the PowerPC Upgrade Card installed.

- Improved reliability when copying files to a 1 gigabyte hard disk. If you have a PCI-based computer with a 1 gigabyte drive, this software helps avoid problems when copying files to the hard disk.

- Improved reliability when using the Startup Disk control panel. In rare instances, when you turn on a PCI-based Power Macintosh computer it may not start up from the disk selected in the Startup Disk control panel. This software fixes this problem.

System 7.5.1: Desktop Files and Folders (6/96)

Revised: 6/4/96
Security: Everyone

System 7.5.1: Desktop Files and Folders (6/96)

=====

Article Created: 04 June 1996

TOPIC -----

This article describes changes in the way System 7.5.1 and higher address files and folders named "desktop."

DISCUSSION -----

System 7.5.1 and later will not rebuild the desktop if a folder named desktop is saved to the root level of the hard disk.

However, a file named "Desktop" at the root level of the hard disk will still cause the system to rebuild the desktop once. After the system rebuilds the desktop, the system will make the "Desktop" file invisible and transform the file into an ordinary System 6.0.X Desktop file. As such, it will no longer cause desktop rebuilds.

Apple Game Sprockets (6/96)

Revised: 6/4/96
Security: Everyone

Apple Game Sprockets (6/96)

Article Created: 04 June 1996

TOPIC -----

This article describes the Apple Game Sprockets.

DISCUSSION -----

Apple Game Sprockets is a software development kit (SDK) designed to make life easier for game developers. With it, developers will be able to create advanced multimedia and Internet-enabled games for Mac OS-based computers. It will enable all Mac OS-compatible games to feature real-time 3D graphics, 3D sound, Internet support, speech recognition, and input device/monitor control.

Available royalty-free to all developers, Game Sprockets profoundly simplifies the creation of Apple Macintosh entertainment software. Game Sprockets includes the final release of QuickDraw 3D RAVE (Rendering Acceleration Virtual Engine), a multi-platform technology that enables game developers to incorporate plug-and-play 3D acceleration hardware.

Apple Game Sprockets, named to reflect its extensible nature, is a set of application programming interfaces (APIs) designed to work seamlessly with other Apple multimedia technologies such as QuickTime, QuickTime VR, QuickTime Conferencing, and QuickDraw 3D. Developers can "mix-and-match" individual sprockets to enhance and complement the existing features of their title.

Using Apple Game Sprockets, a typical "twitch" game could take on new realism and excitement with the addition of real-time 3D graphics and 3D stereo sound. A new interface makes it easy for games to implement advanced joystick features. If desired, this game might also include speech recognition, multi-player contests across the Internet, videoconferencing, and animation. Best of all, these games can be created and enjoyed on any PowerPC-based Macintosh computer.

Apple has established a World Wide Web site to provide developers with quick releases and updates of these new technologies. The Web site is at <http://www.dev.apple.com/games/>.

The current Apple Game Sprockets SDK includes:

- NetSprocket - Internet connectivity and multi-player gaming API
- SoundSprocket - 3D sound and Sound Manager API
- SpeechSprocket - speech recognition API
- InputSprocket - digital joystick control and input device API
- DrawSprocket - multiple buffering/display control API
- QuickDraw 3D RAVE - fast, multi-platform 3D graphics API

Technical Details

NetSprocket

NetSprocket provides standard, customizable user interface dialogs for configuration, log-in, and hosting a game across the network. A simple set of calls allows messages to be singlecast, multicast or broadcast to other machines within the game. A theoretical maximum of 2 billion users can simultaneously use NetSprocket across a broadband connection.

NetSprocket also provides transparent access to Internet-oriented gameplay and multi-player gaming. This API uses Open Transport for TCP/IP, AppleTalk (with support for LocalTalk, EtherTalk or TokenTalk) and modem communication access. By utilizing a client/server topology, it is possible for gamers to use multiple protocols in a single session and with minimal overhead (a total of 28 bytes are used per player for the message header). NetSprocket also support the creation of groups for broadcast of data to specific users across the network.

SoundSprocket

SoundSprocket incorporates a standardized API for accessing both traditional sound functions as well as new 3D sound technologies developed by Apple. For 3D sound, the listener and each sound channel are given specific positions and velocity vectors in a virtual audio space. These positions are changed during game play, along with the sounds themselves, to give the impression of spatiality and movement.

The signal processing, taking advantage of the capabilities of the PowerPC microprocessor, simulates Doppler Effect, distance attenuation, environmental reverberation and spatial positioning. The 3D effect may be effectively presented over speakers or headphones -- it is also fully integrated with the camera position used in QuickDraw 3D, which enables sound to "follow" the player in 3D space.

InputSprocket

InputSprocket provides a compact API through which games can communicate with drivers for analog or digital joysticks and other game oriented input devices in a plug and play fashion. It also provides user interface elements that allow

player override of the default control options through specified dialog boxes. Mouse and keyboard support are also enabled, as are multiple input device support.

DrawSprocket

DrawSprocket allows developers to easily utilize multiple (double or triple) buffering on the Macintosh for smooth display of graphic images. Multiple buffering is achieved by DrawSprocket using the best option available on the user's system -- true double buffering in hardware, page-flipping, efficient memory copies or through the traditional CopyBits function call. The game does not need to be aware of the hardware specifics to use this benefit.

DrawSprocket also enables configuration of display resolution or color depth without leaving the game environment (no need to access the sound and displays control panel) and screen sizing/blanking. A sprite engine, available through QuickTime, may also be used in tandem with DrawSprocket.

SpeechSprocket

Based on Apple's PlainTalk technology, SpeechSprocket allows developers to easily include high-quality speech recognition in their game titles.

QuickDraw 3D RAVE

Recently announced as the first component of Apple Game Sprockets, RAVE enables developers to transparently access 3D graphics accelerators for maximum speed and throughput while also providing exceptional 3D rendering speed in software. RAVE lets game developers leverage their existing rendering technologies - a key issue for vendors seeking to differentiate their content. RAVE is shipping now for Power Macintosh and Microsoft Windows 95, with a Windows NT version due in April 1996.

QuickDraw 3D: Requires SimpleText 1.3 (6/96)

Revised: 6/4/96
Security: Everyone

QuickDraw 3D: Requires SimpleText 1.3 (6/96)

=====

Article Created: 04 June 1996

TOPIC -----

I just installed QuickDraw 3D on my computer. When I try to open one of the sample files from the QuickDraw 3D folder, I get an error message that says, "SimpleText cannot display this kind of document." What can I do?

DISCUSSION -----

QuickDraw 3D requires version 1.3 or newer of SimpleText to display 3D documents. The QuickDraw 3D software includes version 1.3 or newer of SimpleText.

Be sure to remove any older versions of SimpleText or TeachText from your hard disk. This will ensure that you are opening your QuickDraw 3D documents with version 1.3 or newer of SimpleText.

At Ease for Workgroups: Volumes Dismount at Startup (6/96)

Revised: 6/4/96
Security: Everyone

At Ease for Workgroups: Volumes Dismount at Startup (6/96)

=====

Article Created: 04 June 1996

TOPIC-----

I am an At Ease for Workgroups administrator and I can not get my users' AppleShare volumes to mount at startup. I have set them up to mount at startup in the Chooser, but they never do. What is going on?

DISCUSSION-----

Most likely your problem is caused by the "Always remember the user's last-used AppleShare logins" option in At Ease Setup (Workgroups). When this setting is enabled, AppleShare volumes that are specified to mount at startup will not mount at startup.

This setting is enabled by default, so many users are not aware that it is enabled. In addition, it can only be accessed through the Security options Pane. Since the setup process does not require an administrator to change any of the Security options, users are not always aware that the option is there.

Follow these steps to disable the option.

Step 1

Launch the At Ease Setup (Workgroups) application

Step 2

Click the New User button

Step 3

Double-click the Panels icon, whether or not you intend to provide the user with Finder access, restricted Finder access, or Panels access.

Step 4

Click the Security Button (the button with the lock icon).

Step 5

Click on the "Always remember the user's last-used AppleShare logins" radio button to disable it.

Step 6

Continue with the setup. If you are setting up a user with Finder access, double-click on the Finder icon

Apple TV/FM Radio System: Description (7/96)

Revised: 7/9/96
Security: Everyone

Apple TV/FM Radio System: Description (7/96)

=====
Article Created: 4 June 1996
Article Reviewed/Updated: 9 July 1996

TOPIC -----

This article contains a description of the Apple TV/FM Radio System.

DISCUSSION -----

Overview
=====

The Apple TV/FM Radio System brings the world of electronic media to your Macintosh system.

Now you can stay current on late-breaking news, expand your horizons with instructional shows, or enjoy entertainment programs—all while you continue to work on your Macintosh. Your computer becomes an even more powerful communications tool when you save audio or video clips for use in your business, education, or personal multimedia projects.

The Apple TV/FM Radio System consists of a plug-in card with TV and FM radio tuners, plus easy-to-use control software. Connectors on the back of the tuner card let you attach cable TV or antenna feedlines. An FM antenna is included.

The TV control software combines the familiarity of standard television controls with exciting new features. Enter your own channel descriptions, set program alerts, and lock channels with password protection. Use closed captioning to watch programs without disturbing others or to monitor newscasts while you're listening to the radio. With a single click, shrink the TV window to one corner of your screen to free up space on your Macintosh desktop, expand it to full size for easy viewing from across the room, or set it to any size in between.

Switch to the FM radio application and enjoy music or talk shows. You can preset any number of stations, and for even more convenience, there are six car radio-style buttons with customizable labels for your favorite stations.

You can run the TV and FM radio applications at the same time to keep an eye on a TV program while listening to music, or to listen to the radio commentary for a TV sportscast. If you have two speakers built into or attached to your Macintosh system, you can even listen to radio and TV programs in stereo.

There's also a remote-control unit that lets you change TV and radio stations, adjust the volume, and control the CD player in your Macintosh system.

The Apple TV/FM Radio System works with the Apple Video System to help you perform powerful multimedia tasks easily. Just click to capture and save still frames, video clips, or audio. Then simply paste the saved items into presentations, reports, and letters to make them really come alive. Audio and video can be played back with any application that supports Apple's QuickTime multimedia technology.

Features

=====

Multimedia-rich

- Watch TV in a window or listen to the radio while you work
- Make your documents come alive with audio and video clips
- View up to 181 television channels
- Enjoy full FM broadcast band coverage

Easy to use

- Control programs look like familiar television and car-radio front panels
- Single-click startup for control programs
- One-button capture for images, video clips, and sound

Customizable

- Enter your own descriptions on radio buttons and TV lists
- Assign passwords to prevent children from accessing specific TV channels
- Set reminders for your favorite programs
- Resize the TV window to take up just as much or as little screen space as you want

Comprehensive

- TV and FM radio tuners
- Control software
- Handheld remote control (batteries included)
- Indoor antenna

PC Compatibility Card: Installing in Power Mac 5400/120 (4/97)

Revised: 4/16/97
Security: Everyone

PC Compatibility Card: Installing in Power Mac 5400/120 (4/97)

=====

Article Created: 04 June 1996
Article Reviewed/Updated: 16 April 1997

TOPIC -----

I am trying to install a 7-inch PC Compatibility card in a Power Macintosh 5400/120. None of the documentation included with either product tells me how to do this. Can I install the PC Compatibility card into the Power Macintosh 5400/120?

DISCUSSION -----

Your description indicates that you have revision A of the card (M4091LL/A). Revision B of the card (M4091LL/B) is slightly redesigned and provides full compatibility in the 5400/120; installation instructions are also included.

The revision A card can be installed in the Power Macintosh 5400/120. However, you will first have to remove the Apple External Video Connector from the logic board of the Power Macintosh 5400/120.

Install the 7-inch PC Compatibility card into the PCI slot and insert the GIMO card (the small video board that's connected to the DOS card with a ribbon connector) into the slot previously occupied by the Apple External Video Connector.

Do not use the audio cables that come with the 7-inch PC Compatibility card for installation in the Power Macintosh 5400/120. The GIMO connector card also handles the audio signal.

Macintosh Computers: What is SRS Sound? (11/96)

Revised: 11/15/96
Security: Everyone

Macintosh Computers: What is SRS Sound? (11/96)

Article Created: 4 June 1996
Article Reviewed/Updated: 15 November 1996

TOPIC -----

I have a Power Macintosh 5400/120 computer, and I've noticed that there is an option in the Sound & Monitors control panel called SRS Sound. I can only Enable or Disable it. However, I'm not really sure what SRS Sound is or what benefits it provides if I enable it.

DISCUSSION -----

SRS (Sound Retrieval System) is proprietary technology from SRS Labs, which Apple has licensed and implemented on the Power Macintosh 5400 and 6400; Macintosh Performa 6400 series; and Macintosh Performa 6360/160 computers in order to enhance the sound field of these computers.

The useability, compatibility, and performance of the computer is not affected if SRS sound is enabled or disabled. However, enabling SRS yields a more spacious stereo sound from the computer. You can try it both ways to determine which you prefer.

Stereo, Surround Sound, and SRS are all common forms of sound expansion techniques, but SRS differs primarily because it does not require special encoding or recording processes or critical listening position ("sweet spot").

Instead, SRS uses psychoacoustic (how your ears and brain interpret the sound) principles. The result is that any sound can be played back using SRS and you do not need to listen to it from a specific location to experience the effect. SRS accomplishes this by processing the ambient or reflected sounds so that they take on the audio characteristics of sounds naturally entering the ear from the side. The brain thus perceives these sounds as though they were actually coming from the sides or, in some cases, from behind the head, rather than from the two front stereo speakers.

The following chart provides an overview of the differences among stereo,

surround sound, and SRS. Additional information about SRS is available from SRS Labs web site <<http://www.srslabs.com/>>.

Begin_Table

Characteristics	Stereo	Surround Sound	SRS
Encoding	YES Using 2 or more microphones	YES Using 4 or 5 microphones or special	NO Works with any source such as mono, stereo, techniques or surround technologies
Channels	YES Left (L) & Right (R) channels.	YES 4 or 5 channels Front left chan- nel to front rt. speaker, and so on.	NO
Speakers	2	4 or 5 Surrounding listener	2
Sweet spot?	YES	YES	NO

End_Table

Note: The word 'SRS' and the SRS Symbol - (•) - are registered trademarks of SRS Labs, Inc.

Apple TV/FM Radio System: Tech Specifications (12/96)

Revised: 12/2/96
Security: Everyone

Apple TV/FM Radio System: Tech Specifications (12/96)

Article Created: 4 June 1996
Article Reviewed/Updated: 2 December 1996

TOPIC -----

This article contains a list of the technical specifications for the Apple TV/FM Radio System.

DISCUSSION -----

Technical Specifictions
=====

TV Tuner

- Up to 181 channels
- F connector, permits connection of:
 - Antenna feedline (the indoor antenna provided for the FM tuner can also pick up strong TV signals)
 - Standard or HRC (harmonically related carrier) cable TV feedline

Apple Video Player software

- Variable window size
 - Smallest (about 1/16 of screen)
 - Normal (about 1/4 of screen)
 - Largest (as much of screen as possible)
 - Any user-defined size between the smallest and largest options
- Up to 125 channel presets
 - Pop-up menu lets you assign a description (such as station name, network affiliation, or type of programming) to each channel
 - Each description can have as many as 15 characters
- Auto Tune function automatically adds all clearly received channels

to the channel list (channels can also be added and deleted manually)

- Push-button controls for video source selection
 - TV tuner
 - Composite video
 - S-video
- Sliding controls for video adjustment
 - Brightness
 - Sharpness
 - Contrast
 - Color
- Push-button controls for video standard selection
 - NTSC
 - PAL
 - SECAM
- Up/down buttons for channel selection
- Push-button controls for audio mode selection
 - Stereo
 - Mono
 - SAP (second audio program channel for descriptive video or foreign language translations)
- Sliding controls for audio adjustment
 - Volume
 - Balance
 - Treble response
 - Base response
- One-click operation for capturing still frames or video clips
- Optional movie compression
- Closed captioning/video text
 - CC 1
 - CC 2
 - Text 1
 - Text 2
- Reminders function lets you store up to 25 program reminders; on-screen alert box appears at the program start time. You can also request a notification prior to the beginning of the program. (You do not need to be running Apple Video Player for the alert box to appear.)
- Optional lockout (with password protection) on any channel
- "Hot key" capability instantly makes Apple Video Player the active program on your system

-
- Frequency range:
 - U.S.: 88.1 to 107.9 MHz
 - Europe: 88.1 to 107.9 MHz
 - Japan: 76.0 to 90.0 MHz
 - F connector, permits connection of:
 - Indoor antenna provided with system
 - Standard cable TV connector (for cable systems that offer FM stations)

Apple FM Radio Player Software

- Six preset buttons for instant access to your favorite stations
- User-selectable button labels:
 - Number (1 through 6)
 - Frequency
 - Station name
 - Description, such as type of programming (maximum 4-6 characters, depending on character width)
- Pop-up station selection menu
 - Holds any number of stations
 - Can be labeled with frequency, station name, and description (maximum 31 characters)
- Auto Add function that finds clear stations and adds them to pop-up menu
- Manual tuning functions
 - Seek up/down
 - Step up/down
- Sliding volume control
- Menu options for:
 - Signal range (Local, DX)
 - Signal strength (All Stations, All Except Weakest, Strong, Strongest Only)
 - Audio mode (Stereo, Mono)
- One-click recording
 - Adjustable compression ratio/sampling rate
 - Record time indicator

Remote Control

- Infrared link with Macintosh system
- FM radio controls
 - Channel up/down (cycles among all preset stations)
 - Audio volume up/down
 - Audio mute
- TV controls

- Channel up/down (cycles among all preset stations)
 - Audio volume up/down
 - Audio mute
 - TV window size, switches between current and largest size (or previous size, if current size is the largest)
 - TV/Macintosh (launches or quits out of the Apple Video Player application)
- CD-ROM controls
 - Audio volume up/down
 - Audio mute
 - Play/pause
 - Stop/eject
 - Previous track
 - Next track
- Macintosh controls
 - Power on/off
 - TV/Macintosh

System Requirements

=====

- Any Apple Macintosh computer with a video-in slot and a port for an internal TV tuner card (refer to the technical specifications for your Macintosh system)*
- Apple video-in card (included with Macintosh systems or can be purchased separately with the Apple Video System)
- TV antenna or cable TV feedline (with F connector)

* Macintosh 5200 and 5300 series computers may require the purchase of a new back panel (Apple part number 922-2190) replacing the original back panel (Apple part number 922-1397). Contact your Apple reseller for details.

Ordering Information

=====

Apple TV/FM Radio System

QuickTime Conferencing ISDN Kit: Description (6/96)

Revised: 6/4/96
Security: Everyone

QuickTime Conferencing ISDN Kit: Description (6/96)

Article Created: 4 June 1996

TOPIC -----

This article describes the QuickTime Conferencing ISDN Kit.

DISCUSSION -----

The Apple QuickTime Conferencing ISDN Kit lets you hold virtual meetings with people around the world -- right from your own desk -- by enabling your Macintosh computer to interoperate with other systems that support the ITU-T H.320 international standard for videoconferencing.

The kit extends the reach of your QuickTime Conferencing software to the international ISDN network. Using the kit's software and NuBus* expansion card, you can conduct point-to-point videoconferencing sessions over ISDN lines with any other H.320-compliant Macintosh computer, IBM-compatible personal computer, or room-based video conferencing system.

When you connect over ISDN with colleagues who are also using Apple videoconferencing software on Macintosh systems (or third-party software that supports QuickTime Conferencing), you can collaborate as well as videoconference, sharing an electronic "white board" that both parties can view and mark up. White board contents can be saved to the Macintosh desktop for later viewing.

The kit works with Apple's QuickTime Conferencing software (sold separately). In true Macintosh tradition, QuickTime Conferencing leverages the powerful built-in capabilities of Macintosh systems to make videoconferencing -- usually a complex, expensive technology -- easy to use and surprisingly affordable. With a Macintosh AV system and QuickTime Conferencing software, you can work with colleagues over Ethernet LANs and the Internet. Now, with the ISDN Kit, you can also connect over ISDN lines.

The QuickTime Conferencing ISDN Kit: It turns your Macintosh desktop into an ISDN-based communications and collaboration center with international

interoperability.

* PCI version scheduled for early 1996.

Features

Interoperability and flexibility

- Makes videoconferencing with almost anyone, anywhere, as easy as making a phone call
- Works with any Macintosh computer, IBM PC or compatible computer, or room-based videoconferencing system that complies with the H.320 international standard for videoconferencing
- Extends the capabilities of Apple's videoconferencing software (QuickTime Conferencing and Apple Media Conference) so that you can videoconference over ISDN networks

High quality ISDN videoconferencing

- State-of-the-art ISDN-based videoconferencing provides a high-quality, dedicated network connection and guaranteed information transfer rate of 128 Kbps
- High throughput is achieved via powerful H.320 compression/decompression software
- The worldwide ISDN communications infrastructure lets you videoconference to most locations, saving the time and costs of travel

Affordability

- Provides a single-card solution for high-performance videoconferencing
- Leverages the built-in audio and video capabilities of Macintosh AV systems
- Preserves your investment in previously purchased videoconferencing systems, ISDN lines, and personal computers
- Supports the H.320 international standard to ensure long-term interoperability

QuickTime Conferencing ISDN Kit: Technical Specifications (6/96)

=====

Article Created: 4 June 1996

TOPIC -----

This article provides the technical specifications for the QuickTime Conferencing ISDN Kit.

DISCUSSION -----

Technical Specifications

Support of these videoconferencing standards:

- ITU-T H.320 standard with H.261 video codec featuring CIF and QCIF video formats
- G.711, G.722, and G.728 audio compression standards

System requirements

- One of the following Macintosh systems*:
 - Power Macintosh 7100AV
 - Power Macintosh 8100AV
- 16MB of RAM
- System 7.5 or later (PowerTalk installation recommended; lets users call other video-conferencers via PowerTalk information cards)
- A hard disk drive
- A CD-ROM drive
- An Apple PlainTalk microphone
- A videoconferencing camera (such as the Apple QuickTime Conferencing Camera 100, included in the QuickTime Conferencing Kit)
- Apple QuickTime Conferencing system extension (included in the QuickTime Conferencing Kit)
- Apple Media Conference application (included in the QuickTime Conferencing Kit)
- An ISDN NT-1 box and power supply (may not be required in some instances; check with your ISDN provider for further information)
- An ISDN network connection with 2 B+D capability
- One of the following remote systems:

- A Macintosh computer that supports the H.320 standard
- An IBM PC or compatible computer that supports the H.320 standard
- An H.320-compliant room-based videoconferencing system
- Optional: External powered speakers

* As of September 15, 1995. Check with your Apple reseller for an up-to-date list of compatible models.

Ordering Information

QuickTime Conferencing ISDN Kit

Order No. M4585LL/A

All packages include:

- NuBus* expansion card containing:
 - H.320 software
 - ISDN hardware and jack
 - Handset interface and jack
- QuickTime Conferencing H.320 software
- Telephone handset and cord
- ISDN cable
- Installation manual

* PCI version scheduled for early 1996.

Volume and site licensing packages of Apple Media Conference software are available. Please visit the following QuickTime Web site for ordering procedures and other QuickTime Conferencing information:

<http://quicktime.apple.com>

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

H.320/ISDN Test System (6/96)

Revised: 6/5/96
Security: Everyone

H.320/ISDN Test System (6/96)

Article Created: 5 June 1996

TOPIC -----

This article describes a method to test your H.320/ISDN system using Apple Media Conferencing.

DISCUSSION -----

Question:

How can I test my H.320/ISDN system using Apple Media Conference?

Answer:

Vivo Software Inc. maintains the 'Vivo320 Test Call Center' H.320 videoconferencing system set to auto-answer 24 hours a day and 7 days a week. Their telephone number for the video conferencing is 617-492-0911. Vivo Software uses a 5ESS switch so there is only one phone number to dial. Launch Apple Media Conference then ensure these settings have been set correctly.

Begin_Table

```
Setting menu
  Preferences
    Conference
      Connection type: H.320 card
      Connect via:
        ISDN, 2 channel
      or
        ISDN, 2 channel, 56k adaptation
```

End_Table

Once the settings are correct, select "Call..." from the File menu. Remember to enter any prefixes to access an outside line (8 or 9) or any applicable long distance prefixes (1 or long distance carrier prefix).

The Tech Info Library article titled "Locating Vendor Information" can help you search for Vivo Software's address and phone number.

Apple MessagePad: Upgrading German MessagePad 120 in U.S. (6/96)

Revised: 6/5/96
Security: Everyone

Apple MessagePad: Upgrading German MessagePad 120 in U.S. (6/96)

=====

Article Created: 5 June 1996

TOPIC -----

This article describes the limitations when upgrading international versions of an Apple MessagePad in the United States.

I purchased an Apple MessagePad 120 with the ROM v 1.3 while stationed in Germany. Now that I have returned to the U.S., I would like to get the MessagePad upgraded to the 2.0 ROM. Will Apple Computer upgrade a German ROM v 1.3 at the U.S. upgrade facility?

DISCUSSION -----

The ROM is not the only difference in these units. There is also a German language set of silk-screened buttons at the bottom of the touchpad or display.

There is a limitation for the upgrade on an Apple MessagePad with an international configuration. Apple Computer will do the upgrade for the standard upgrade price plus shipping and handling. This does not include the replacement of the touchpad or display.

ARA Server, Open Transport, and LocalTalk Problem (10/96)

Revised: 10/23/96
Security: Everyone

ARA Server, Open Transport, and LocalTalk Problem (10/96)

=====

Article Created: 5 June 1996
Article Reviewed/Updated: 23 October 1996

TOPIC -----

I have a Power Macintosh 7200/90, with System 7.5.3 from Update 2.0, Open Transport 1.1, Apple Remote Access (ARA) Personal Server 2.0.1, and Global Village Platinum modem, acting as an ARA server on a LocalTalk network (with no zones) of 15 devices. Any client calling in is able to see the LocalTalk servers and printers in the Chooser, but they cannot connect to them. When connecting to a server, they get no response. When attempting to print to a printer, they get the message, "The printer is switched off or disconnected."

Another ARA Personal Server, a Macintosh Classic, on the network lets clients connect without a problem.

I have tried resolving this by doing the following to no avail:

- I tried setting ARA 2.0.1 clients to Remote Only in the Network control panel.
- I did a clean install of System 7.5.3 with Update 2.0, ARA Personal Server 2.0.1, and Global Village software on the Power Macintosh 7200/90.

What is wrong?

DISCUSSION -----

There is a known problem with ARA servers running Open Transport on a LocalTalk network. Clients will be able to see services but will be unable to connect to them as you described above.

This issue has been fixed with Open Transport 1.1.1 which is available on Apple Computer's online services. These articles can help you locate Open Transport 1.1.1:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

23 Oct 1996 - Updated with Open Transport 1.1.1 availability.

Modem: Using Register Feature as Testing Option (6/96)

=====

Article Created: 5 June 1996

TOPIC -----

This article describes how to test the modem dial out functions.

I just setup my new Performa 640. I am trying to get the modem to dial up a bulletin board but I am not sure I have the ZTerm application setup correctly or if the modem is functioning correctly. Is there an easier way to test the modem?

DISCUSSION -----

As a simple alternative test option you can use the registration feature of the modem. The registration feature is previously setup by the modem manufacturer. If you have a Global Village modem installed use the following steps:

- Open the TelePort control panel. (Use the PowerPort control panel for Global Village modems installed in PowerBook computers)
- Select the "Register..." option in the control panel.
- Follow the instructions as prompted.

AICK: What is the 800 Number for the Registration Server (6/96)

=====

Article Created: 5 June 1996

TOPIC -----

I have the Apple Internet Connection Kit (AICK), and I am trying to connect to the Internet Registration Server to decide which Internet Service Provider to choose. When I first launched the Apple Internet Dialer, the 1-800 phone number was listed, but I changed the number. I cannot find the original phone number anywhere to change it back. What is the 1-800 number for the Registration Server?

DISCUSSION -----

The telephone number in the AICK, Apple Internet Dialer for the Registration Server is 1-800-247-5067.

AICK: Setting Up with Existing Service Provider (6/96)

=====

Article Created: 5 June 1996

TOPIC -----

I have the Apple Internet Connection Kit (AICK) and I'm trying to set it up with my existing Internet service provider (ISP). When I launch the Apple Internet Dialer, it wants me to set up an account with a new service provider. How do I tell it to use my existing ISP?

DISCUSSION -----

When you first run the Apple Internet Dialer, it assumes you do not have internet access and guides you through setting up an account with a new ISP. If you already have dial-up access with an ISP, you can set it up by following these steps:

Step 1

Launch the Apple Internet Dialer application

Step 2

Choose Define Provider Information from the Provider menu.

Step 3

Enter the appropriate information for your ISP. if you do not know this information, call your ISP for the necessary information.

QuickMorph and Apple Menu Options (6/96)

=====

Article Created: 05 June 1996

TOPIC -----

I just purchased a Power Macintosh 5400/120. I installed Hypercard 2.3.3, which comes bundled with AddMotion II. Every time I try to use the QuickMorph component of the AddMotion II software, it crashes. What can I do about this?

DISCUSSION -----

Try deselecting the "Remember recently used items" checkbox in the Apple Menu Options control panel. Follow these steps to deselect this checkbox:

Step 1

Select Control Panels from the Apple Menu

Step 2

Double-click the Apple Menu Options icon.

Step 3

Click the checkbox labeled "Remember recently used items" to deselect it.

Revised: 6/5/96
Security: Everyone

Power Macintosh 5400 and Remote Control (6/96)

=====

Article Created: 05 June 1996

TOPIC -----

I just bought a Power Macintosh 5400/120 and I noticed it did not include a remote control. Was it supposed to be included? What can I do?

DISCUSSION -----

No, the remote control is not included with the Power Macintosh 5400/120. However, there are two other options available to you.

First, you can contact a local, Apple-authorized service provider and inquire about purchasing the remote control which is included with the Apple TV/Video System. The service part number is 922-0549. Service providers may not have service parts available.

You may also use any remote control which uses the Sony command set. This includes Sony TV remotes, and universal remotes which can be programmed with the Sony command set.

Drive Setup: What's New in v1.0.5 & v1.1? (6/96)

Revised: 6/5/96
Security: Everyone

Drive Setup: What's New in v1.0.5 & v1.1? (6/96)

=====

Article Created: 05 June 1996

TOPIC -----

I noticed that the Power Macintosh 5260/100 includes version 1.0.5 of Drive Setup, and the Power Macintosh 5400/120 includes version 1.1. What is different in these versions from version 1.0.4, which was included with System 7.5 Update 2.0?

DISCUSSION -----

Following are the changes made to versions from Drive Setup version 1.0.4 to 1.0.5 and 1.1:

1.0.4 -> 1.0.5

- Drive Setup 1.0.5 waits 3 seconds between calls to the Disk Init Package ensuring that volume creation dates are different. This prevents a problem with custom icons not appearing correctly on drives with multiple partitions.

1.0.5 -> 1.1

- Provides DMA support for ATA based machines.
- Fixed a problem where an ATA device's capacity was not correctly recognized.

Power Macintosh 5400/120 & Apple System Profiler 1.0.1 (6/96)

Revised: 6/5/96
Security: Everyone

Power Macintosh 5400/120 & Apple System Profiler 1.0.1 (6/96)

=====

Article Created: 05 June 1996

TOPIC -----

Was Apple System Profiler 1.0.1 revised to add support for the Power Macintosh 5400/120? I tried versions 1.0 and 1.0.1 on this computer, and the results appear to be the same.

DISCUSSION -----

Version 1.0.1 of Apple System Profiler does not include any enhancements specifically for the Power Macintosh 5400/120. If you are using version 1.0, it is not necessary to upgrade to version 1.0.1.

Article Reviewed/Updated: 03 February 1997

TOPIC -----

This article contains questions about the Repair Extension Program for Power Macintosh and Performa 5200, 5300, 6200, and 6300 computers.

Questions Answered in this Article:

=====

- 1) What is a Repair Extension Program?
- 2) What models are included in this Repair Extension Program?
- 3) Is this repair program different from the product recall I heard about recently?
- 4) Are Powerbook computers included in this program?
- 5) What is the Repair Extension Program for the Apple Power Macintosh and Performa 5200, 5300, 6200, and 6300 computers?
- 6) What are the details of the repair?
- 7) How does a customer know if his/her computer is affected by the quality issues that Apple has identified?
- 8) Where can customers obtain this diagnostic software?
- 9) How is Apple notifying customers who may be affected by these quality issues?
- 10) I have already called 1-800-SOS-APPL about getting my computer system repaired under this program. Do I need to call Apple again?

- 11) Are there any known safety issues with these products?
- 12) Is there a cost to customers?
- 13) How long will it take to get an affected computer system repaired?
- 14) Are these worldwide programs?
- 15) How does Apple define a system freeze?
- 16) What if my computer exhibits problems not caused by the components that Apple has identified?
- 17) Is Apple extending the warranty on my computer?
- 18) What are the dates of this Repair Extension Program?

DISCUSSION -----

- 1) Question: What is a Repair Extension Program?

Answer: A Repair Extension Program is one mechanism Apple uses to correct known quality issues exhibited during or after the warranty period. Quality is a top priority at Apple, and this repair program addresses certain quality issues that have surfaced with these products. Apple is implementing this repair program as part of the company's goal to provide a high level of customer satisfaction to its customers.

- 2) Question: What models are included in this Repair Extension Program?

Answer: The models included in this program are Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300. (The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.)

- 3) Question: Is this repair program different from the product recall I heard about recently?

Answer: This is the same program. In early May, we alerted Apple resellers about these Repair Extension Programs so that they would have time to prepare for customer calls and questions. Our communications to our resellers received widespread media coverage, which characterized these programs as a recall. But it's the same program; we are in the process now of letting customers know that we're ready to begin repairing affected Power Macintosh and Performa computers. This is a repair extension program, not a product recall.

- 4) Question: Are PowerBook computers included in this program?

Answer: We are activating the Power Macintosh and Performa Repair Extension

Program this week. Details about the PowerBook 5300 and 190 Repair Extension Programs will be announced to customers in about a week or so.

5) Question: What is the Repair Extension Program for the Apple Power Macintosh and Performa 5200, 5300, 6200, and 6300 computers?

Answer: The Repair Extension Program for the Apple Power Macintosh and Performa 5200, 5300, 6200, and 6300 computers addresses two potential quality issues with these models:

- * Frequent system freezes (the cursor does not move on the screen and the menu-bar clock does not advance) because of specific known components that have been identified by Apple, and/or,

- * Sudden or intermittent change in the video monitor's hue because of a particular cable.

With this Repair Extension Program, Apple has identified known hardware issues the company will repair

- * at its cost

- * for as long as Apple services these products. In the United States, that is seven years after the company stops manufacturing the products. In other countries, the time period is different.

6) Question: What are the details of the repair?

Answer: The repair procedures for this program may include:

- * Running diagnostic (5xxx-6xxx Tester) software to determine whether the computer is affected by specific known component issues on the logic board.

- * Checking the logic board and repair or replace, as appropriate.

- * As appropriate, determining whether the monitor may be affected by a sudden or intermittent change in color hue and replace a cable to correct if necessary.

7) Question: How does a customer know if his/her computer is affected by the quality issues that Apple has identified?

Answer: In each country, customers can contact their service providers or call the service number designated for their country. In the United States, customers should contact their Apple Authorized Service Provider or call 1-800-SOS-APPL to determine whether their computer may be affected by these quality issues. In addition, Apple is making simple diagnostic software widely available; this software can help identify whether a particular computer may be affected by the component issues that cause system freezes.

8) Question: Where can customers obtain this diagnostic software?

Answer: The software, 5xxx-6xxx Tester 1.0, is available in the following locations:

** America Online (keyword: applecomputer) path: software -> Macintosh -> Utilities

** CompuServe (GO APLSUP)

** The Internet:

ftp://ftp.info.apple.com/Apple.Support.Area/Apple_SW_Updates/US/Macintosh/Utilities/5xxx-6xxx_Tester_1.0.sea.hqx

9) Question: How is Apple notifying customers who may be affected by these quality issues?

Answer: Many customers heard about this program through media coverage and have already called Apple. Apple has begun to contact these customers through phone calls or letters to provide specific details on program participation and/or to schedule a repair. Information on the Repair Extension Program is also available on Apple's Web site: <<http://www.info.apple.com>>.

10) Question: I have already called 1-800-SOS-APPL about getting my computer system repaired under this program. Do I need to call Apple again?

Answer: Apple will contact you either by phone or by mail with information about the program. If for any reason you do not hear from Apple by mail or phone by June 21, 1996, please call Apple toll-free at 1-800-SOS-APPL or contact your local service provider.

11) Question: Are there any known safety issues with these products?

Answer: No.

12) Question: Is there a cost to customers?

Answer: The specific repairs outlined in this program will be at Apple's cost.

13) Question: How long will it take to get an affected computer system repaired?

Answer: Apple is committed to repairing systems as soon as possible. The length of time to get a system repaired will depend on the number of requests Apple receives, as well as parts availability.

14) Question: Are these worldwide programs?

Answer: These are worldwide programs, but it is important to note that the quality issues differ on a country-by-country basis.

15) Question: How does Apple define a system freeze?

Answer: For purposes of this Repair Extension Program, a system freeze is defined as when the cursor (arrow) does not move on the screen and the menu bar clock does not advance. The system freeze can be caused by known hardware component issues, which is what Apple is repairing under this program.

A condition defined by Apple as a system "hang", "crash", "bomb," or "lockup," is when the cursor will still move on the screen but pressing the mouse button has no effect. With this condition, users may also see an error dialog box on the screen (for example ID = Type 11). This type of error is caused by one of several possible software issues not addressed by this program.

If a customer is experiencing an issue that has not been identified by Apple as part of this program, the service provider or Apple phone-support representative (1-800-SOS-APPL) will work with the customer to determine an appropriate course of action.

16) Question: What if my computer exhibits problems not caused by the components that Apple has identified?

Answer: It is possible that system freezes or video issues can occur for reasons unrelated to the component problems described above. Any such issues would not be covered by this Repair Extension Program. If a customer is experiencing an issue that has not been identified by Apple as part of this program, the service provider or Apple phone-support representative (1-800-SOS-APPL) will work with the customer to determine an appropriate course of action.

In many cases, installation of Mac OS Version 7.5.3 may correct issues customers might be having with system freezes that are unrelated to the component issues Apple has identified. Customers who wish to install Mac OS Version 7.5.3 can obtain the software by calling 1-800-293-6617, ext. 984.

17) Question: Is Apple extending the warranty on my computer?

Answer: Under this Repair Extension Program, Apple, at its option, will repair or replace the specific components the company has identified. This program does not extend the repair of any other systems, parts, or components beyond the warranty period.

18) Question: What are the dates of this Repair Extension Program?

Answer: The Repair Extension Program starts on June 4, 1996 and will expire seven years after Apple stops manufacturing the specific Power Macintosh or Performa computers.

This article was published in the Information Alley on 6 June 1996.

TITLE

PCI Power Macintosh Computers: Upgrade Card Matrix

Article ID: 19974
Created: 6/6/96
Modified: 1/12/00

TOPIC

*** RESTRICTED: Apple Internal and Support Providers Only ***
Not For General Public Release

Is there any way to determine which Processor Upgrade Cards are compatible with the various PCI-based Power Macintosh computers?

DISCUSSION

The following chart provides compatibility information for the various Processor Upgrade Cards available for the following computers:

- Power Macintosh 7300, 7500, 7600, 8500, and 8600 series computers
- Power Macintosh 9500, 9600
- Apple Workgroup Servers 7350, 855,0 and 9650

All PCI-based Power Macintosh computers listed above will support Processor Upgrade Cards of up to 233 MHz.

Important: Processor cards for the following Power Macintosh computers are not compatible with the computer models listed above. Also, processor cards for the computer models listed above are not compatible with the following Power Macintosh computers:

- Power Macintosh 8600/250
- Power Macintosh 8600/300
- Power Macintosh 9600/300
- Power Macintosh 9600/350
- Apple WorkGroup Server 9650/350

The following information will assist you in reading the matrix below.

Service Parts Number

Apple-authorized service providers use the service part numbers to order service parts from Apple.

Assembly Number

If you do not know the finished goods or service part numbers of a particular processor card, use the assembly code to determine compatibility. The assembly part numbers are placed on the card with either a sticker or white stenciling.

Label

Some cards may have a label on them to clarify compatibility but some labels inaccurately identify which machines the card will work with. Rely on the service part number instead.

Note: Some cards are being upgraded to the appropriate level when sent in from the field. Please check the Service Price Pages and the Service Source CD for more information.

PC Exchange and ZIP Drive Issues (6/96)

Article Created: 6 June 1996

TOPIC -----

There have been reports of issues with the Iomega ZIP drive and the PC Exchange control panel. Users are either not able to select the Iomega ZIP drive in the PC Exchange control panel, or they cannot see all of the files or folders on the drive.

Below is greater detail users have reported:

- In the PC Exchange control panel, after clicking Options..., no device driver for a Iomega ZIP drive is available.
- When using PC Exchange to mount a ZIP drive, not all of the files or folders are seen in the Finder. When choosing Find File in the File menu on the ZIP drive, the files and folders are visible, but these files still do not show up in the finder. All of the files and folders are visible when using the ZIP drive on a PC.

DISCUSSION -----

Iomega ZIP drive and the PC Exchange control panel

The reason you cannot see the ZIP drive in the PC Exchange control panel is because PC Exchange has an internal list of supported devices and the ZIP drive is not on the list. The ZIP drive will probably not be added to this list because the driver that ships with the drive is PC Exchange aware. DOS formatted ZIP cartridges can be used with the driver that ships with the drive.

You need to run the installer which puts the Iomega Driver extension in the extensions folder. Restart the Macintosh, insert a DOS formatted ZIP cartridge, and it appears on the desktop. The cartridge may need to be formatted using SCSIUTIL.EXE that ships with the ZIP drive. There is no need to configure PC Exchange to mount the cartridge, however, PC Exchange, Access PC, or DOS Mounter must also be installed on the Macintosh.

Cannot see all of the files or folders on the drive

Below are two issues we are aware of that may be causing this:

- PC Exchange (2.0.x) has a limit of displaying 512 files in a subdirectory.
- This sounds similar to an issue with CD-ROM discs. All of the files and folders could not be seen on a CD-ROM when Connectix Corporation's RAM Doubler 1.5.1 is installed, and file sharing is turned on. This incompatibility was fixed in RAM Doubler 1.5.2 or later. You should upgrade RAM Doubler, if RAM Doubler is being used.

Power Macintosh 5400/120: All Software Isn't Installed (6/96)

Revised: 6/6/96
Security: Everyone

Power Macintosh 5400/120: All Software Isn't Installed (6/96)

=====

Article Created: 6 June 1996

TOPIC -----

I recently performed a clean installation of System 7.5.3 Revision 2 on my Power Macintosh 5400/120. However, it appears that I no longer have the software that was originally installed. What other software needs to be installed? Is there any particular order I need to reinstall this software?

DISCUSSION -----

Your Power Macintosh 5400/120 computer includes the following pre-installed software. The items are listed in the same order as the software is installed at the factory, but you do not need to install the software in any particular order.

- System 7.5.3 Revision 2

This installer is located on the Apple Macintosh CD: Install System Software: System 7.5.3 installation (alias).

- Apple Video Player

This installer is located on the Apple Macintosh CD: Apple Extras: TV/FM Software: Install Video Software.

This installer places both the Apple Video Player and the Apple FM Radio in the Apple Menu Items folder. There is not a Custom Install option for this installer. However, currently the Apple FM Radio does not add any functionality to your computer so you may safely remove it.

- QuickDraw 3D

This installer is located on the Apple Macintosh CD: Apple Extras: QuickDraw 3D: Installer.

- QuickDraw 3D Scrapbook

After installing QuickDraw 3D, you will have a Scrapbook file containing two 3D models in the following location:

Hard Drive: Apple Extras: QuickDraw 3D Folder: Scrapbook file

In order to use this Scrapbook, you need to put it in your System Folder and replace the Scrapbook file that is currently there.

IMPORTANT: If you replace your current Scrapbook file with the one created by QuickDraw 3D, you will lose any information that you have added. Be sure to copy this information before replacing the file.

WorldScript: Component Names & Version History Questions (6/96)

Article Created: 6 June 1996
Article Reviewed/Updated: 7 June 1996

TOPIC -----

What is the difference between "WorldScript Updater", "WorldScript Pieces Install", and "7.5.1 WorldScript Updater"?

Why is the WorldScript Power Adapter extension installed by the System 7.5.3 installer, when the rest of the required software (if you happen to be using WorldScript) is not?

DISCUSSION -----

Different Names For The Same Thing

"WorldScript Updater", "WorldScript Pieces Install", and "7.5.1 WorldScript Updater" are all the same thing. The next WorldScript Update is expected to have only one name.

Worldscript Updater Versions

There are two versions of the "Worldscript Updater" currently available, version 1.0 and version 1.0.1. Version 1.0 is currently posted online. New machines, such as the Power Macintosh 5400/120, include version 1.0.1, which should be used in place of version 1.0.

The changes in 1.0.1 are as follows:

Begin_Table

Version 1.0	Version 1.0.1
-------------	---------------

InputBackSupport	(7.5.1)	InputBackSupport	(7.5.3)*
WorldScript I	(7.5.1)	WorldScript I	(7.5.2)**
WorldScript II	(7.5.1)	WorldScript II	(7.5.1)***

End_Table

* Version 7.5.3 of InputBackSupport includes changes for the Korean Language Kit (KLK) support.

** Version 7.5.2 of WorldScript I fixes a bug that occurred when used with Adobe Type Manager and fixes a problem in the Hebrew and Arabic Setting control panels.

*** Version 7.5.1 of WorldScript II was not revised for version 1.0.1.

Why The WorldScript Power Adapter Is Always Installed

=====

The WorldScript Power Adapter extension includes patches that improve overall printing performance. These improvements are independent of Language Kit software. This is why it is installed by the System 7.5.3 installer while the rest of the required Language Kit/Worldscript software is not. The name of this extension may be misleading, except that it also includes some WorldScript enhancements.

12 Inch PC Compatibility Card: Video RAM Explanation (6/96)

Revised: 6/6/96
Security: Everyone

12 Inch PC Compatibility Card: Video RAM Explanation (6/96)

=====

Article Created: 6 June 1996

TOPIC -----

In reading the PC Compatibility Card User's Manual (for 12-inch card), it is explained on page XIII that 1 MB of video DRAM can be added to the card. Yet on page 195, the DRAM chip is described as being "256K x 16". Further, the silk screening on the card and the part number of the chips that are soldered down suggest that the chips are indeed 256K.

How is it that we are getting the first 1 MB of video DRAM by using two chips that are 256K each? And how can 1 MB of video DRAM be added by using two 256K chips?

DISCUSSION -----

The DRAM used is 256K X 16, this multiplies out to 4,096,000 bits. Each byte is made up of 8 bits, so 4,096,000 bits divided by 8 bits equals 512,000 bytes. Using two of these 256K x 16 video DRAM chips adds up to 1,024,000 bytes (or 1 MB).

Apple MessagePad 120: Upgradeable to MessagePad 130? (6/96)

Revised: 4/21/97
Security: Everyone

Apple MessagePad 120: Upgradeable to MessagePad 130? (6/96)

=====

Article Created: 6 June 1996

TOPIC -----

I own an Apple MessagePad 120 and would like to have a backlit screen like the one that comes standard on the Apple MessagePad 130. Is there an upgrade available?

DISCUSSION -----

There is no upgrade available. Upgrading from a Apple MessagePad 120 to an Apple MessagePad 130 would require a new screen and a new logic board. The cost of such an upgrade would be significant, making it more practical to purchase a MessagePad 130 instead of upgrading your Apple MessagePad 120.

At Ease 3.0.1: Can't Lock Power Macintosh 7200 Hard Disk (6/96)

=====

Article Created: 6 June 1996
Article Reviewed/Updated: 21 June 1996

TOPIC -----

I cannot lock the startup volume with At Ease 3.0.1 running on Power Macintosh 7200 computers with System 7.5.3. The option is available in the User Settings menu, and is checked, but I can still start up from a CD-ROM disc or floppy disk and access the hard drive.

DISCUSSION -----

This issue is resolved in At Ease 3.0.2, which is available on the online services.

Once you update to At Ease 3.0.2, you should disable the Lock StartupDisk feature, quit the administration application, and then re-enable Lock StartupDisk. This will ensure that the latest update code is installed on your startup disk.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Mac OS and Microsoft Works 4.0b (6/96)

Revised: 6/7/96
Security: Everyone

Mac OS and Microsoft Works 4.0b (6/96)

=====

Article Created: 7 June 1996

TOPIC -----

I cannot get Microsoft Works 4.0B loaded on my Macintosh computer which is running Mac OS 7.5.3. After clicking on Setup on disk 1, I get a message saying "Install was unsuccessful." I never even get to the first dialog box.

DISCUSSION -----

Microsoft Technical Support stated that Microsoft Works 4.0b installs correctly on Mac OS 7.5.3. They did state that virtual memory should be turned on and the Mac OS date should be set to the standard US date format. If the problem persists, please contact Microsoft directly.

Color LaserWriter 12/600PS: Moving Precautions and Errors (6/96)

Revised: 6/20/96
Security: Everyone

Color LaserWriter 12/600PS: Moving Precautions and Errors (6/96)

Article Created: 18 June 1996

TOPIC -----

What precautions should be taken when transporting or moving the Color LaserWriter 12/600 PS to another location? What errors may occur after moving the printer and what can I do to eliminate them?

DISCUSSION -----

The Color LaserWriter 12/600 PS is large and heavy, and requires special handling considerations before moving in order to prevent damage. The printer circulates a supply of oil through the fusing system to coat the fuser rollers. Moving a Color LaserWriter without first removing the fuser oil bottle and all remaining oil will most likely result in spilled oil. Spilled oil can contaminate the oil overflow sensor causing an error condition or image quality problems if it gets on the transfer drum or other parts of the imaging system. Although less severe, the oil can create a mess if it migrates onto the interior and exterior plastics.

The following procedures in addition to those documented in the User's Guide can be taken to minimize problems when moving the Color LaserWriter 12/600 PS printer.

Moving Instructions
=====

Moving Within the Same Office

For general movement within the same office the printer can be transported on a cart as long as it is not tipped while lifting or moving the printer. If the printer is tipped, oil will spill from the open oil pan at the bottom of the fuser assembly. If there is any possibility that the printer will be tipped then the fuser oil should be removed.

Moving to Another Location Without Repackaging The Printer

Remove the four toner cartridges, waste toner bottle, fuser oil bottle, and the photoconductor. Use the orange shipping fixture for the photoconductor to protect it from damage and insert it into the lightproof bag if available. The waste toner bottle should be capped to prevent toner leakage.

Pump the teal green paper jam release lever on the right of the fuser assembly 50 times to transport oil already in the system back to the oil reservoir. Use a small turkey baster or a large syringe to extract the oil from the reservoir. Repeat the procedure if necessary until all of the oil has been removed.

Remove the fuser assembly from the printer using the procedures documented in the fuser replacement section of the LaserWriter 12/600 PS User's Guide. Seal the fuser assembly in a plastic bag and transport it separate from the printer. Reinstall the fuser assembly and the consumables after the printer has been placed in its new location.

Shipping to Another Location in the Original Packaging

Follow the instructions above for moving the printer without repackaging, adding the following steps:

Reinstall the orange transfer drum shipping screw assembly that ships with all new printers. This screw is necessary to prevent damage to the delicate transfer drum and its drive mechanism.

Tape closed any plastic covers that could open or become dislodged during transport. Use fiber reinforced packaging tape similar to that originally used to package the printer. Pay particular attention to the front door, fuser access door, multipurpose tray, and the paper cassette tray.

Carefully inspect the cardboard cover, foam shipping blocks, and wooden pallet before repackaging the printer. DO NOT reuse damaged packaging materials or severe shipping damage may result.

Reinstall the fuser assembly and the consumables after the printer has been placed in its new location.

Setting up the Printer and Eliminating Potential Errors

=====

Once the printer is at its new location, make sure it is installed onto a level surface. If the Color LaserWriter is not placed on a level surface then fuser oil may accumulate in the fuser assembly oil catch tray causing an error condition. A fuser oil pump overflow error is indicated on the status panel by alternately flashing the paper out and paper jam LEDs while the yellow toner cartridge LED and the photoconductor maintenance LEDs remain on.

Follow these steps to eliminate the oil overflow condition:

Step 1: Level The Printer And Its Supporting Surface

Use a small line level to verify that the surface the printer will be placed on is flat and level. If the surface that the printer is placed on is level and stable then it is unlikely that any additional leveling of the printer will be necessary once it is put into place. Many tables contain leveling feet which make leveling easier.

Check the printer to see if it is level by opening the top cover and placing a line level on the yellow felt covered surface of the fuser assembly. The front of the printer must be no higher than the rear to aid the flow of fuser oil back to the oil reservoir.

CAUTION:

Under NO circumstances allow the FRONT of the printer to be higher than the REAR of the printer.

Leveling the Color LaserWriter 12/600 PS from left to right is not as critical.

Step 2: Pump The Fuser Jam Release Lever To Remove Excess Oil

Open the fuser access door to locate the teal green fuser paper jam release lever. Pump the lever 50-70 times to manually remove excess oil from the fuser assembly oil catch tray and move it back to the oil reservoir. Under most circumstances this action will allow the oil overflow sensor flag to drop back to its normal operating position.

Step 3: Allow Oil To Flow Back Into Reservoir

Raise the right front corner of printer no more than 1 inch and hold for 15-20 seconds.

Step 7: Power On Printer

Turn the printer back on and wait for startup pages or ready LED.

If these steps do not correct the problem, the printer may require service to resolve this issue.

QuickTake 100 & System 7.5.3 Incompatibility (10/96)

Revised: 10/18/96
Security: Everyone

QuickTake 100 & System 7.5.3 Incompatibility (10/96)

Article Created: 11 June 1996
Article Reviewed/Updated: 18 October 1996

Topic-----

After installing the System 7.5 Update 2.0 on my Power Macintosh, I am no longer able to view pictures from my QuickTake 100. When trying to view a picture, the application either quits or I get a message that says "Unable to view the slide because of an error."

Discussion-----

This was previously thought to be an incompatibility with the System Update 2.0 Enabler. However, through further investigation, we have determined the cause to be an incompatibility between QuickTime 2.1 and the QuickTake 1.0 application. To correct this, you need to use QuickTime 2.5 instead of QuickTime 2.1.

Apple System Profiler On A Power Macintosh 7600/120 (6/96)

Revised: 6/11/96
Security: Everyone

Apple System Profiler On A Power Macintosh 7600/120 (6/96)

=====

Article Created: 11 June 1996

TOPIC -----

When I used the Apple System Profiler (ASP) 1.0 on my Power Macintosh 7600/120, it said that it was a Power Macintosh 7600/100.

Since I upgraded to the latest version of ASP, version 1.0.1, it now says that my Macintosh is simply a "Power Macintosh."

Since neither ASP version 1.0 or 1.0.1 seem to be able to identify my computer, which version should I be using?

DISCUSSION -----

Apple System Profiler version 1.0.1 was written to support the new Enhanced PCI-based Power Macintosh computers* including the Power Macintosh 7600/120.

However, Apple Engineering is aware that version 1.0.1 still does not properly identify the Power Macintosh 7600. Apple intends to address this issue in the next release of Apple System Profiler.

*NOTE: The enhanced PCI-based Power Macintosh computers include the following computer series:

- Power Macintosh 7200/120
- Power Macintosh 7600/120
- Power Macintosh 8500/132
- Power Macintosh 8500/150
- Power Macintosh 9500/150

AppleShare: Changing Startup Disks (6/96)

Revised: 6/11/96
Security: Everyone

AppleShare: Changing Startup Disks (6/96)

Article Created: 11 June 1996

TOPIC -----

This article describes how to change the startup disk when using AppleShare File and/or Print Server. For additional information please check the AppleShare Admin Guide, which provided the information below, that came with your AppleShare software or Workgroup Server.

DISCUSSION -----

At some point, you may want to change startup disks. In addition to installing AppleShare on the new disk, there are additional steps you need to take to maintain your original user accounts and access privileges.

To change startup disks:

Step 1

Connect the hard disk you want to use as the startup disk for the server computer.

Step 2

Install System Software and AppleShare software on the new startup disk.

Supported Mac OS releases:

AppleShare 3.0.1	- System 7.0 or greater
AppleShare 4.0.1/4.0.2	- System 7.0.1 or greater
AppleShare 4.1	- System 7.1.2 or greater
AppleShare 4.2	- System 7.5.1 or greater
AppleShare 4.2.1	- System 7.5.3

Step 3

From the Finder, copy the User & Groups Data File and File Server folder from the Preferences folder on the original startup disk to the Preferences folder on the new startup disk. The Preferences folder is inside the System Folder.

IMPORTANT: If you have been providing print service from the original startup disk and want to do so from the new startup disk, you also need to copy the AppleShare Print Server folder from the old Preferences folder.

Step 4

From the AppleShare Admin program, copy any other files or folders from the original startup disk to the new startup disk. To copy folders to the new startup disk while retaining their access privileges, choose Copy <Item> from the Privileges menu.

This step is necessary only if you are replacing the original startup disk. If you plan to use both hard disks, you can skip this step.

Step 5

Click the new disk's icon in the new disk's Startup Disk control panel. To open the Startup Disk control panel, choose Control Panels from the Apple menu, then double-click the Startup Disk icon.

Step 6

Choose Restart from the Special menu. After the server computer has restarted, you can provide file service from the new startup disk.

Language Kits: How to View Web Sites in Other Languages (6/96)

=====

Article Created: 11 June 1996

TOPIC -----

I have the Japanese Language Kit installed on my computer and am using the Apple Internet Connection Kit, which includes Netscape as the web browser application. I would like to be able to view web sites in Japanese, but the text appears garbled. How can I setup Netscape to properly view Japanese?

DISCUSSION -----

Netscape allows you select different language encoding and font displays. You can setup different fonts for different encodings and just change the encoding whenever you look at a different web site.

Follow these steps to change the language encoding to Japanese in Netscape v1.1 and v2.0.

Netscape 1.1
=====

Step 1

Choose Preferences from the Options menu.

Step 2

Choose Fonts and Colors from the pop-up menu.

Step 3

Choose Japanese from the For the Encoding pop-up menu.

Step 4

Set Japanese Fonts to Font setting.

Step 5

Set Default Encoding to SJIS and check Auto Select.

Netscape 2.0

=====

Step 1

Choose General from the Options menu.

Step 2

Choose Fonts panel.

Step 3

Choose Japanese from the For the Encoding pop-up menu.

Step 4

Set Japanese Fonts to Font Setting.

Step 5

Click OK.

Step 6

Choose Documents Encoding from the Options menu.

Step 7

Choose Japanese Auto-Detect

AppleShare Workstation 3.6.2 & System 7.5.3 Performance (6/96)

=====

Article Created: 11 June 1996

TOPIC -----

I have Power Macintosh computers running System 7.5.3, AppleShare Workstation 3.6.2 connecting to an AppleShare File Server 4.2.1 on a 10Base-T network. I'm getting complaints from users that they are getting slower performance in Finder Copies, to or from the server, than they were with computers were running System 7.5.2 and AppleShare Workstation 3.6.1.

Is there an issue with the AppleShare Workstation 3.6.2 software running with System 7.5.3 in regards to performance?

DISCUSSION -----

The issue you describe is known, and it will be resolved in the version of AppleShare Workstation that ships with the next major revision of AppleShare.

Apple is also considering the possibility of including a fix, to the AppleShare Workstation, in a system update release.

Macintosh 5xxx/6xxx Tester: Read Me (12/96)

Revised: 12/5/96
Security: Everyone

Macintosh 5xxx/6xxx Tester: Read Me (12/96)

Article Created: 11 June 1996
Article Reviewed/Updated: 5 December 1996

TOPIC -----

This article contains the ReadMe file for the 5xxx/6xxx Tester application, which should be used with all Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers to test for known component issues that may cause system freezing.

Note: The models that may be affected by these systems are Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300. (The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.)

DISCUSSION -----

5XXX/6XXX Tester
=====

The 5XXX/6XXX tester is designed to perform a diagnostic test on the logic board. It is designed to test for known component issues which may cause system freezing. It should only be run on Power Macintosh/Performa 5XXX/6XXX series computers, as the information it provides is only of benefit for those machines. Please note that this application is not designed for use with the Power Macintosh/Performa 5400, 6360 and 6400 computers.

If you are experiencing problems with your computer other than system freezing, please contact Apple computer or an authorized Apple service provider. Other helpful information can be found in the "Troubleshooting" section of your User's Guide or on Apple's internet web site. Apple's web site is located at <<http://www.info.apple.com>>.

If this application is run on a Power Macintosh/Performa 5XXX/6XXX series computer and it finds a problem, it will present one of the following messages:

The logic board has been checked and a potential issue has been found. Please contact Apple customer support or an Apple Authorized Service Provider to have the logic board replaced as part of the repair extension program.

A potential issue with the Cache has been found. Please contact Apple customer support or an Apple Authorized Service Provider to have the Cache replaced as part of the repair extension program.

If no problems have been found, this application will present the following message:

The logic board has been checked and none of the specific, known hardware issues that are covered under this program were found. If you are experiencing problems, we recommend that you verify that any software applications you are using are compatible with your computer. You can do this by contacting the developer of the software. You should also follow the procedures described in the troubleshooting section of the User's Guide to reduce any freezing issues you are experiencing.

Power Macintosh 5400/120: Disk Icon at Startup (7/96)

Revised: 7/13/96
Security: Everyone

Power Macintosh 5400/120: Disk Icon at Startup (7/96)

Article Created: 12 June 1996
Article Reviewed/Updated: 13 July 1996

TOPIC -----

Whenever I start up my Power Macintosh 5400/120 computer, a disk icon appears on the screen before the "happy Macintosh". Sometimes when this happens, a flashing question mark also appears in the disk icon. This has happened since the first time I started up the computer. What is causing this?

DISCUSSION -----

The Power Macintosh 5400/120 computer does not have a startup volume selected in the Startup Disk control panel. So, the computer checks the floppy drive, then the SCSI bus, and finally the IDE ATA bus for the startup volume. This checking can cause a slight delay in the start up process. This phenomenon is normal on the Power Macintosh 5400/120, but you can follow these steps to resolve it:

Step 1

Open the Startup Disk control panel.

Step 2

Select the internal hard disk as the Startup Disk.

Step 3

Close the control panel and restart the computer.

The computer should now start up normally. However, resetting the Parameter RAM (PRAM) on the computer deselects the Startup Disk again, causing the issue to reappear. So, after resetting PRAM, you need to repeat these steps.

PowerBook 5300 & 190: Sound Specs Questions & Answers (6/96)

Revised: 6/28/96
Security: Everyone

PowerBook 5300 & 190: Sound Specs Questions & Answers (6/96)

Article Created: 12 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

- 1) What are the total harmonic distortions from input to output?
- 2) What is the frequency response of the sound?
- 3) I need some information about all the other sound specifications for the Macintosh PowerBook 190 and 5300 series computers.

DISCUSSION -----

NOTE: Complete information on these topics is available in the PowerBook 190 and 5300 developer notes.

- 1) Question: What are the total harmonic distortions from input to output?

Answer: Total harmonic distortion and noise is less than 0.05 percent with a 1-V rms sine wave input. The signal-to-noise ratio (SNR) is 85 dB, with no audible discrete tones.

- 2) Question: What is the frequency response of the sound?

Answer: 20hz to approximately half the selected sampling rate which would be 22Khz, 11Khz, or 5.5Khz.

- 3) Question: I need some information about all the other sound specifications for the Macintosh PowerBook 190 and 5300 series computers.

Answer:

Output Impedance

The Output Impedance, nominal is 32 ohms.

Frequency Response Of The Speakers

The frequency response of the speakers will be 20 Hz to 20,000 Hz.

Line Level Input

Line Level is a standard in the audio field and now in the computer industry. Line level is defined as 1 volt peak to peak. Line Level provides an industry standard so that all audio and other electronic equipment can operate properly together. Most VCRs, including both home and professional audio equipment use Line Level as a standard.

Audio Input

The audio input of the 190 and 5300 series PowerBook is specified to operate at 5.6V Peak to Peak.

Line In Impedance

Line In Impedance: 6.8K ohms

Max Input

Max Input before clipping, Singer (sound chip) gain = 0 dB is 2 Vrms, nominal 5.6 Vpp

Max Output

Max Output into 10 k ohm load 1.4 Vrms, nominal 2 V Peak to Peak. The output level will of course drop with a low impedance load like headphones; the 2 Vpp, 32 ohm Thevenin equivalent is well suited to drive headphones.

16-bit stereo

CD-quality, 16-bit stereo sound capable of driving headphones or other stereo equipment.

Analog/Digital Conversion

Digital-to-analog and analog-to-digital conversion sampled at 11.035, 22.050, or 44.100 kHz.

This article was published in the Information Alley on 12 June 1996.

Apple Media Tool: Not Enough Internal Memory Error (6/96)

Revised: 6/18/96
Security: Everyone

Apple Media Tool: Not Enough Internal Memory Error (6/96)

=====

Article Created: 17 June 1996

TOPIC -----

I created a runtime multimedia project using Apple Media Tool 2.0. When I try launching this project on my Power Macintosh 8100 an error message appears that reads: Not Enough Internal Memory (2). When I launch this project on my Power Macintosh 8500, I get further into the presentation before this same error message appears.

I have allocated 30 MB of additional memory to Apple Media Tool, but that has not helped either. According to the About This Macintosh screen, Apple Media Tool is only using approximately 4 MB of the 30 MB.

DISCUSSION -----

There is an undocumented feature in Apple Media Tool 2.0 to increase the project Heap and Stack, which allows you to build larger and more complex projects.

To increase the project Heap and Stack, hold down the Control key on the keyboard while launching Apple Media Tool and Runtime Maker. You should increase the size of the heap from 4K to 10K to build and compile larger and more complex projects.

System 7.5 Update 2.0: System 7.5.3 Differences (6/96)

Revised: 6/13/96
Security: Everyone

System 7.5 Update 2.0: System 7.5.3 Differences (6/96)

Article Created: 13 June 1996

TOPIC -----

I am using System 7.5.3 that came pre-installed on my Power Macintosh 8500/132. What are the differences between the System 7.5.3 included on my computer versus System 7.5.3 on a different computer, such as a Macintosh that had System 7.5 Update 2.0 installed? Do I need to install System 7.5 Update 2.0 on my Power Macintosh 8500/132?

DISCUSSION -----

There are a few differences between System 7.5.3 as it appears on Enhanced PCI-based Power Macintosh computers (Power Macintosh 7200/120, 7600/120, 8500/132, 8500/150, and 9500/150) versus existing Macintosh computers upgraded to System 7.5.3. The files that are different are listed below:

Begin_Table

Name	Version in A	Version in B
Apple Menu Options	1.1.1	1.1.2
Apple Video Player	1.3.2	1.4
Mouse control panel	7.5.2	7.5.3
Monitor Resolution control strip	1.0	1.0.1
Apple Modem Tool	1.5	1.5.5
Open Transport Guide Additions	1.3	1.3.1
Video Startup extension	1.3.2	1.4

A - System 7.5.3 on Enhanced PCI Power Macintosh computers
B - System 7.5 Update 2.0

End_Table

System 7.5 Update 2.0 is focused on fixing issues with computers that came out prior to the Enhanced PCI-based Power Macintosh computers. Bug fixes included in System 7.5 Update 2.0 that may be of benefit to enhanced PCI-based Power Macintosh users are listed below:

- System 7.5 Update 2.0 fixes a memory leak in Standard File, which causes 512 bytes of memory to be orphaned in the application heap, each time a file is opened.
- System 7.5 Update 2.0 fixes an obscure bug in the Power Manager which causes a system freeze under the following scenario:
 - AppleTalk is off
 - Open the AppleTalk or TCP/IP control panels, which turns on AppleTalk

This bug is easily avoidable by turning on AppleTalk from the Chooser before opening the AppleTalk or TCP/IP control panels.

- System 7.5 Update 2.0 fixes an obscure bug where the system may freeze during startup. It only occurs if there is insufficient memory available during startup. Possible scenarios are: majority of memory is used by a RAM Disk, majority of memory is used by the Disk Cache, and/or many memory intensive third party extensions are installed.
- System 7.5 Update 2.0 fixes a bug in the Display Manager. This bug appears when a system with menus that are too large to appear on the screen. For example, using a 640 x 480 screen on a Macintosh with many items in the Apple Menu Items folder could cause this bug to appear.
- System 7.5 Update 2.0 fixes a bug in how the Display Manager saves the Preferences file. When this bug occurs, the Macintosh desktop may not appear at startup.
- System 7.5 Update 2.0 fixes a bug in the Notification Manager. Without this fix, the wrong flashing icon could appear in the Application menu. In addition, this fixes issues with the clock and battery level indicators not being redrawn correctly when an alert sound is played.
- System 7.5 Update 2.0 makes the default recording mode on all PCI-based Power Macintosh computers to be the same as other Macintosh computers.
- System 7.5 Update 2.0 includes Apple Video Player 1.4, which fixes a system freezing issue on computers with MPEG cards.
- System 7.5 Update 2.0 includes Apple Menu Options 1.1.2, which has shown to improve compatibility with some third party software.

We believe that it is unlikely that Enhanced PCI-based Power Macintosh users will be impacted by these bugs. However, it is possible to avoid these issues by installing System 7.5 Update 2.0 on an enhanced PCI-based Power Macintosh.

ImageWriter LQ shifting page with QuickDraw GX 1.1.3 (6/96)

Revised: 6/18/96
Security: Everyone

ImageWriter LQ shifting page with QuickDraw GX 1.1.3 (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

I am using an ImageWriter LQ with System 7.5.3 and QuicDraw GX 1.1.3. When printing using the QuickDraw GX driver, the page shifts down one inch and then starts to print. With QuickDraw GX disabled and using the ImageWriter LQ driver (version 7.0.1), the page backs up one inch before printing so the print job starts in the right place.

DISCUSSION -----

Apple has reproduced this issue and is looking into it. It appears that the ImageWriter LQ GX driver starts printing about 3/4" from the top of the page. This occurs no matter which options (paper size, manual feed, and so on) are selected.

Until a fix for this issue is available, there are two possible workarounds if you wish to continue to use QuickDraw GX:

- If your application is QuickDraw GX aware, you can use the GX Paper Type Editor (which is part of the custom install of QuickDraw GX Utilities) to lessen the added space at the top of the page by 1/4". Follow these steps to create a custom paper type:

Step 1

Create a custom paper type, modeling it after US Letter and giving it a top margin of 0" instead of the default 1/4".

Step 2

Save this paper type in the Extensions folder

Step 3

Use the Page Setup dialog box to select the custom paper type for the page being printed.

- If your application is not QuickDraw GX-aware, use QuickDraw GX Helper, which lets you disable QuickDraw GX desktop printers. So, you can use the non-GX ImageWriter LQ driver even with QuickDraw GX enabled. This method will provide the original margins.

QuickDraw GX Helper is not installed as part of the Easy install option of QuickDraw GX. You must use the Custom install option and specifically choose QuickDraw GX Utilities.

AppleShare 4.2.1: Product Description (7/96)

Revised: 7/1/96
Security: Everyone

AppleShare 4.2.1: Product Description (7/96)

Article Created: 13 June 1996
Article Reviewed/Updated: 1 July 1996

TOPIC -----

This article describes AppleShare 4.2.1.

DISCUSSION -----

AppleShare is high-performance, easy-to-use file and print sharing software that allows networked Macintosh and Microsoft Windows (including Windows 95) software-based computers to share files, applications, and printers.

With AppleShare file server software, organizations can store all of their shared files and applications in a single, central location, providing convenient, easy access to every user on the local area network. By allowing networked users to centralize all key files and applications for easy sharing, AppleShare improves everyone's productivity. It eliminates time spent looking for files, worrying about misplaced documents, and determining the file or application version.

AppleShare print server software offers all users queued access to up to five networked printers. This time saving function allows users to be more productive because they can use their computers to tackle other tasks instead of waiting for documents to print.

With Apple Remote Access MultiPort Server software -- now included with AppleShare -- Macintosh users can access AppleShare servers over a dial-up link, so even mobile users can take advantage of AppleShare file, print, and application services. The AppleShare network architecture coexists with other application programs and networking services such as Novell NetWare, Windows for Workgroups, and even the Internet.

Yet for all of its power and capabilities, AppleShare is extremely easy to set up, use, and maintain. It continues in the "plug and play" tradition established by the Macintosh more than a decade ago; most system administrators find that

they can get an AppleShare server up and running within 15 minutes. And overall maintenance—including the addition and deletion of users—is so simple that a dedicated, full-time administrator is not required. In fact, because AppleShare is so easy to install, maintain, reconfigure, and expand, it offers the lowest long-term cost of ownership of any product in its class.*

Whether your organization is a small or medium-size business, a classroom, or a department within a global enterprise, AppleShare improves collaboration and increases efficiency for all users.

*Based on a report by Business Research Group, Newton, MA

Features

Powerful file and print services

- Lets users store their files and applications in a single, central location
- Makes it easy and efficient to print documents to networked printers
- Provides comprehensive, easy-to-implement security
- Includes Apple Remote Access MultiPort Server software for remote connections to AppleShare servers and services (AppleShare 4.2.1 only)

Ease of use

- Installs with a single click of the mouse
- Can be up and running in minutes
- Makes day-to-day management quick and easy
- Users can take advantage of file and print services from either Macintosh computers or Windows software-based PCs

Compatibility

- Includes full support for both Macintosh and Windows clients
- Server works with all Mac OS-compatible applications

Performance and scalability

- Supports up to 250 users
- Performs up to 10 times faster than built in Mac OS file sharing
- Can be configured for use in an AppleTalk network of any size
- Is scalable from LocalTalk to Ethernet networks, and beyond
- Offers highest performance when running on PowerPC-based Workgroup Servers

Ordering and Licensing Information

AppleShare 3.0.1

Order No. M0090LL/B

AppleShare 4.0.2

Order No. M3995Z/A

AppleShare 4.2.1

Included with certain Workgroup Servers and available as an upgrade for AppleShare 4.x customers. Includes Apple Remote Access MultiPort Server software version 2.1. and the AppleShare Client for Windows 1.0.2.

AppleShare Client for Windows 1.0.2

Order No. M3481Z/B

Included in all Workgroup Server configurations; client network license allows the installation of the client software on any Windows software based PC on the network; includes Windows 95 support (with third-party software).

For more information, please see Tech Info Library article, "AppleShare Client for Windows 1.0.2 and Windows 95."

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

AppleShare 4.2.1: Product Details (8/96)

=====

Article Created: 13 Jun 1996
Article Reviewed/Updated: 22 August 1996

TOPIC -----

This article provides the product details and order information for AppleShare 4.2.1.

DISCUSSION -----

Product Details

Capabilities and services

- Includes file and print servers
- Supports Mac OS program linking and publish and subscribe
- Features an open environment that allows additional network services
- Macintosh client software built into every Macintosh; Windows client software sold separately
- Includes Apple Remote Access MultiPort Server software for remote dial-up connections (AppleShare 4.2.1 only)

Sharing options

- On-line CD-ROM exchange
- Sharing of folders or entire disks
- Easy server selection through the Chooser
- Intuitive, consistent access to shared resources
- User-controlled access to information

Print spooling

- Provides spooling for up to five networked printers
- Offers centralized queue management
- Accepts simultaneous print requests
- Frees client workstations for use immediately
- Includes print log for up to 1,000 print jobs

Administrator control

- Administrator can set number of connected users
- Server messages can be broadcast or sent to selected users
- Administrator can set cache sizes to maximize performance

Security

- Minimum password length
- Password aging
- Password history to prevent immediate reuse
- Ability to disallow saved passwords
- Account disabled after specified number of password failures
- Adjustable time limit for temporary accounts
- Guest access allowed; turned off by default
- Copy-protection setting for documents
- "Lock" setting for folders
- Adjustable number of concurrent application launches
- Inherited folder privileges
- Administrator log-off of any user

Network requirements

- An AppleTalk network connection (via LocalTalk, Ethernet, Token Ring, or dial-up connection via Apple Remote Access software)

AppleShare Product Family

AppleShare software comes in three versions that are designed to accommodate a variety of workgroup sizes and performance needs.

AppleShare 3.0.1 is designed for smaller work-groups of Macintosh and Windows software-based computers that have outgrown the basic file-sharing capabilities of the Mac OS. It runs on 68030-based, or earlier, Macintosh computers.

AppleShare 4.0.2 offers significant performance improvements over AppleShare 3.0.1, and runs on 68040-based Macintosh computers. Like AppleShare 3.0.1, it's appropriate for smaller, cross-platform workgroups that want to move beyond simple Mac OS file sharing, and is extremely easy to set up and administer.

AppleShare 4.2.1 is the highest-performance AppleShare version available. Optimized for Apple PowerPC processor-based Workgroup Servers, it offers higher performance and supports more users than previous versions, yet retains the ease of use shared by the other product offerings in the AppleShare family.

Begin_Table

Specifications	3.0.1	4.0.2	4.2.1	Pro 1.1
-----	-----	-----	-----	-----
Concurrent logons	120	150	250	200

Groups per user	42	42	42	42
Locked ranges/user	20	20	20	20
Apple II logon	yes	yes	yes	no

Apple II network startups	40	n/a	n/a	n/a
Minimum RAM	4MB	8MB	16MB	16MB
System software	7.0	7.1	7.5.1	A/UX 3.1

End_Table

Supported platforms

AppleShare Server

- AppleShare 3.0.1: 68030-based (or earlier) Macintosh computers
- AppleShare 4.0.2: 68040-based Macintosh computers*
- AppleShare 4.2.1: PowerPC processor-based Workgroup Servers only (NuBus and PCI)

AppleShare Client

- Macintosh
 - An Apple Macintosh computer with an internal hard disk drive and at least 4MB of RAM
 - Mac OS software version 6.0.7 or later
 - System 7.5.1 or later required for optimal performance of AppleShare 4.2
- Windows
 - Any IBM or 100 percent compatible computer running Intel processor 386 or greater; ISA, MicroChannel, VISA, EISA, PCI, and internal buses; 4MB of RAM
 - Windows 3.1, 3.11; Windows 95; and Windows for Workgroups 3.11 software
 - MS-DOS 5.0 or later
 - Ethernet network adapter card
 - NDIS 3.0 or ODI network interface driver

*AppleShare 4.0.2 is not designed to run on the Macintosh Quadra 660AV and Macintosh Quadra 840AV computers.

Ordering and Licensing Information

AppleShare 3.0.1

Order No. M0090LL/B

AppleShare 4.0.2

Order No. M3995Z/A

AppleShare 4.2.1

Order No. M4353Z/B

Included with certain Workgroup Servers and available as an upgrade for AppleShare 4.x customers. Includes Apple Remote Access MultiPort Server software version 2.1. and the AppleShare Client for Windows 1.0.2.

AppleShare Client for Windows 1.0.2

Order No. M3481Z/B

Included in all Workgroup Server configurations; client network license allows the installation of the client software on any Windows software based PC on the

network; includes Windows 95 support (with third-party software)

For more information, please see Tech Info Library article, "AppleShare Client for Windows 1.0.2 and Windows 95."

LaserWriter 12/640 PS: Text on Envelopes Smears (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 12/640 PS: Text on Envelopes Smears (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

I am printing envelopes using a LaserWriter 12/640 PS printer and some of the text on the envelopes is getting smeared. How can I prevent this?

DISCUSSION -----

There will be some level of smearing when you print envelopes. Smearing occurs where the envelope is thickest, most commonly appears near the edge of the envelope. In order to minimize the amount of smearing, you should avoid printing close to the edge of the envelopes.

LaserWriter 12/640 PS: Complex Jobs Require More RAM (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 12/640 PS: Complex Jobs Require More RAM (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

I am trying to print a document which contains multiple pages on a LaserWriter 12/640 PS printer. However, I continue to get a single sheet of paper with text that reads:

```
%%[Error: ioerror; OffendingCommand: image; ErrorInfo: DCTDecodeFilter Cannot  
allocate 58608 bytes ]%%  
%%[Flushing: rest of job (to end-of-file) will be ignored]%%
```

Why can I not print this document?

DISCUSSION -----

The document you are trying to print is too complex for the amount of RAM you have installed in the printer. When either complex images or documents containing a large number of multiple fonts on a single page are sent to a 4MB LaserWriter 12/640 PS printer, you will see this error.

The only way to prevent this in the future is to either simplify your documents or add additional memory.

LaserWriter 12/640 PS: Duplex Unit Constantly Jams (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 12/640 PS: Duplex Unit Constantly Jams (6/96)

Article Created: 13 June 1996

TOPIC -----

I have a LaserWriter 12/640 PS printer with the optional duplex unit attached. I am having a problem with paper constantly getting jammed in the duplex unit. How can I correct this?

DISCUSSION -----

Make sure that the duplexer paper guide and connector clips are installed correctly. The instructions for installing the duplex printing unit are on pages 133-141 of the LaserWriter 12/640 PS User's Guide. These instructions are also listed below for your convenience.

Installing the Duplex Printing Unit

With the optional duplex printing unit, you can print on both sides of the paper (often called duplex printing or two-sided printing). You can only duplex print from the paper cassettes. You cannot duplex print from the multipurpose tray.

Note:

The duplex printing unit requires a minimum of 12 MB memory in the printer. For instructions on adding printer RAM, see pages 152-158 in your LaserWriter 12/640 PS User's Guide.

Begin_Table

+=====+	
If you want to	You need this much
	printer memory
+=====+	
Turn on PhotoGrade or use the	12 MB
duplex printing option	
+-----+	

Turn on PhotoGrade and duplex print	20 MB	
on all size paper (except legal)		
+-----+		
Turn on PhotoGrade and duplex print	24 MB	
on all size paper (including legal)		
+=====+		

End_Table

Follow these instructions for installing the LaserWriter 12/640 PS duplex printing unit.

Before you install the duplex printing unit:

- * The printer must be turned off and the power cord unplugged.
- * The printer must be disconnected from your computer or network.

The duplex printing unit adds approximately 2 inches to the height and 4 inches to the depth of the LaserWriter 12/640 PS. Begin by selecting a location for the LaserWriter 12/640 PS that provides enough room to accommodate the increased height and depth of the printer.

If you intend to keep the printer in its current location, make sure that adequate room will be available for opening the top cover and the duplex printing unit door, and maintaining the printer. You will also need to temporarily move the LaserWriter 12/640 PS from its current location to place the duplex printing unit in its place. When moving the printer, be sure to place it on a strong, flat, and, stable surface that can support its weight.

IMPORTANT:

You must remove the optional 500-sheet cassette and feeder from the LaserWriter 12/640 PS if it is already attached. The duplex printing unit must be installed between the LaserWriter 12/640 PS and the 500-sheet cassette and feeder. For instructions on removing the 500-sheet cassette and feeder, see "Removing the 500-sheet Cassette and Feeder" later in this chapter.

Step 1

Turn off and unplug the printer, and disconnect the network cables.

Step 2

Unpack the duplex printing unit and remove any packing materials. Set aside the small package of items.

Step 3

Lift up the back end of the duplex printing unit and slide the metal brace onto the post.

The brace is located on the left side of the duplex printing unit near the back.

Step 4

Unpack the duplex printing unit key.

Step 5

Remove the three covers located in the back of the printer. Remove the two top covers by inserting the key into the side of the covers and pushing gently on the key (the covers will snap off). Remove the bottom cover by inserting the key into the bottom side of the cover and pushing downward (you may need to use some force to remove this cover.)

IMPORTANT:

Be careful when removing the covers so that they do not fall inside the LaserWriter 12/640 PS.

Step 6

Place the bottom cover and the duplex printing unit key in a safe place in case you need them in the future.

If you decide to remove the duplex printing unit, use the cover to prevent dust and other material from getting inside the printer.

Step 7

Place the duplex printing unit where you want the LaserWriter 12/640 PS to be located.

Orient the duplex printing unit so that its tray and the printer's multipurpose tray and paper cassette will be on the same side when the printer is attached.

Step 8

Insert the paper guide for the duplex printing unit into the opening in back of the printer.

Hint:

There are two tabs on the bottom of the paper guide that fit into slots in the back of the printer. When inserting the paper guide, slide it back and forth to easily locate these slots.

The paper guide helps direct the paper to the duplex printing unit.

Step 9

Insert the locking connectors into the slots located on the bottom of the paper guide and push the connectors until they snap into place.

The locking connectors secure the paper guide to the printer.

Step 10

Lift the LaserWriter 12/640 PS, position it directly over the duplex printing unit and gently lower the printer until it sits evenly on the duplex printing unit.

As you lower the printer, align the corners of the printer directly over those of the duplex printing unit.

Step 11

Remove the cassette from the printer and the tray from the duplex printing unit.

Step 12

Insert the four locking connectors into the slots located on the front and back of the printer and duplex printing unit.

The locking connectors secure the printer to the duplex printing unit.

Step 13

Insert the cassette into the printer and the tray into the duplex printing unit.

Step 14

Gently close the duplex printing unit door until it latches into place against the printer. If the door does not close easily, check to make sure the brace is not locked in place.

Step 15

Reconnect the power cable to the printer and reconnect the printer to the network, then turn on the printer.

Step 16

Configure your printer to use the duplex printing unit.

LaserWriter 12/640 PS: Duplex Option Is Not Available (6/96)

Revised: 6/24/96
Security: Everyone

LaserWriter 12/640 PS: Duplex Option Is Not Available (6/96)

Article Created: 13 June 1996
Article Reviewed/Updated: 24 June 1996

TOPIC -----

I installed the optional duplexer on my LaserWriter 12/640 PS printer, but the duplex option is dimmed. How do I use the duplex option?

DISCUSSION -----

In order to use the optional duplex accessory, you must have a minimum of 12MB of RAM in your LaserWriter 12/640 PS printer. The table below shows the options available depending on the amount of RAM you have installed. The LaserWriter 12/640 PS printer uses industry standard 72-pin SIMMs (70ns or faster). The Tech Info Library article titled "LaserWriter 12/640 PS: Memory Configurations" contains a complete list of possible memory configurations.

Begin_Table

RAM Installed	Options Available
4MB (Standard)	None. You cannot access either PhotoGrade or duplex printing.
12MB	You can enable either PhotoGrade OR duplex printing.
20MB	You can enable both PhotoGrade and duplex printing. Duplex printing is available up to to US letter.
24MB and greater	You can enable both PhotoGrade and duplex printing. Duplex printing is available for all paper sizes including US legal.

End_Table

NOTE:

Additional memory also enables you to download additional fonts and provides greater document caching.

LaserWriter 12/640 PS: Image Interference w/ FinePrint ON (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 12/640 PS: Image Interference w/ FinePrint ON (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

I have a LaserWriter 12/640 PS printer which sometimes prints strange lines on my Images. I do not notice this problem in the text areas, only on the images. Why?

DISCUSSION -----

Sometimes you will get these unwanted interference lines when you have FinePrint ON and you are printing images. FinePrint is designed for text, not images. By default FinePrint is OFF. To get rid of these interference lines, make sure FinePrint is turned OFF.

Revised: 6/17/96
Security: Everyone

LaserWriter 12/640 PS: Memory Configurations (6/96)

Article Created: 13 June 1996

TOPIC -----

This article contains the possible memory configurations of the LaserWriter 12/640 PS printer.

DISCUSSION -----

The LaserWriter 12/640 PS printer ships with 4MB of RAM. Installing additional memory provides additional features.

Begin_Table

+=====+	
RAM Installed	Options Available
+=====+	
4MB (Standard)	None. You cannot access either PhotoGrade or duplex printing.
+-----+	
12MB	You can enable either PhotoGrade OR duplex printing.
+-----+	
20MB	You can enable both PhotoGrade and duplex printing. Duplex printing is available up to to US letter.
+-----+	
24MB and greater	You can enable both PhotoGrade and duplex printing. Duplex printing is available for all paper sizes including US legal.
+-----+	

End_Table

Note:
Additional memory also enables you to download additional fonts and provides

greater document caching.

RAM Upgrade Specifications
=====

To increase the printer's RAM, purchase SIMMs with the following specifications:

SIMM Dimensions

Length: 107.95 mm +/- 0.20 mm (4.25 in. +/- .008)
Height: 25.53 mm (1.005 in.) maximum

SIMM Sizes and Speeds

Begin_Table

+=====+			
SIMM Size	Configuration	Speed	Connector type
+=====+			
4 MB SIMM	1 M X 32 bit	70 ns or less	72-pin
	(one 4 MB bank)		
+-----+			
8 MB SIMM	2 M X 32 bit	70 ns or less	72-pin
	(two 4 MB banks)		
+-----+			
16 MB SIMM*	4 M X 32 bit	70 ns or less	72-pin
	(one 16 MB bank)		
+-----+			
32 MB SIMM*	8 M X 32 bit	70 ns or less	72-pin
	(two 16 MB banks)		
+=====+			

End_Table

Note:

* Must have a 2 KB row (11 bit x 11 bit) refresh configuration. 16 MB SIMMs with a 4 KB row (10 bit X 12 bit) refresh configuration are not compatible with the printer.

Installing RAM
=====

Your printer comes with 4 MB of RAM installed in Bank A/B. The table below lists RAM configurations you can use.

Begin_Table

+=====+			
Amount of Memory	Bank C/D	Bank A/B	
(megabytes)	(left slot)	(right slot)	
+=====+			

4 MB	0 MB	4 MB	
+-----+	+-----+	+-----+	+
8 MB	4 MB	4 MB	
	+-----+	+-----+	+
	0 MB	8 MB

LaserWriter 8.4: PostScript Fax Isn't Supported (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 8.4: PostScript Fax Isn't Supported (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

I have a LaserWriter Select 360 with the fax option. I am currently using the LaserWriter 8.2.3f printer driver. I noticed there is now a LaserWriter 8.4 printer driver. Can I use this software?

DISCUSSION -----

PostScript fax support is not supported with the LaserWriter 8.4 printer driver. In order to retain full support of the fax functions, you must continue to use the LaserWriter 8.2.3f printer driver. If you use the latest 8.3.x printer driver (8.3.4), you have limited functionality when faxing documents. In order to maintain the highest level of functionality, Apple recommends using the LaserWriter 8.2.3f printer software with all LaserWriter fax devices.

LaserWriter 8.4: PostScript VM Errors (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 8.4: PostScript VM Errors (6/96)

Article Created: 13 June 1996

TOPIC -----

I am using the LaserWriter 12/640 PS printer, and printing a complex document. However, when I try to print the document I keep getting a single page with some printing that says something about a PostScript VM Error.

I tried printing the document on a different LaserWriter and it printed properly. Why?

DISCUSSION -----

When printing very complex documents with multiple fonts and graphics you may see this. This is related to the LaserWriter 8.4 printer driver, which ships with the LaserWriter 12/640 PS printer.

There are a few things you can do that will help when using the LaserWriter 8.4 printer driver.

- Reduce the number of fonts used in the document.
- Turn ON Unlimited Downloadable Fonts in a Document
- Use a previous version of the LaserWriter driver (8.3.4 is the latest version of the 8.3.x driver).

LaserWriter 8.4: Obtaining Third-Party PPD Files (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 8.4: Obtaining Third-Party PPD Files (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

This article discusses issues that may arise using the LaserWriter 8.4 printer software with non-Apple printers.

DISCUSSION -----

If you use the LaserWriter 8.4 printer software with third-party printers (non-Apple printers), many of the enhancement options offered by these printers, such as resolution enhancement smoothing, do not work. In some cases you may not even be able to print with the existing vendor supplied PPD file.

In order to print to a non-Apple printer using the LaserWriter 8.4 driver, you should contact the vendor of the printer to obtain a LaserWriter 8.4 compatible PPD file.

You can also use the Generic PPD file, however you will not have all of the printer options available to you.

LaserWriter 8.4: Trouble Printing Documents in Foreground (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 8.4: Trouble Printing Documents in Foreground (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

I am using the LaserWriter 8.4 printer software, and when I print from several of my applications, the printing fails. Why?

DISCUSSION -----

The LaserWriter 8.4 printer driver offers both foreground and background printing. When you use foreground printing, the driver does not create a spool file on your hard disk, while this increases the printing time, this also causes printing problems with some applications. Applications known to have problems using foreground printing, there may be other applications as well, include Adobe Persuasion, Adobe Photoshop, Microsoft PowerPoint 4.0, Microsoft Excel 5.0, Intuit Quicken 6.0, Claris Draw, and Claris Impact.

To print properly from these applications, turn ON background printing in the print dialog.

LaserWriter 12/640 PS: White Streaks on Printout (6/96)

Revised: 6/17/96
Security: Everyone

LaserWriter 12/640 PS: White Streaks on Printout (6/96)

=====

Article Created: 13 June 1996

TOPIC -----

I am getting white streaks on my printouts from my LaserWriter 12/640 PS printer. How can I correct this?

DISCUSSION -----

You need to clean the mirror inside the LaserWriter 12/640 PS printer.

Cleaning the LaserWriter 12/640 PS Mirror
=====

Step 1

Open the printer cover.

Step 2

Remove the toner cartridge.

Step 3

Slide the yellow plastic square back and forth.

This removes any toner residue.

Step 4

Replace the toner cartridge.

Step 5

Close the printer cover.

Apple System Profiler 1.0.1: Read Me (6/96)

Revised: 6/14/96
Security: Everyone

Apple System Profiler 1.0.1: Read Me (6/96)

=====

Article Created: 14 Jun 1996

TOPIC -----

This article is the Apple System Profiler 1.0.1 ReadMe file.

DISCUSSION -----

About the Apple System Profiler

Apple System Profiler lets you gather information about the configuration of your computer. The information the Apple System Profiler reports is helpful if you place a call to the Apple User Assistance Center.

If you have one of the computers listed below, we recommend that you install Apple System Profiler on your machine now. Note that you MUST be running Mac OS version 7.5.2 or 7.5.3 to successfully install Apple System Profiler.

- Power Macintosh 9500, 8500, 8100, 7600, 7500, 7200, 7100, 6100, 5400, 5300 and 5200 series.
- PowerBook 5300, 2300 and 190 series.
- Macintosh Performa 6300, 6200, 6100, 5300 and 5200 series.

Apple System Profiler will only install on the computers listed above. Do NOT attempt to install it on any other computers.

To install, follow these steps:

- 1) Locate the Apple System Profiler Installer. It is in the same folder as this document.
- 2) Copy the Installer onto your startup disk. (To copy, drag the Installer icon to your hard disk.)
- 3) Double-click the Apple System Profiler Installer application.

You'll see a confirmation message when installation is complete. The Apple System Profiler is placed in the Apple menu. To use it, open the Apple menu and choose Apple System Profiler.

Drive Setup 1.0.5: ReadMe (1/97)

Revised: 1/20/97
Security: Everyone

Drive Setup 1.0.5: ReadMe (1/97)

=====

Article Created: 14 June 1996
Article Reviewed/Updated: 20 January 1997

TOPIC -----

This article contains the Read Me file for Drive Setup 1.0.5.

DISCUSSION -----

What's New in Drive Setup 1.0.5?

-
- * No changes to the SCSI driver.
 - * No changes to the IDE driver
 - * Updated Drive Setup application to assure that volume creation dates are different when creating multiple partitions on a hard drive. This change fixes a problem where, in rare cases, custom icons may appear incorrectly on a volume with multiple partitions with the same creation dates.

Drive Setup 1.0.5 requires System Software 7.5 or later and is only supported for use with the following systems:

- Power Macintosh systems (including PowerPC-based Performa systems)
- PowerPC-based PowerBook computers*
- Macintosh 580- and 630-series systems and PowerBook 190 series

Drive Setup does not currently support the Macintosh Processor Upgrade. If the upgrade is installed in a Macintosh 580- or 630-series system, use the "601 Processor Upgrade" control panel to turn the card off before using Drive Setup.

* The following computers are in the PowerPC-based PowerBook computer family: PowerBook 5300, 5300c, 5300ce, 5300cs, 2300c, 1400c, and 1400cs. Additionally PowerBook 200 and 500 series computers which have PowerPC upgrade cards installed are included in the PowerPC-based PowerBook computer family.

Article Change History:

Megaphone 1.0.3P: Read Me (6/96)

Revised: 6/14/96
Security: Everyone

Megaphone 1.0.3P: Read Me (6/96)

=====

Article Created: 14 June 1996

TOPIC -----

This article contains the ReadMe file for Megaphone 1.0.3P.

DISCUSSION -----

In order to use MegaPhone 1.0.3P, it is recommended that you also install Audio Volume Extension 1.1 and Telephone Manager 2.0. Look for these extensions in your Extensions folder inside the System Folder. If they are not installed, download the software from Apple SW Updates and install them before using MegaPhone.

MegaPhone 1.0.3P Info

This is the release of the 1.0.3 code base for Performas which has the same feature set as described for 1.0.2P. This version ships with the 5200, 5300, 6200, and 6300 desktop computers. All users of 1.0.2P can move forward to 1.0.3P.

Major problems addressed (in addition to those addressed for version 1.0.3):

1. For some users, on some calls, once the call was connected, MegaPhone would hang up. This is fixed.
2. For some users, the volume of the recorded messages was very low. The volume has been increased a little. (Some users are also able to fix this problem by adjusting the recording volume in the Telephone Setup control panel).
3. This version works with the Global Village TelePort Platinum V and the Global Village TelePort Gold IIv modems.
4. Users using pulse (rotary) dialing could not dial long distance numbers. This is fixed.

Installing MegaPhone 1.0.3P

This version of the installer will install all of the software components needed to run MegaPhone on your Macintosh Performa.

To install MegaPhone, double click on the file named "Install MegaPhone". Choose the hard disk you wish to install on, and then select the "Install" button. After you restart your machine, you can then launch MegaPhone. There will be a MegaPhone folder located inside your Applications folder.

QuickDraw 3D 1.0.6: Read Me (6/96)

Revised: 6/14/96
Security: Everyone

QuickDraw 3D 1.0.6: Read Me (6/96)

=====

Article Created: 14 June 1996

TOPIC -----

This article contains the ReadMe file for QuickDraw 3D 1.0.6.

DISCUSSION -----

Important Information About QuickDraw 3D

=====

QuickDraw 3D enables your Macintosh computer to display three-dimensional graphics using applications designed to take advantage of QuickDraw 3D. It also provides a common file format, called 3DMF (for "3D metafile"), for exchanging 3D documents, and acceleration services which support plug-and-play accelerator cards.

Installation

The following are required to install and run QuickDraw 3D:

- * a PowerPC based computer with a minimum of 16 megabytes of memory (RAM)
- * MacOS System 7.1.2 or later

Using QuickDraw 3D

The QuickDraw 3D folder includes the following applications, 3D models, and textures that allow you to explore the 3D capabilities of your Macintosh:

* SimpleText version 1.3.1 and Scrapbook version 7.5.1. These applications allow you to open and interact with 3DMF models.

* A new Scrapbook File with sample 3DMF models.

* A number of 3DMF models provided by Model Masters and Viewpoint Datalabs International.

* Textures provided by Wraptures and Xaos Tools.

You can expect more applications using QuickDraw 3D in the near future, including new versions of application programs you may already own. Contact your software vendors for more information about their plans to support this new technology.

QuickDraw 3D performance and image quality

For better performance, we recommend that Virtual Memory be turned off.

QuickDraw 3D has been optimized to display three-dimensional graphics of high quality. To display high-quality images, and obtain the best performance from your system, we recommend that you set your system to display thousands or millions of colors.

Troubleshooting

If you try to start an application that uses QuickDraw 3D and get the message "The application '<application name>' could not be launched because QuickDraw 3D could not be found," make sure that the following files are in the Extensions Folder, inside the System Folder:

- * QuickDraw 3D
- * QuickDraw 3D Accelerator
- * QuickDraw 3D Viewer

If the files are there and you still get the message, it means that you don't have enough memory to run the application. You may be able to open the application if you try the following:

- * Quit other open applications.
- * Reduce the amount of memory allocated to the application. This is done by:
 - selecting the application's icon in the Finder
 - choosing "Get Info..." from the File menu
 - typing a lower number in the boxes for Minimum Size and Preferred Size
- * Install more memory (RAM).

If you are using a localized system, and you install this U.S. software, you will need to copy the "Scrapbook File" in the "QuickDraw 3D Folder" to the System Folder on your Macintosh. Otherwise, when you select the Scrapbook from the Apple menu, you will get an empty scrapbook. Note that this operation will replace any existing Scrapbook File in the System Folder, thus erasing any previously stored contents.

Some of the sample models included with QuickDraw 3D, such as Big Ben and Red Hatchback, are highly detailed (they contain additional 3D modeling data such as vertex normals and surface UVs) and thus will require a larger amount of memory than the other supplied models. If you experience problems when opening these files from SimpleText, you should open only one file at a time.

How QuickDraw 3D uses memory

QuickDraw 3D is a shared library. When no applications that rely on QuickDraw 3D are open, the library does not take up memory space (RAM). Once a QuickDraw 3D-based application is open, the amount of memory taken up by the shared library doesn't increase if other QuickDraw 3D-based applications are launched. Of course, each application will take up memory according to their size and the complexity of the files being used. The memory taken up by QuickDraw 3D becomes available when you quit all QuickDraw 3D-based applications.

While a QuickDraw 3D application is open, the QuickDraw 3D library allocates memory from "temporary memory." This memory shows up in the "About This Macintosh..." window as memory used by the System. When you quit the application, the memory becomes available, but the size shown in the "About This Macintosh..." window may not reflect this. The memory previously used by QuickDraw 3D is, nonetheless, available for other applications (it is released to the applications as needed).

If you need to reinstall QuickDraw 3D

If you need to reinstall QuickDraw 3D, follow these steps:

1. Open the "QuickDraw 3D Install" folder and double-click the Installer icon.
2. After installing QuickDraw 3D, restart your computer.
3. If you want the items in the "QuickDraw 3D Extras" folder, drag the folder to the newly-created "QuickDraw 3D Folder" inside the "Apple Extras" folder.

Removing QuickDraw 3D

If you wish to remove QuickDraw 3D, follow these steps:

1. Open the "QuickDraw 3D Install" folder and double-click the Installer icon.
2. Choose Custom Remove from the pop-up menu.
3. Click the box next to each item to put a check in it.
4. Click Remove.
5. Restart your computer.

System 7.5 Update 2.0: Late Breaking Tips (1/97)

Revised: 1/29/97
Security: Everyone

System 7.5 Update 2.0: Late Breaking Tips (1/97)

Article Created: 14 June 1996
Article Reviewed/Updated: 29 January 1997

TOPIC -----

This article contains additional information for installing and using System 7.5 Update 2.0.

DISCUSSION -----

This document gives you some helpful information for installing and using System 7.5 Update 2.0 ("Update 2.0"). Since releasing Update 2.0, Apple has been monitoring our customers' experience with installing and using it. After receiving a significant amount of feedback on this software release, there is some helpful information that we can provide to ensure that the transition to the new version of System 7.5 goes as smoothly as possible.

1. Read the "Installing This Update" Read Me. It is very important that you follow the directions in this read me when you install Update 2.0.
2. Use Disk First Aid Make sure you use the Disk First Aid program to test and, if necessary, repair the disk on which you're going to install the update. On the CD, Disk First Aid can be found by using the path:

System 7.5 Update 2.0 Installation System 7.5 Update 2.0 System 7.5 Update 2.0 -
1 Utilities f Disk First Aid

On the floppy disks, Disk First Aid can be found on System 7.5 Update 2.0 - 1, in the Utilities folder. For instructions on using Disk First Aid, see the manual that came with your computer.

3. Update your hard disk driver. Make sure you update your hard disk driver to the latest version available. If you are using an Apple driver, both Apple HDSC Setup and Drive Setup are available with Update 2.0. Most 68K computers (the 68K computers that are exceptions are listed below) should use HDSC Setup. All PowerPC computers, and the following 68K computers that have IDE hard disks

should use Drive Setup:

Macintosh LC 580 Macintosh LC 630 Macintosh LC 630 DOS Macintosh Quadra 630 series computers Macintosh Performa 580 series computers Macintosh Performa 630 and 640 series computers PowerBook 150 series computers* PowerBook 190 series computers

Also, if you have a 68K computer and have installed a PowerPC Upgrade Card, you should use Drive Setup.

*Special note about the PowerBook 150 series computers: you do not need to update the driver on your computer (as described in the user's manual) with Drive Setup. (The driver on your computer is contained in it's ROM.)

On the CD, Apple HDSC Setup can be found by using the path:

System 7.5 Update 2.0 Installation System 7.5 Update 2.0 System 7.5 Update 2.0 - 1 Utilities f Apple HD SC Setup

On the floppy disks, Apple HDSC Setup can be found on System 7.5 Update 2.0 - 1, in the Utilities folder.

To use Drive Setup 1.0.4, from either the CD or the floppies, you must first custom install it. This can be done by opening the System 7.5 Update 2.0 Installer, and selecting Custom Install in the upper pop-up menu. Then open the triangle next to "Applications", and select "Drive Setup".

4. Use the Extensions Manager control panel to turn off all non-Apple extensions before installing the update. To do this, select "System 7.5 Only" if your current system software is 7.5 or 7.5.1, or "System 7.5.2" if your current system software is 7.5.2, then restart your computer. After the update is installed you can then go back and again use the Extensions Manager control panel to turn your extensions back on. See the "Installing This Update" Read Me for complete steps and information.

5. Do not rename or move files around within your System Folder before installing Update 2.0. The Installer makes some assumptions that certain files will be in certain places. If these files are moved or renamed, files that are installed could be placed in the wrong place, or not installed at all.

If you believe you have moved or renamed files, and are not sure how to move or rename them so that Update 2.0 will install correctly, then you should perform a clean install of the system software on your computer. For instructions on how to perform a clean install, see the manual that came with your computer .

6. If you have an AppleVision Display and you have problems after installing the Update 2.0, you should install AppleVision Fix 1.1. This software fixes such problems as:

- * When you press the buttons on the front of the display, you see a message that says "No AppleVision Display is connected."

- * You have a Power Macintosh 7200 and cannot find the Monitors & Sound control panel in the Control Panels folder.

- * The Monitors & Sound control panel does not have Geometry, Color, and Monitor

Sound buttons. (NOTE: The Monitor Sound button appears only if you have an AV monitor.)

* You can't change the resolution of the AppleVision Display or you can't open the AppleVision Setup control panel.

* Macintosh Guide does not contain information on the AppleVision Software or Display.

AppleVision Fix 1.1 can be found on the following online services:

* America Online - keyword: applecomputer

* CompuServe - GO APLSUP

* Internet -

- Worldwide Web: <<http://www.info.apple.com/swupdates>>

- ftp: <<ftp://ftp.info.apple.com>>

7. System 7.5 Update 2.0 will require more RAM, especially on PowerPC-based systems. The increased amount of RAM which System 7.5 Update 2.0 requires will vary greatly depending on which Macintosh system you are updating, and what your system configuration is.

According to tests run by Apple, the RAM reserved for system software for many 680x0-based Macintosh systems will increase less than 100K as compared to System 7.5.1, while the RAM reserved for system software for many Power Macintosh systems will increase 300K-850K as compared to 7.5.1. The results you will see may vary.

8. Use the following tips for these specific situations:

* Using Connectix RAM Doubler on a PowerBook. There is an incompatibility between System Software 7.5.3 and Connectix RAM Doubler and PowerBook computers. On PowerBook computers running System 7.5.3 and RAM Doubler, if you put the PowerBook to sleep and then wake it up, the machine may crash with a Type 8 error. Apple is currently working on this problem, and will have a solution available in the near future. In the meantime, there are two ways to workaroud this problem. First, the problem will not occur if MacsBug is installed. The MacsBug software can be found on the same on-line services listed above. The path to use is: Apple SW Updates: US: Macintosh: Utilities: MacsBug 6.5.3. Secondly, the problem will not occur if RAM Doubler is turned off.

* Using PCI PowerPC Computers with Ethernet. PowerPC-based computers with PCI slots might have a different physical Ethernet address after you install Update 2.0. The update fixes a bug that caused an incorrect physical Ethernet address to be used in environments where TCP/IP addresses are obtained using BootP, DHCP, or RARP. To see the new Ethernet address after you install the update, open the File menu in the AppleTalk or TCP/IP control panel and choose Get Info. If you install the update and are no longer able to use your TCP/IP-based applications, contact your network system administrator. If you have access to the Internet, detailed information regarding this issue can be found in the article "System 7.5.3 and Physical Ethernet Address Change" in the Technical Information Library. The Apple Technical Information Library (TIL) is available on the Internet at <http://www.info.apple.com/til.html/>.

Apple will continue to monitor any other feedback that we receive from customers using System 7.5 Update 2.0 and provide more information as appropriate.

AppleSearch Server 1.5.1 Patch Read Me (6/96)

Revised: 6/17/96
Security: Everyone

AppleSearch Server 1.5.1 Patch Read Me (6/96)

=====

Article Created: 17 June 1996

TOPIC -----

The following article is the ReadMe document for the AppleSearch Server 1.5.1 patch.

DISCUSSION -----

Warning

This patch cannot work properly while virus detection software is running. Please make sure that you have disabled any virus detectors before applying the patch.

About this patch

This program will patch the AppleSearch Server application (version 1.5) to enable WAIS gateway functionality with Open Transport. If you are not using Open Transport, it is not necessary to apply this patch. The version of the application will be updated to 1.5.1 after the patch is applied. All other AppleSearch component version numbers will remain 1.5.

This patch application was made with ResCompare, a free resource comparison and patch generation utility. ResCompare can be FTP'ed from most Macintosh archive sites. Send e-mail inquiries regarding ResCompare to Michael_Hecht@mac.sas.com.

LaserWriter 8.4: Read Me Document (1/97)

Revised: 1/17/97
Security: Everyone

LaserWriter 8.4: Read Me Document (1/97)

=====
Article Created: 14 June 1996
Article Reviewed/Updated: 17 January 1997

TOPIC -----

This article contains the LaserWriter 8.4 Readme document.

DISCUSSION -----

About Your Apple LaserWriter Printer Software for the Mac OS

This document contains some important reminders and some information about your Apple LaserWriter Printer Software for Mac OS-based computers. You may want to print this document and keep it for future reference. The topics are:

- Desktop PrintMonitor Version 2.0
- Apple Printer Utility Version 2.1
- LaserWriter 8 Printer Driver Version 8.4

Desktop PrintMonitor Version 2.0

New Features in Version 2.0

- Desktop printer icons can be moved off the desktop and into folders.
- A printer menu located on the right-hand side of the menu bar provides a convenient means to switch the user's default printer (custom install).
- A control strip module with functionality identical to the printer menu is provided for PowerBook systems and other systems employing the Control Strip software.
- Enhanced user interface.

Hints and Shortcuts

- The Desktop Printers folder in the Apple Menu provides a convenient shortcut to desktop printers. This is especially helpful if you have moved your desktop printer icons off the desktop.
- Command-L key combination is a shortcut equivalent to the Set Default Printer command in the Printing menu.
- Holding down the Option and Shift keys makes the Hold and Resume buttons function as Stop Print Queue and Start Print Queue.
- To print additional copies of a file, you can select the spool file waiting in the print queue and choose Duplicate from the File menu.

Creating Desktop Printers

To create a desktop printer, select a printer in the Chooser and click the Create/Setup button. If you have System 7.5 or later, you can create multiple desktop printers from within the Chooser, but if you're running an older version of system software, you can only create one desktop printer per Chooser session.

System Software Requirements for Desktop Printing

Desktop printing requires System 7.1 or later of the Macintosh Operating System (Mac OS). If you have System 7.0 or earlier and you want to use desktop printing, you can upgrade your Mac OS-based computer to use a later version of system software. Contact your Apple-authorized dealer.

Using Desktop PrintMonitor on a Non-English System

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an earlier version of the PrintMonitor. Later versions of the PrintMonitor are not replaced.) You have three choices:

- Use PrintMonitor 7.1.2 (or a later version).
- Obtain a set of installation disks for the printer software in the language of your system software from your Apple-authorized dealer and install it.
- Upgrade your system software to System 7.5.1 and install the printing software again. An English language version of the Desktop PrintMonitor software is installed.

Using the Desktop Printer Menu and the Printer Selector Control Strip

The desktop printer menu extension can be installed using the Custom Install option.

The Desktop Printer menu appears on the right-hand side of your menu bar. It will normally appear to the immediate left of the Guide menu. The Desktop Printer menu lists the names of all active desktop printers. A check mark is displayed next to the name of the default printer. Selecting the name of a printer from this list makes the printer the new default.

The Printer Selector control strip module is installed only on computers that already have control strip software installed. The Printer Selector adds an

item to the control strip that provides functionality identical to the Desktop Printer menu.

Support and Compatibility Information

- Some third-party printers do not support desktop printing. If your printer is not an Apple product, and no desktop printer icon is created after you select your printer in the Chooser, it is likely that your printer does not support Desktop PrintMonitor. Please contact the vendor of your printer to see if there is a version of the driver that is compatible with Desktop PrintMonitor.
- When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.
- Desktop PrintMonitor supports drag-and-drop printing for all files that cause the Print Command in the File menu to become enabled. Since clipping files do not enable the Print command, drag and drop printing is not supported for them.
- Apple's Fax Sender software is not supported by Desktop PrintMonitor. Fax Sender is fully functional when Desktop PrintMonitor is installed, however, it does not get the benefit of Desktop PrintMonitor's features. When you select Fax Sender in the Chooser you will not have a default desktop printer until you choose a printer icon and select "Set Default Printer" from the Printing menu.
- Spool files and desktop printers must use the same version of the LaserWriter 8 driver. You may encounter errors if you drag spool files that were created with one version of LaserWriter 8 to a desktop printer created with another version of the LaserWriter 8 driver.

Tips for Desktop Printing Troubleshooting

Error message "-192" or "15"

- Problem: After installing Desktop PrintMonitor and restarting your Mac OS computer you see error messages "-192" or "15" when you try opening files or folders in the Finder. This may occur when Now Startup Manager's preferences file has become corrupted.

Solution: Restart your computer with extensions disabled (hold down the Shift key while restarting), delete Now Startup Manager's preferences file, and restart the computer again with extensions enabled. Important: Before deleting your Now Norton Startup preferences, you may want to record them or write them down before you delete this file.

Desktop printer cannot be found

- Problem: When you try to print, your spool files are moved to the Trash and an alert is displayed saying that the desktop printer could not be found.

Solution: There are two likely solutions to this problem. First, it is possible that your desktop printer has somehow become damaged. To fix this, drag the

desktop printer icon to the Trash and reselect the printer in the Chooser. A new desktop printer icon will be created.

Second, your printer software may not be using a file format that is completely compatible with Desktop PrintMonitor. If your printer software is not published by either Apple Computer or Adobe Systems, it is possible that it is not making proper and legitimate use of PrintMonitor. If this is the case, your printer software will not work properly with Desktop PrintMonitor. The only resolution to this problem is to disable Desktop PrintMonitor and use old PrintMonitor. To print the documents you were working on follow these steps:

1. Empty the Trash.
2. Go to the Chooser and turn off background printing.
3. Print documents again.

To correct desktop printing:

4. Drag the desktop printer to the Trash.
5. Go to the Chooser and turn background printing back on.
6. Create a new desktop printer.

Not enough memory message when dragging files to desktop printer

- Problem: When you drag documents created by different software applications to your desktop printer icon, a message is displayed indicating that there is not enough memory to continue.

Solution: You may not have enough memory available to launch all of the software applications corresponding to the documents you have selected. You can resolve this situation by printing your documents individually or in smaller groups.

Options dimmed in Printing menu

- Problem: "Get Printer Info" and "Change Setup" appear in your Printing menu, but can't be selected.

Solution: These are two new functions supported by LaserWriter v8.4. If these or other items in the menu appear dimmed and cannot be selected, it is because you are using a version of the printing software that doesn't support their respective functions.

Apple Printer Utility Version 2.1

The Apple Printer Utility program works with all Apple PostScript Level 2 printers.

Printing the Font Sample List

Duplicate fonts in the printer's ROM, RAM or hard disk, may not print on the font sample sheet and font totals may be incorrect. However, these fonts are available and will print correctly on any documents printed by the user. Note: the hard disk option is not available for all Apple printers.

Working with a Large Number of Downloaded Fonts

If you plan on working with a large number of downloaded fonts, you will need to increase the memory allocation for the Apple Printer Utility. To do this, quit the Apple Printer Utility, select its icon and choose Get Info from the File menu. Increase the memory in the Preferred Size box, then close the Get Info window. The amount of memory required grows dynamically as the number of fonts in the printer increase. Increase the Apple Printer Utility's Preferred Size memory by 100K to 500K and try printing again.

Working with Kanji Systems

The script mode changes to Kotoeri when clicking into an input field. To recover from this problem select a one-byte script from the script menu in the upper right corner of the screen.

Working with Kanji/Japanese Fonts

Downloading Kanji fonts is not a supported feature of this software and program errors may occur. Increase the Apple Printer Utility's Preferred Size memory by the size of each Kanji font you want to download.

Downloading PostScript Fonts on a GX System With the Apple Printer Utility

When GX is installed, any PostScript fonts (often called Type 1 fonts) in the Fonts folder are converted to GX fonts, and the original PostScript fonts are copied to a new folder called •Archived Type 1 Fonts• which is created in the System Folder. If you want to download these fonts to your printer using the Apple Printer Utility, you must send the fonts in the •Archived Type 1 Fonts• folder, not the GX-converted versions in the Fonts folder. Downloading GX fonts that were not previously Type 1 fonts and converted by GX works correctly.

Removing Fonts From a Hard Disk Attached to a Printer

This paragraph is relevant if you are using a printer that will have a hard disk drive attached to it. The LaserWriter 12/640 PS does not support a hard disk drive attachment.

If a font is downloaded to both the printer's RAM and the printer's hard disk with the same name, and you remove the font on the hard disk, the RAM font will also be removed. If you remove the RAM font, the font on the hard disk will not be removed.

LaserWriter 8 Printer Driver Version 8.4

The software includes version 8.4 of the Apple LaserWriter 8 printer driver, which works with many Apple LaserWriter printers. This section contains information about LaserWriter 8 and information on using it with several of the printers.

What's New in Version 8.4

LaserWriter 8.4 provides a new user interface that is simpler and easier to use.

It also provides single-pass printing for foreground print jobs, more background printing options, and more layout options.

Larger Print Area

Some printers support both US Letter and US Letter Small paper sizes. To prevent text from clipping or wrapping to the next line on different printers, use US Letter Small. To get the widest possible margins from your printer model, use US Letter.

Using PostScript Fax

PostScript Fax is an option for the LaserWriter Select 360, the LaserWriter 16/600 PS, and the LaserWriter Pro 810. If you use a PostScript Fax option with any of these printers, you should use LaserWriter 8f version 8.2.3f. PostScript Fax is no longer supported with LaserWriter drivers 8.3.x and beyond. See the section "How To Get Updated Printer Software" at the end of this Read Me for information on obtaining LaserWriter 8f version 8.2.3f if you don't already have it.

Using Color Matching

When ColorSync 2.0 is installed and the ColorSync Profiles folder contains printer profile(s), there are two options in addition to color/grayscale output:

- PostScript Color Matching/Printer's Default is the preferred color-matching choice. When you are printing to a PostScript Level 2 printer, and it is efficient to let the printer do most of the work, this option is a good choice.
- ColorSync Color Matching is an alternative color-matching selection. It invokes the ColorSync system software to perform color matching for the printed document, matching your monitor and printer's profile and sending the correct color information to the printer. With ColorSync Color Matching, most of the work is done by your Macintosh.

Here are some tips on using color matching:

- Color output will vary depending on the application you are using.
- Documents that use ColorSync 1.0 embedded profiles convert to the profile set up in the ColorSync 2.0 System Profile control panel.
- When you print with PostScript Color Matching selected and ColorSync 2.0 is not installed, the driver uses the Apple 13" RGB Standard profile.
- Application programs that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT file corrects the problem.

PPD Files

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to

determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, you need to go through a simple setup procedure. When selecting your printer for the first time, or after installing an additional option, click the Create/Setup button in the Chooser. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

If you get an error about the preferences file when you choose an option that is specific to your printer, you may have an outdated PPD file. You should contact the vendor of your printer for an update.

Creating EPS Files

You can create an encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

- Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, you may create an extremely large file.
- If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.
- When you create EPS files with preview information included, other programs that create their own PostScript code may not display the EPS file accurately on the screen.

Using the LaserWriter 8 Driver With the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.5.1 or later.

Using QuickDraw GX Fonts on a non-QuickDraw GX System

If you are using the QuickDraw GX versions of the fonts Hoefler Text or Skia with a non-QuickDraw GX system, you may encounter line-layout problems on screen or with your print-outs.

Using the LaserWriter 8 Driver With Applications

Some programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that may result in printing problems. If you experience problems with an application, please contact the publisher of the program. In some cases a newer version of the program may be available.

..TIL20031-LaserWriter_8-4-Read_Me_Document_1-97_(TA21706).pdf

The following list describes some special cases that you should be aware of when working with some applications. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

- **Foreground vs Background Printing:** LaserWriter 8.4 offers both foreground and background printing. In foreground, LaserWriter 8.4 doesn't spool the file being printed. An application may fail when printing in the foreground if the application assumes the driver will make a spool file.

When printing in the foreground you may experience problems with these applications: Persuasion, Photoshop, PowerPoint 4.0, Excel 5.0, Quicken, PageMaker 6.0, ClarisDraw, and Claris Impact.

If you experience problems with foreground printing, change to background printing and try again.

- Color output will vary depending on the application you are using.
- With many application programs, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.
- Some programs may print in color even when Black and White mode is selected.
- Programs that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT corrects the problem.
- **Tray Selection:** Applications that don't utilize LaserWriter 8.4's new capabilities have some limitations with tray selection when printing from Finder. To work around these problems, print from within the application and contract the vendor of the application.

Adobe Acrobat 2.1

- Acrobat retains the settings used for one printout and applies these settings to subsequent print jobs, unless options are reset by the users.

Adobe Illustrator 5.5

- Multiple-page documents may not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

Adobe Type Manager 3.9

- Documents may sometimes generate PostScript errors when printing outline fonts from a Macintosh 9500 using ATM 3.9. This can be fixed by replacing ATM 3.9 with an earlier version.

Aldus Freehand 4.0 & Freehand 5.0

- Documents do not print correctly when you choose a page layout from the

Layout pop-up menu in the Page Setup dialog box.

Aldus PageMaker 5.0

- Documents that have been set up using a page layout from the Layout pop-up menu may not print correctly with the Print-Option command; use the Print command with PageMaker's Thumbnail option.
- When using a page layout from the Layout pop-up menu with the Print-Option command, the document will be printed in reverse order.
- Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
- You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus SuperPaint 3.5

- Rotated or filled polygons print as solid gray objects.
- Gradient fills may not print when copied into other programs.

Canvas 3.5.2

- When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if you use the Geneva, New York, or Monaco fonts.

ClarisDraw 1.0

- Some shapes that contain gradients may not print correctly.

CricketPresents 2.1

- You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

DeltaGraph Pro 3.0.4

- Printing with Unlimited Downloadable Fonts may cause some elements to be shifted and fonts to substitute Courier.

FileMaker Pro 2.1

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Informed Designer/Manager 1.4.2

- Do not print documents that contain JPEG images in Black and White mode; your system will restart.

- When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

MacDraw Pro 1.5

- Rotated text within a frame that is placed in another application may not print correctly.

Microsoft Excel 5.0

- Colored horizontal cell borders will often not appear in the printout. This happens with any color printing option and on most printers.
- When you select Page Setup, Excel displays its own dialog box. Click the Options button to open the Page Setup dialog box generated by the LaserWriter driver. Most of the settings in Excel's window match the corresponding option in the driver's window. However, the scaling size may be different in the two dialog boxes. The size displayed in the Excel window is the size that will be used when you print from Excel.

Microsoft PowerPoint 3.0

- Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0

- Printing documents that have rotated objects with rounded corners results in a PostScript error.

Microsoft Works 4.0

- Works 4.0 color print outs may not match what appears on your screen. Experiment with the color options to determine which one generates the best printout for your needs.

Microsoft Word 6.0

- Each section of a document is treated as a separate file when printed.

Netscape 2.0.1

- Netscape may print a pale gray background to an older LaserWriter printer.
- When printing a multiple-page document, Netscape may print below the margins on the intermediate pages.
- Graphics that seem to be transparent on screen will be printed on your documents.

Painter 3.0

- When you print using the Invert option, images do not print inverted correctly.

QuarkXPress 3.3.1

- Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- Some imported JPEG files may not print correctly.

RagTime 3.2

- You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0

- Use ReadySetGo! version 6.0 or later with the LaserWriter 8 printer driver; earlier versions will not work.
- With the Unlimited Downloadable Fonts option selected, you may not be able to print complex documents.
- Documents that use pen patterns will print patterns as solid gray.

How to Get Updated Software

Apple Software Updates are available on CompuServe (GO APLSUP), America Online (keyword: applecomputer), and on the Internet at:

- US, WWW site: <<http://www.info.apple.com/swupdates>>
- US, FTP site: <<ftp://ftp.info.apple.com>>
- Europe, FTP site: <<ftp://ftp.info.euro.apple.com>>

LaserWriter 8.4: Apple LaserWriter Printer Tips (10/96)

Article Created: 14 June 1996
Article Reviewed/Updated: 15 October 1996

TOPIC -----

This article contains the Apple LaserWriter Printer Tips file, which ships with the LaserWriter 8.4 software.

DISCUSSION -----

Apple LaserWriter Printer Tips
=====

This document contains some information and tips for achieving the best results with your printer. When using the LaserWriter 8 driver, you should be aware of the following situations. Some happen with all LaserWriter printers, and others happen only with specific models.

All LaserWriter Printers

- Some printers support both US Letter and US Letter Small paper sizes. To prevent text from clipping or wrapping to the next line on different printers, use US Letter Small. To get the widest possible margins from your printer model, use US Letter.
- Some printers with small amounts of memory will not print documents containing large numbers of fonts. If a document using multiple fonts doesn't print using the LaserWriter 8 driver, try selecting Unlimited Downloadable Fonts in the Page Setup PostScript Options dialog box and print again. Alternatively, try power-cycling the printer and printing the document again.
- If you encounter a timeout (PostScript error -8993) when printing multiple copies of large and complex documents in the background, print the documents one at a time or select foreground printing to avoid this problem.

Apple LaserWriter 12/640 PS Printer

Obtaining Printer Supplies for the Apple LaserWriter 12/640 PS

To order printer supplies for the LaserWriter 12/640 PS direct from Apple, call 1-800-600-7805. For your reference, the part numbers are listed below:

M4683G/A LaserWriter 12/640 PS Toner Cartridge
M4682G/A LaserWriter 12/640 PS 500-Sheet Cassette and Feeder
M4680G/A LaserWriter 12/640 PS Envelope Cassette
M4697G/A LaserWriter 12/640 PS Duplex Printing Unit
M4698G/A LaserWriter 12/640 PS Face-Up Output Tray

For the location of the nearest Apple-authorized dealer, call 1-800-538-9696, extension 525.

Printer Memory Requirements

The printer comes with 4 megabytes (MB) of memory. If you will be using PhotoGrade or the optional duplex printing unit, you will need to add memory. The printer uses SIMMs that can be purchased from many electronics and computer outlets. See "RAM upgrade specifications" in Appendix D of your user's manual for more information.

Total memory requirements for the possible configurations that require additional memory are:

- PhotoGrade - 12 MB
- Duplex Printing Unit - 12 MB
- PhotoGrade and Duplex Printing Unit for all paper sizes except legal - 20 MB
- PhotoGrade and Duplex Printing Unit for all paper sizes - 24 MB

Using PhotoGrade and the Duplex Printing Unit

If your printer has at least 12 MB of memory but less than 24 MB, you cannot always use PhotoGrade and the duplex printing unit at the same time (see "Printer Memory Requirements" above). If you select two-sided printing with PhotoGrade, and PhotoGrade cannot be used at the same time, two-sided printing will override PhotoGrade.

About the Duplex Printing Unit and the Multipurpose Tray

The LaserWriter 12/640 PS does not allow the multipurpose tray to be used with the duplex printing unit. The printer driver user interface provides a user interface switch that allows you to switch between the multipurpose tray and two-sided printing. If you have the multipurpose tray selected, two-sided printing is disabled. If you want to use two-sided printing, select a tray other than the multipurpose tray, then make your two-sided printing selection. Similarly, if you have two-sided printing selected, you must deselect it before the user interface allows you to select the multipurpose tray.

About Paper Jams and the Multipurpose Tray

If you are printing from the multipurpose tray and your printer jams, check that you are specifying the correct paper size in your page setup. The printer may

jam if you select the multipurpose tray and have the wrong size paper in the multipurpose tray for the job that you are printing.

Using the Envelope Feeder

By default, the multipurpose tray takes priority over the envelope feeder. However, if the multipurpose tray is set to the same paper size as the envelope feeder, the printer will pull the paper from the multipurpose tray instead of the envelope feeder.

Use one of these methods to have the printer use the envelope feeder as the paper source:

- Pick the envelope tray as the paper source in the Print dialog. The envelope tray is identified as "Envelope Feeder/".
- Set the multipurpose tray to a size other than the desired envelope size using the Apple Printer Utility.
- Make "Cassette (Optional)" Installed and Preferred by clicking on the printer's icon and then selecting Change Setup from the Printing menu.

Using RARP with Subnet Mask and Default Gateway

This note is applicable if you will be printing from a UNIX computer using TCP/IP.

When the printer uses RARP to determine its IP address, it ignores any defined values for the subnet mask and default gateway.

You cannot use RARP for regular IP address configuration. RARP can be used once when the printer is initially configured, to set an IP address long enough to connect to the printer via telnet. Then, with telnet set the IP address, subnet mask, and default gateway.

Apple Color LaserWriter 12/600 PS Printer

This section provides additional information on using the Color LaserWriter 12/600 PS Printer.

About the Demonstration Page

When the power is turned on, the Color LaserWriter 12/600 PS automatically prints a startup page and a demonstration page. For legal and B5 paper sizes, only the startup page prints; the demonstration page is not printed. You can use the Apple Printer Utility to turn off the printing of the startup and demonstration pages.

About the Apple Color LaserWriter 12/600 PS Status Panel

As described in the Color LaserWriter 12/600 PS manual, Appendix G, the status panel lights aid in indicating hardware service problems found during printer startup. If the Alert light is flashing and all the door lights are flashing, check all the printer doors; one of them is open. If the Paper Out and Paper Jam lights are blinking alternately, a hardware problem has been detected. To identify the problem, notice which toner lights (C, M, Y, Bk) and how many of

the maintenance lights (in the area on the right-hand side of the status panel) are on, and refer to the table below. Each area listed under "Problem" represents a general circuit area for the service technician to investigate, not necessarily the exact cause of the problem.

If you have an external SCSI hard disk drive attached but don't turn it on before you turn on the printer's power, the printer may indicate a hardware failure. To correct the problem, turn the hard disk drive on and restart the printer.

Obtaining the Best Results for Business Graphics

To obtain the best results for business graphics, colors should be 100% saturated. For example, to print pure yellow, define yellow as 100% red and 100% green without any blue. Then print your document, selecting the Color/Grayscale option in the Print Options dialog.

Printing on Legal-Size Paper

In the standard memory configuration, the Color LaserWriter 12/600 PS uses a higher compression technique for legal-size paper using only the cyan, magenta, and yellow colors. As a result of this compression technique, very complex pages may show missing pixels in fine lines or small text, "jaggies" (edges with low-resolution appearance), and color changes. To improve the image quality of such pages, you can increase the printer's memory to 16 MB or more. With at least 16 MB of printer memory, the Color LaserWriter 12/600 PS can achieve the same quality with legal-size pages as with letter and A4 sizes using all four colors (cyan, magenta, yellow, and black.)

Printing Images on the Color LaserWriter 12/600 PS Printer

The Color LaserWriter 12/600 PS Printer's highest resolution for printing images is 150 x 150 dpi. No gain in image quality is achieved if higher resolution images are used. All other types of documents print at 600 x 600 dpi.

Avoiding Hue Shifts When Printing to File

When you save an image in an Encapsulated PostScript (EPS) file all the PostScript settings relating to the original output device in effect are saved along with the image data. When the image is printed later, the settings that were in effect may cause major hue shifts. To prevent these hue shifts save the image in TIFF format instead of EPS.

The Density Control Panel

The Color LaserWriter 12/600 PS has been adjusted at the factory to produce the best possible image quality. However, small variations exist among different printers. To make subtle changes to image quality, you can use the Density Control Panel on the back of the printer. NOTE: If changing the settings produces inferior image quality, return to the factory settings by following these steps: Select each color using the Color Select button, then press the - or + button to move the indicator light to the center position. When the indicator is in the center, press Enter to make the setting permanent. Repeat

this procedure for all four colors.

Setting Your ColorSync System Profile for Best Printing Results

Before using ColorSync color matching to print to the Color LaserWriter 12/600 PS printer, set the ColorSync System Profile for the monitor connected to your system. To do this, open Control Panels in the System Folder and double-click ColorSync System Profile. Make sure the following settings are selected:

- Set the profile for the monitor connected to your system. For the best color match when printing, select the "page-white" or "D50" system profile for your type of monitor if one is available.
- For the best visual match between the colors on your monitor and printed colors, select the Page-White Gamma option in the Monitors control panel. To select a gamma option, open the Monitors control panel, then hold down the Option key while you click the Options button. In the Options window, click the Use Special Gamma checkbox to put an X in it. Then choose Page-White Gamma from the list.
- On a multiscan monitor, make sure that the color temperature, or intensity, is set to 9300K (the default setting). See the monitor manual for instructions. If the Page-White Gamma option is selected with a color temperature other than 9300K, your monitor colors could look too red or too blue compared to printed colors.

Obtaining Printer Supplies for the Apple Color LaserWriter 12/600 PS

To order printer supplies for the Color LaserWriter 12/600 PS direct from Apple, call 1-800-600-7805. For order numbers, see Appendix A of the printer manual:

- toner cartridges
- transparencies
- photoconductor cartridge (includes toner disposal boxes)
- fuser oil
- fuser

Instructions for replacing the fuser are in Appendix F of the printer manual. Instructions for replacing other printer parts come in the new packages.

For the location of the nearest Apple-authorized dealer, call 1-800-538-9696, extension 525.

LaserWriter 16/600 PS

If Tray Switching is turned on and you have an optional 500-sheet feeder that contains the same size paper as the 250-sheet feeder, use the 500-sheet feeder as the preferred paper source for optimal printing performance. See the manual that came with your printer for instructions on selecting the 500-sheet feeder as the preferred paper source.

LaserWriter Pro 810

- With some graphics programs, bitmapped graphics printed with the Precision Bitmap Alignment option in the Page Setup PostScript Options dialog box will be reduced in size by 25%.

LaserWriter Pro 600 and 630

- When you print envelopes from the optional envelope feeder, you cannot use Auto Select as the Paper Source (in the Print dialog box).
- When you print at a resolution of 600 dots per inch (dpi), bitmapped images may appear with lines across the image. When bitmapped images are printed at 300 dpi, lines across the image do not appear.

LaserWriter II NT and II NTX

- If you select both the Smooth Graphics and the Invert Image options in the Page Setup PostScript Options dialog box, a PostScript error results.
- Do not use the B5 tray to print envelopes on a LaserWriter II NT. Use the letter tray instead.

LaserWriter IIg and IIx

- When you select paper sources from the First Page From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.
- The US Legal paper size has been changed on some LaserWriter IIx/IIg printers to be more compatible with other Apple LaserWriter printers. To prevent text from clipping or wrapping to the next line on different printers, use US Legal Small. To get the widest possible margins from your printer model, use US Legal.
- Some form-printing application programs cannot print forms using the Layout settings in the Layout dialog box.

DOS Compatibility Software Update 1.5 Read Me (6/96)

Revised: 2/17/97
Security: Everyone

DOS Compatibility Software Update 1.5 Read Me (6/96)

Article Created: 17 June 1996

TOPIC -----

The following article is the ReadMe document for the DOS Compatibility Software Update.

DISCUSSION -----

Important Information About the DOS Compatibility Software Update
=====

Contents

- Introduction
- What's included with the DOS Compatibility Software Update
- System Software Compatibility
- Additional Information

Introduction

=====

The DOS Compatibility Software Update is a set of software enhancements that improves the reliability and performance of the following:

- Power Macintosh 6100 DOS Compatible computer
- Macintosh Performa 6100 DOS Compatible computer
- Macintosh Performa 630 and 640CD DOS Compatible computers
- Macintosh LC 630 DOS Compatible computer

This update also works with any Power Macintosh 6100 or Macintosh Performa 6100 series computer that has a DOS Compatibility Card installed.

IMPORTANT: If you are using a PC Compatibility Card with any Macintosh that has a PCI expansion slot, you do not need to install this update.

What's included with the DOS Compatibility Software Update

=====

- The "Disk Images" folder contains disk images that you can use to update your DOS Compatibility Software. The instructions for working with these disk images are in the online DOS Compatibility Card Software Update User's Manual.
- The "User's Manual" folder contains the DOS Compatibility Card Software Update User's Manual in Adobe Acrobat (PDF) format. To open this manual, you need Acrobat Reader, which is available for free on most online services and at the Adobe Systems World Wide Web site (<http://www.adobe.com>). If you ordered the DOS Compatibility Software Update on floppy disks, Acrobat Reader is already included. You can install it by double-clicking the ACROREAD.MAC icon in the Acrobat Reader folder.

System Software Compatibility

=====

If you are using a Power Macintosh or Performa 6100 series DOS Compatible computer, you can use Operating System 7.1.2 or 7.5.3 with the DOS Compatibility Software Update.

If you are using a Macintosh Performa 630, Quadra 630, or Performa 640CD DOS Compatible, you should use System 7.5.3 with the DOS Compatibility Software Update.

If you are currently using System 7.5, 7.5.1, or 7.5.2, you can install the System 7.5 Update 2.0 to update to System 7.5.3. You can order System 7.5 Update 2.0 on a CD or a high-density floppy disk set from the Apple Order Center by calling 1-800-293-6617. You can also download System 7.5 Update 2.0 from many online services or the Apple Support and Information World Wide Web site (<http://www.info.apple.com>).

LaserWriter Software Compatibility

If you are using System 7.1.2 with a Power Macintosh or Performa 6100 series DOS Compatible computer that is connected to a PostScript printer, you need to install the LaserWriter 8.3.3 software. You can download this software from an online service or the Apple Support and Information World Wide Web site (<http://www.info.apple.com>). If you ordered the DOS Compatibility Software Update on floppy disks, you already have this software in the "LaserWriter 8.3.3" folder.

If you are using System 7.5.3, you do not have to install LaserWriter 8.3.3 because System 7.5.3 already includes it.

Additional Information

=====

The rest of this Read Me file contains information that could not be included in the online DOS Compatibility Card Software Update User's Manual.

Configuring Sound Blaster Properly

To configure Sound Blaster properly for Windows 95, refer to "Sound Problems" in the troubleshooting chapter of the DOS Compatibility Card Software Update User's Manual. Otherwise, your system may crash when attempting to play 16-bit sounds.

Berkeley Systems After Dark for DOS

Do not use the After Dark screen saver for DOS in the PC environment. Once the screen saver activates, it is not possible to return to the PC environment.

Networking

If you are using System 7.5.3 with any of the Macintosh computer models listed at the beginning of this Read Me file, use the Network Software Selector to select the "Use classic networking" option, which is the default setting. Do not use Open Transport.

Shared Memory

Windows 95 performance will be much better on a 6100 series Macintosh computer if there is 8MB or more memory installed on the DOS Compatibility Card itself. Though the 6100 series Macintosh supports shared memory between the Macintosh and the DOS Compatibility Card, system performance will be better if you install memory directly on the DOS card instead of using the shared memory feature.

The updated DOS Compatibility software no longer supports shared memory with the Macintosh Performa 630 and 640CD DOS Compatible computers. If you removed the memory that was initially installed on the DOS Compatibility Card in one of these computer models, you must re-install the memory in order to use the new software.

Serial Port

The DOS Compatibility Card does not support Carrier Detect (CD). You must configure your communications applications so they do not use CD. Most communications applications can be set to respond to the CARRIER string sent back by most modems.

DOS Clipboard not Supported

The original DOS Compatibility Card software included a DOS Clipboard feature. This feature is no longer supported in the current software.

Power Macintosh or Performa 6100 Series DOS Compatible

Shut down a 6100 series DOS Compatible Macintosh before connecting a new monitor. (If you connect a monitor while this computer is running, you may not be able to configure the monitor properly in the PC Setup control panel. To correct the problem, shut down your computer and then restart.)

PowerTalk Mail Reader 1.1 Read Me (6/96)

Revised: 6/17/96
Security: Everyone

PowerTalk Mail Reader 1.1 Read Me (6/96)

Article Created: 17 June 1996

TOPIC -----

The following article is the ReadMe document for the PowerTalk Mail Reader 1.1.

DISCUSSION -----

Important Information About the PowerTalk Mail Reader Control Panel

System requirements

To use PowerTalk Mail Reader, you must use Macintosh system software version 7.5.3 or later. PowerTalk Mail Reader does not work with earlier versions of system software.

What is PowerTalk Mail Reader?

PowerTalk Mail Reader lets you select the application for reading standard AppleMail-type letters. After you use the reader to choose an application, that application opens all AppleMail letters you receive.

How to install PowerTalk Mail Reader

To use PowerTalk Mail Reader, drag its icon to your Control Panels folder and restart the computer. (The control panel takes approximately 15K of disk space, with an additional 1K for the MailReader Preferences file.)

How to remove PowerTalk Mail Reader

To remove PowerTalk Mail Reader, drag the PowerTalk Mail Reader control panel and the MailReader Preferences file (in the Preferences folder in the System Folder) to the Trash.

How to use PowerTalk Mail Reader

To use the PowerTalk Mail Reader, double-click its icon. Click Change. In the dialog box that appears, select the desired application.

To revert to AppleMail, click Select AppleMail.

Compatible AppleMail readers

AppleMail letters use a format called Standard Interchange Format (SIF). Any application that can read SIF can read AppleMail letters. The following applications read SIF:

- BBEdit 3.0
- ClarisWorks 3.0
- MacWrite Pro 1.5
- Microsoft Word 6.0
- Nisus Writer 4.0
- WordPerfect 3.0
- PowerMail 1.0

Some mail-reading applications also read other file formats. For example, some can read text and pictures, but not sound or movies. Contact the application's publisher for a complete description of its features.

PowerTalk Manager 1.5 Read Me (6/96)

Revised: 6/17/96
Security: Everyone

PowerTalk Manager 1.5 Read Me (6/96)

=====

Article Created: 17 June 1996

TOPIC -----

The following article is the ReadMe document for PowerTalk Manager 1.5.

DISCUSSION -----

This version of the PowerTalk Manager contains:

- A fix to a system freeze that may occur when opening a PowerShare Catalog from the PowerTalk Mailer.
- The new Mailbox API

PowerTalk Manager 1.5 is compatible with any system running PowerTalk version 1.1 or higher (compatible with System 7.5, 7.5.1, 7.5.2, and 7.5.3). PowerTalk Manager version 1.5 requires Open Transport 1.1 or higher.

To install the new PowerTalk Manager 1.5, follow these steps:

- 1) Open the Extensions folder in the System Folder
- 2) Drag the PowerTalk Manager that is in that folder to the Trash
- 3) Drag PowerTalk Manager 1.5 to the Extensions Folder in the System Folder
- 4) Reboot

Apple Network Administrator Toolkit Read Me (7/96)

Revised: 7/15/96
Security: Everyone

Apple Network Administrator Toolkit Read Me (7/96)

Article Created: 17 June 1996
Article Reviewed/Updated: 11 July 1996

TOPIC -----

The following article is the ReadMe document for the Apple Network Administrator Toolkit.

DISCUSSION -----

This document contains important information about the Apple Network Administrator Toolkit. Please read it carefully before you install or use the software.

Apple Network Assistant 2.0
=====

1. The Announce feature requires Ethernet network or another network of similar performance.
2. Certain workstations, such as the LC, LCII and PowerBook Duos, cannot support the Talk feature. An error message appears when you try to use the Talk command with these workstations.
3. If the Talk or Announce features are not working correctly on a workstation, make sure that the Sound Input option is set to a microphone. See your Macintosh user's manual for instructions on how to do this.
4. If you share a workstation screen with a workstation that has a smaller monitor, you will see only part of the shared screen.
5. If you share or observe a workstation screen that is running the Apple Video Player program, the TV signal will not appear on the other workstations.
6. The Share Screen and Announce commands work with up to 100 workstations at a

time.

7. With the Share Screen, Observe, and Control features, the higher the number of colors on a monitor or the higher the resolution setting for a monitor, the greater the time required to transfer information across the network.

8. If you plan on sharing a screen with several workstations, it is better to select all the workstations at once, then use the Share Screen command, rather than selecting the workstations incrementally.

9. You will not be able to use the Control, Observe, Share Screen, Announce, or Talk features with a workstation connected to the network via Apple Remote Access.

10. If you share a screen or copy files across a router, you may notice a decrease in performance, particularly when copying files to workstations on LocalTalk.

11. If you are using IRTalk, make sure both sides of the connection are running with either classic networking or with Open Transport networking.

12. If you use the Change Settings command to turn on file sharing on a workstation that does not have File Sharing software installed, you will not get an error message, even though file sharing will not be turned on. File sharing must be installed on a workstation for this command to work. Use the Software Version Report to verify that File Sharing software is installed on workstations.

13. If you are using the Copy Items command to copy files to an AppleShare file server and the server is busy, you may get an error message stating "Item in use." Wait until the server is not busy and try again.

At Ease for Workgroups 4.0
=====

Using the At Ease Administration program

14. If there is a single Administrator for the At Ease server and the password for this Administrator is lost or forgotten, it is possible to redefine the password by discarding the At Ease Preferences file on the At Ease server. (See the section "Administering At Ease" in Chapter 7, "Tips and Troubleshooting," in the At Ease section of the Apple Network Administrator Toolkit manual.) However, if you discard the At Ease Preferences file, information about approved volumes and approved desktop printers will be lost. You should use the Security menu in the At Ease Administration program to reestablish the list of approved volumes and the list of approved desktop printers. You should also edit each workgroup on the server and reestablish its data storage volume, the allowed desktop printers, and any volumes to be mounted at login.

Upgrading from version 2.0 or version 3.0

15. If you are upgrading from earlier versions of At Ease for Workgroups (2.x or 3.x) and you wish to use the "Lock Startup Volume" feature with version 4.0, follow these steps:

- Open the At Ease Administration program and choose System Settings from the Security menu. In the System Settings dialog box that appears, make sure that the option "Prevent users from bypassing security by starting up from a floppy disk" is NOT selected. Then quit the At Ease Administration program.
- Restart all At Ease workstations so they display the At Ease login screen. (You may wish to use Network Assistant to do this.)
- Open the At Ease Administration program again and open the System Settings dialog box. This time, SELECT the option "Prevent users from bypassing security." Quit the At Ease Administration program.
- Restart all the At Ease workstations again.

Improving security

16. Some newer Macintosh models running system software version 7.5.2 may allow users to bypass At Ease by holding down the Shift key at startup. To solve this problem, open the System Settings dialog box (using the Security menu in the At Ease Administration program) and make sure the "Don't allow Shift key at startup" option is selected. Alternatively, you can upgrade the workstations to system software version 7.5.3.

17. A user may be able to modify a document in a workgroup shared folder or a volume shared folder by opening it, changing the contents, and using the Save command. This can happen even if you have not given the user's workgroup permission to save to these shared folders. To prevent users from modifying a document in a shared folder, you can lock the document by opening the folder on the server, selecting the document, and choosing Get Info from the File menu. In the Info window that appears, click the "Locked" checkbox in the lower-left corner to put an X in it.

18. You can prevent workgroup members from opening applications from removable media by leaving the "Allow applications to be opened from removable media" option unchecked. (See the section "Setting Locations for a Workgroup" in Chapter 4, "Creating At Ease Users and Workgroups.") However, leaving this option unchecked does not prevent users from launching applications on CD-ROM discs. To prevent users from opening applications on CD-ROM discs, you can specify the exact CD-ROM discs and files on these discs a workgroup can use. (See the section "Defining Access to CD-ROM Discs" in Chapter 6, "Administering the At Ease System.")

19. At Ease administrators should be aware that the list of "allowed" applications, desk accessories, and control panels for a workgroup is created at login time when At Ease scans the workstation for

- all items for the current workgroup created by the At Ease

Administration program

- items in the Apple Menu Items folder (if the workgroup has access to it)
- the Chooser (if the workgroup has access to it)
- the Print Monitor
- items in the Startup Items folder (if the workgroup will launch items in this folder)
- items in the Shutdown Items folder
- items in the Control Panels folder (if the workgroup has access to it)
- approved sublaunched programs

If an application or an alias to an application exists in any of these locations, workgroup members will be able to open it (from the restricted Finder, for example) even if you did not give them permission to do so when you created the workgroup. Likewise, if a document exists in any of these locations, workgroup users will be able to open the application that created it without having explicit permission to do so.

Note that the user's own documents folder is not included in the list of scanned locations. (If it were, a user could copy any application from a floppy disk to this folder and open it.)

At Ease and the restricted Finder

20. The instructions in Macintosh Guide (available from the Guide menu in system software version 7.5 or later) may not work for users in the restricted Finder. For example, a user who requests instructions from Macintosh Guide on how to adjust the sound volume on his or her workstation will not be able to complete the required steps if the Administrator has not given him or her access to the control panels.

21. When a user in the restricted Finder inserts a floppy disk or has access to another local volume, any desktop items on that disk or volume are placed in a folder called Items for Desktop. When the user ejects the disk or unmounts the volume, the items remain in this folder.

22. In the restricted Finder, a user may drag any folder (such as another user's folder) into his or her own folder. If the user does not have access to the dragged folder, the Finder adds an empty folder of the same name to the target folder, but does not copy any files from the dragged folder.

23. In the restricted Finder, RAM disks should not be used.

At Ease and CD-ROM discs

24. At Ease for Workgroups includes a security feature to prevent users from ejecting CD-ROM discs without first entering an administrator password. However, with some CD-ROM drives you can eject a CD-ROM disc manually. At Ease cannot prevent users from ejecting CD-ROM discs in this way.

25. At Ease can display only one CD-ROM panel at a time. If a workstation has a second CD-ROM drive and the user inserts another permitted CD-ROM disc in this

drive, it will not appear until the first CD-ROM has been ejected.

26. At Ease treats CD-ROM drives that are connected to an AppleShare file server as AppleShare volumes, not CD-ROM drives. An administrator cannot use the "CD-ROM Preferences" command on the Maintenance menu to prevent access to these drives.

At Ease and desktop printers

27. To add desktop printers to the Access to Printers list, you should first create the desktop printers in the Finder (not the Panels or restricted Finder environments), then run the At Ease Administration program.

28. Before users log in to a workstation that will be using desktop printers, you should go into the Finder at that workstation and create the desktop printers. Also, make sure that the background printing option is turned ON for StyleWriter and LaserWriter printers. (If it isn't, users may print multiple copies and exceed their page quota, if they have one. The number of pages recorded in the activity log will also be incorrect.) AppleTalk ImageWriters do not print in the background, but if they have been properly set up as desktop printers, At Ease will correctly count the number of copies and enforce any page quotas.

29. If you set a page quota for a workgroup that is using desktop printers, it is best not to allow this workgroup access to the Chooser. (A user could create other desktop printers during a session and bypass the page quota and activity logging.)

Known software conflicts

30. Users may experience problems if an At Ease workstation is running system software version 7.1.2. You should upgrade the system software on At Ease workstations to version 7.5 or later.

31. Current versions of the Speed Copy extension are not compatible with At Ease and should be removed from At Ease workstations.

32. Using the WorldScript Power Adapter extension (version 7.5, 7.5.1, or 7.5.2) on an At Ease Power Macintosh workstation may cause a crash. You can remove the extension or upgrade to system software version 7.5.3 or later.

33. In the restricted Finder environment, the Apple Internet Dialer does not work properly. Use this application from the Panels or Finder environments.

Backing up the At Ease server

34. If you are using Retrospect to back up the At Ease server, you should set the option "Lock out volumes during backup." This will avoid any problems if an At Ease workstation happens to be logged in to the server at the time of the backup. (Other backup programs may have similar options.)

Restoring the At Ease server

35. To ensure that your At Ease server operates correctly after restoring the At Ease server information from a backup copy, refer to the section "Restoring At Ease Information" in Chapter 6, "Administering the At Ease System," and perform these additional steps:

- Open the restored folder At Ease Items WG.
- Open the At Ease Setups folder and drag the Setups.idx file to the Trash. Then close the At Ease Setups folder.
- Open the At Ease Users folder and drag the Users.idx file to the Trash. Then close the At Ease Users folder.

You do not need to restart the computer after restoring the At Ease information.

At Ease and Kid Pix Studio

36. Kid Pix Studio sublaunches several helper applications. To allow Kid Pix Studio to sublaunch these applications successfully, choose Application Preferences from the Maintenance menu of At Ease Administration program and click the Custom button. In the Custom Add screen, add each of the following applications:

Begin_Table

Name	File Creator
KPS 0	Kîd0
KPS 1	Kîd1
KPS 2	Kîd2
KPS 3	Kîd3
KPS 4	Kîd4
KPS 5	Kîd5

End_Table

To type the î character in the file creator names, hold down the Option key while you type the letter i, then release the Option key and immediately type the letter i again.

Miscellaneous points

37. Because At Ease can open up to four files on the server for each workstation that is in the login screen, it is possible that versions of AppleShare earlier than 4.2.1 will not allow as many workstations to connect as specified in the File Server Preferences dialog in the AppleShare Admin program.

38. If there is very little free disk space on the At Ease server, users may experience difficulty logging in.
39. If you delete a user from At Ease, the Internet preferences for this user are not deleted from the At Ease Users folder on the At Ease server. You can delete the preferences manually in the Finder by dragging them to the Trash.
40. At Ease usually identifies applications for a workgroup by file creator ID, not by file name. If two applications on an At Ease workstation have different names but the same file creator ID, the wrong application may be opened. (This might happen, for example, if two separate installer files with different desktop icons are both based on the same installer application.)
41. If a workgroup is required to open and save documents in approved locations and if an AppleShare volume that is not the user document volume is mounted, members of the workgroup will see the volume name dimmed in the Save dialog box. They cannot save to this volume.
42. A user who starts out in the At Ease Panels environment, then switches to the Finder by using the Go to Finder command, may experience problems when opening control panels through the Control Panels submenu in the Apple menu. In most cases, the control panel will appear in front of the At Ease panels, even though the user has switched to the Finder. In certain cases, a message will appear stating that the control panel can't be opened. To avoid these problems, an At Ease user who switches to the Finder by using the Go to Finder command should avoid opening control panels through the Control Panels submenu. Instead, the user should choose Control Panels from the Apple menu and release the mouse button to open the Control Panels window, then double-click the control panel they want to use.
43. The Disk Usage window in the User Disk Space report indicates the total number of bytes in the user's document folder, not the amount of disk space actually used. If you compare this number with the folder size information reported by the Finder (using the Get Info command), you will notice that the Finder number is usually larger.
44. On the Special menu in the Panels environment, an administrator may not see the At Ease Administration program listed even though the program is installed on the startup disk of the workstation. To fix this problem, go into the Finder on the workstation and open the folder that contains the At Ease Administration program. Then go back to the Panels environment.
45. You should not add more than 400 items to a workgroup.

General recommendations for workstations, servers, and networks

=====

46. Extensions provide important enhancements to a workstation's or server's capabilities. Since they require RAM, you should use the Extensions Manager to turn on only those extensions that are really needed, particularly at workstations with less RAM.

47. For maximum server performance, you can put the System Folder on a RAM disk. (The RAM disk feature is available on newer Macintosh models.)

48. Apple workgroup servers provide built-in hard disks that are 20-30 percent faster than desktop Macintoshes. Faster hard disk access can significantly improve overall server performance.

49. Use the Network Performance command in Apple Network Assistant to check periodically on network performance and to troubleshoot network problems.

AppleVision Software Fix ReadMe (6/96)

Revised: 6/14/96
Security: Everyone

AppleVision Software Fix ReadMe (6/96)

=====

Article Created: 14 June 1996

TOPIC -----

This article is the AppleVision Software Fix for System 7.5 Update 2.0 Read Me File.

DISCUSSION -----

This document contains important information for AppleVision customers.

Who needs to install the AppleVision Software Fix?

If you have an AppleVision Display and you have problems after installing the System 7.5 Update 2.0, you should install the AppleVision Software Fix. This software fixes such problems as:

- When you press the buttons on the front of the display, you see a message that says "No AppleVision Display is connected."
- You have a Power Macintosh 7200 and can't find the Monitors & Sound control panel in the Control Panels folder.
- The Monitors & Sound control panel does not have Geometry, Color, and Monitor Sound buttons. (Note: The Monitor Sound button appears only if you have an AV monitor.)
- You can't change the resolution of the AppleVision Display or you can't open the AppleVision Setup control panel.
- Macintosh Guide does not contain information on the AppleVision Software or Display.

How to install the AppleVision Software Fix

After you install System 7.5 Update 2.0 and AppleVision Software 1.0.x, you can install the AppleVision Software Fix. Follow these steps:

- 1) If you don't already have an AppleVision Software Fix floppy disk, then copy the AppleVision Software Fix online disk image to a floppy disk.

- 2) Insert the floppy disk in your computer and double-click the Installer icon.

What is installed?

On a 68040 or non-PCI Power Macintosh computer, the installer adds the following files to the System Folder:

- (1) Display Enabler version 2.0.2 is added to the Extensions folder.
- (2) AppleVision Guide Additions version 1.1 is added to the Extensions folder.

On a PCI-based Power Macintosh computer, the installer adds the following files to the System Folder:

- (1) Monitors & Sound version 1.1 is added to the Control Panels folder.
- (2) SystemAV version 1.1 is added to the Extensions folder.
- (3) AppleVision version 1.0.4 is added to the Extensions folder.
- (4) Monitors & Sound Guide Additions version 1.0 is added to the Extensions folder.
- (5) AV Monitors Guide Additions version 1.0 is added to the Extensions folder.
- (6) SimpleSound version 1.0 is added to the Apple Menu Items folder.

If you have a 68040 or non-PCI Power Macintosh

When you installed System 7.5 Update 2.0, if you used the Custom Install option to put the Monitors & Sound control panel on a 68040 or non-PCI Power Macintosh, the AppleVision software will not work. To use the AppleVision Software, follow these steps:

- 1) Remove the Monitors & Sound control panel from the Control Panels folder.
- 2) Remove AppleVision extension from the Extensions folder.
- 3) Restart the computer.
- 4) Install AppleVision Software version 1.0.x.
- 5) Install the AppleVision Software Fix.

AppleShare 4.2 to 4.2.1 Updater Read Me (6/96)

Revised: 6/14/96
Security: Everyone

AppleShare 4.2 to 4.2.1 Updater Read Me (6/96)

Article Created: 14 Jun 1996

TOPIC -----

This article is the AppleShare 4.2 to 4.2.1 Updater Read Me file.

DISCUSSION -----

Apple recommends that all customers using AppleShare 4.2 or AppleShare 4.2 v1.0.2 upgrade to AppleShare 4.2.1, which supersedes the previous releases.

There are two ways for customers to do this. First, they can call (800) 293-6617 ext 759 and order an upgrade kit for the cost of shipping and handling (\$6.95).

The other method of upgrading is to use the AppleShare 4.2->4.2.1 Updater.

NOTE:

The AppleShare 4.2 to 4.2.1 Updater will not modify AppleShare 4.2 v1.0.2. Those customers will need to use their original AppleShare 4.2 CD-ROM to drag the old version of the File Server Extension to the extensions folder. An alternative to the drag install is to run the AppleShare installer again and replace the AppleShare 4.2 v1.0.2 application with the older AppleShare 4.2 when prompted.

Installation Instructions

On a system with AppleShare 4.2 already installed, complete the following steps to upgrade to AppleShare 4.2.1.

- 1) Double Click on the patching application
- 2) Click on the patch button.
- 3) Four components will be patched. You will be prompted to locate each of the following in your system folder.
 - AppleShare File Server

- FileServer Extension
- AppleShare Admin
- AppleShare Admin Guide

4) After patching all four components a message will be displayed that the patch was successfully applied.

5) Restart your server.

6) Launch AppleShare 4.2.1.

Power Macintosh 5400/120: Need to Install Revision 2? (7/96)

Revised: 7/13/96
Security: Everyone

Power Macintosh 5400/120: Need to Install Revision 2? (7/96)

Article Created: 14 June 1996
Article Reviewed/Updated: 13 July 1996

TOPIC -----

I have seen the list of computers that should have System 7.5.3 Revision 2 installed on them. However, I have a Power Macintosh 5400/120 computer, which I thought had Revision 2 pre-installed on it, but this computer is not among those listed. Do I need Revision 2 on this computer? If so, why is it not listed with the others?

DISCUSSION -----

The Power Macintosh 5400/120 requires System 7.5.3 Revision 2. However, Revision 2 is already pre-installed on the hard drive and included in the system software installer on the CD-ROM disc. Since Revision 2 is already installed, you do not need to re-install it using the updater installer. The list of computers that should have Revision 2 installed includes only those computers that need to be updated. It does not include computers that ship with Revision 2 already installed.

Macintosh: Sound Terminology Definitions (6/96)

Revised: 6/14/96
Security: Everyone

Macintosh: Sound Terminology Definitions (6/96)

=====

Article Created: 14 June 1996

TOPIC -----

The Power Macintosh 8500 technical specifications refers to "A-weighted" in the audio section. What is this?

DISCUSSION -----

The first tentative standard for sound level meters (Z24.3) was published by the American Standards Association and the Acoustical Society of America in 1936. Two frequency curves "A" and "B" were modelled on the ear's response to low and high levels of sound respectively. The two curves became a standard or "weighted" measurement.

Apple uses an "A-weighted" curve at low frequencies to mark the decibels at which noise begins to be apparent to the human ear. The level just under the point at which noise is detected would contain "no audible discrete tones."

Sound in and sound out can also be measured by its quality - in bits and sample rates. Sound is captured using a sample rate - or the number of times the computer listens in a given period to the audio source. Higher numbers (44.1 kHz) denote an increased number of times the computer is capturing information. After the sound is captured, it is stored in memory measured in bits. With more room to store subtle nuances, 16 bit audio is more realistic than 8 bit audio.

Older Macintosh computers used mic-level to capture audio which was not pre-amplified. Pre-amplified audio is more sensitive and is necessary for speech recognition or nuances that occur at low levels. The differences between mic-level and line-level audio can be measured in the amount of decibels per one milliwatt (dBm) where mic-level is between -60dBm to -20dBm and nominal line-level is +4dBm.

Finally, captured audio can become distorted if amplified beyond a certain point. The point at which sound begins to exhibit noise which did not exist in the original source is measured as Total Harmonic Distortion. The result is the

loudest decibel reading measured without any audible discrete tones (tones audible to the human ear).

More information on audio terminology can be found at the Acoustical Society of America homepage, <http://asa.aip.org>

PowerTalk 1.1.6: ftp Text Document (6/96)

Revised: 6/15/96
Security: Everyone

PowerTalk 1.1.6: ftp Text Document (6/96)

Article Created: 15 Jun 1996

TOPIC -----

This article is the text document with PowerTalk 1.1.6 at Apple Computer's ftp software update sites.

DISCUSSION -----

Name: PowerTalk
Version: 1.1.6
Released: December 5, 1995
Description: The posting of this software is intended for customers who upgraded their PowerBook 500 series computers to PowerPC. For more information, please see the PowerTalk Guide included with this software.

This software consists of two self-extracting archives of Disk Copy 1440K disk images. To use, download, double-click the downloaded file (this decompresses it), and use Disk Copy to create the disks.

Disk Copy can be found in the Utilities folder posted here.

PowerTalk 1.1.6 consists of 2 disks:

Name as Posted	Actual Disk Name
PT 1.1.6-1of2.sea	Install.sea

PowerTalk 1.2.3: ftp Text Document (6/96)

Revised: 6/15/96
Security: Everyone

PowerTalk 1.2.3: ftp Text Document (6/96)

Article Created: 15 Jun 1996

TOPIC -----

This article is the text document with PowerTalk 1.2.3 at Apple Computer's ftp software update sites.

DISCUSSION -----

Name: PowerTalk
Version: 1.2.3
Released: March 18, 1996
Description: This version of PowerTalk is included on the System 7.5 Update 2.0 CD. It is recommended for customers who are using PowerTalk and System 7.5 Update 2.0.

This software consists of two self-extracting archives of Disk Copy 1440K disk images. To use, download, double-click the downloaded file (this decompresses it), and use Disk Copy to create the disks.

Disk Copy can be found in the Utilities folder posted here.

PowerTalk 1.2.3 consists of 2 disks:

Name as Posted	Actual Disk Name
PT 1.2.3-Disk1of2.sea	Install
PT 1.2.3-Disk2of2.sea	PowerTalk

PowerTalk 1.2.3 includes the following enhancements:

- PowerTalk Catalogs Extension version 1.1.1 no longer displays an out-of-memory error when you open a catalog.
- PowerTalk AppleMail version 1.1.2 works better on systems with many fonts installed and defaults to "sender only" for mail replies.

- PowerTalk DigiSign Utility version 1.1.1 improves printing on HP DeskWriter C and 550-style printers.
- Direct Dialup version 1.1.1 works better when dialing using a long string and won't time out while sending a large letter or a letter with a large enclosure.
- Fixes a potential crash problem that occurs if both PowerTalk and At Ease are installed. While PowerTalk and At Ease no longer crash when used together, accessing all of Power Talk's functionality requires the Finder (open the Special menu in At Ease and choose Go To Finder).

LaserWriter 8 version 8.3.4 Read Me (6/96)

Revised: 6/18/96
Security: Everyone

LaserWriter 8 version 8.3.4 Read Me (6/96)

=====

Article Created: 17 June 1996

TOPIC -----

This is the ReadMe file from LaserWriter 8.3.4.

DISCUSSION -----

What is the LaserWriter 8 version 8.3.4?

PowerPC-based computers may have difficulty printing to some third party network printers or print spoolers in certain network configurations. When printing to one of these devices, your computer may freeze or never complete printing, and you may need to restart your computer or cancel the printing job. LaserWriter 8 version 8.3.4 fixes this problem. Note: If you have already installed LaserWriter 8 version 8.4 you do not need version 8.3.4.

In addition to installing LaserWriter 8 version 8.3.4, you should make sure that your computer's system software is version 7.5.3 or later. For information on obtaining system software version 7.5.3, refer to Apple Computer's America Online or Internet sites, or see the custom support information that came with your computer to call Apple directly.

To install this LaserWriter version 8.3.4 follow these steps:

1. Locate the System Folder on the computer's hard disk. Don't open the System Folder.
2. Drag the file named "LaserWriter 8" to the System Folder.
3. A message appears asking if you want the LaserWriter 8 extension to be put into the Extensions folder. Click OK. If a second message appears stating that LaserWriter 8 already exists and asks you if you would like to replace it, click OK.
4. Open the Special menu and choose Restart.

IMPORTANT

If the second message does not appear, then you do not currently have LaserWriter 8 and the associated files installed. Do the following:

1. Refer to the printed manual that came with your computer, and follow the instructions for doing a custom installation.
2. In the Custom Install dialog box you'll see a list of items that can be installed. Click the arrow to the left of the "Printing" check box to reveal the list of printers.
3. Click to put an X in the "LaserWriter 8" checkbox.
4. Click Install. If a message appears stating that you have a newer version already installed, click Newer.
5. Quit the Installer. Open the Special menu and choose Restart.
6. Install LaserWriter 8 version 8.3.4.

AppleCD 600e: Installing Software from Floppy Disk (6/96)

Revised: 6/25/96
Security: Everyone

AppleCD 600e: Installing Software from Floppy Disk (6/96)

=====

Article Created: 25 June 1996

TOPIC -----

This article describes how to install the AppleCD 600e software on Macintosh computers, which did not previously have the CD-ROM software installed on them. Without the CD-ROM software installed, your Macintosh will not recognize the Startup CD disc.

DISCUSSION -----

Many of the newer Macintosh computers have built-in support for CD-ROM drives. These Macintosh computers have the basic CD-ROM drivers in ROM. If your computer does not have the CD-ROM drivers in ROM, you will not be able to startup your Macintosh computer with the Startup CD included with the AppleCD 600e CD-ROM drive. In order to get the CD-ROM drivers installed, you must copy the Apple CD-ROM extension to a floppy disk. You will have to use a Macintosh computer with a CD-ROM drive to copy the Apple CD-ROM extension from the CD-ROM included with the AppleCD 600e drive.

Copying Minimum CD-ROM Files
=====

Step 1

Open the CD-ROM Software folder on the CD-ROM Setup disk.

Step 2

Drag the Apple CD-ROM file to a floppy disk.

Step 3

Choose Restart from the Special menu.

Let your Macintosh start up from the normal startup drive.

Step 4

Insert the floppy disk with the Apple CD-ROM file on it into your Macintosh computer.

Step 5

Drag the Apple CD-ROM file onto the closed System Folder on the hard drive.

A dialog appears explaining that extensions need to be stored in the Extensions folder.

Step 6

Click OK

This places the Apple CD-ROM file in the Extensions folder.

Step 7

Choose Restart from the Special menu.

Allow the Macintosh to start up from the hard disk.

Step 8

Insert the CD-ROM Setup CD in the CD-ROM drive.

The CD-ROM disc will appear on your desktop.

Step 9

Double-click Installer on the CD-ROM Setup volume to finish installing all files from the CD-ROM Setup volume.

When the Installer is done, an Installation Complete dialog with a Restart button appears.

Step 10

Click Restart.

After restarting, your Macintosh is able to use the AppleCD 600e drive.

Portable StyleWriter: Out of Paper Error (6/96)

Revised: 6/18/96
Security: Everyone

Portable StyleWriter: Out of Paper Error (6/96)

=====

Article Created: 17 June 1996

TOPIC -----

I have a Portable StyleWriter and when I choose Print, a dialogue box appears telling me that the printer is out of paper, but the printer has paper loaded. What am I doing wrong?

DISCUSSION -----

In the Print dialogue box there is an option for Feed: Automatic or Manual. If Manual is selected, the printer will prompt you to insert a sheet of paper. If Automatic is selected, you will not see this dialogue box.

MessagePad System Update 2.0 (526060)US ReadMe (6/96)

Revised: 6/17/96
Security: Everyone

MessagePad System Update 2.0 (526060)US ReadMe (6/96)

=====

Article Created: 17 June 1996

TOPIC -----

This article is the MessagePad System Update 2.0 (526060)US Read Me file.

DISCUSSION -----

This document describes the product enhancements included in MessagePad 130 System Update 2.0 (526060)US.

System Update 2.0 (526060)US is for Apple MessagePad 130 customers in the United States. This version will install over the following system software versions for MessagePad 130:

- version 2.0 (525314)

If this system update is already installed on your MessagePad, you will not damage your MessagePad by reinstalling the update. Also, you will not damage an original MessagePad, MessagePad 100, MessagePad 110, MessagePad 120 or other Newton PDA if you attempt to install this system update by mistake.

Before you install any system update, you should backup your MessagePad 130 with the Newton Backup Utility or to a storage card (PCMCIA card).

This is the base system update that ships on the MessagePad 130 with Newton 2.0 in the United States. It is being provided in the event you accidentally erase it from your MessagePad.

Changes in System Update 2.0 (526060):

- Old ToDo's can now be deleted from the Dates overview.
- Pending alarms no longer trigger immediately after setting the clock to the day of the alarm.
- The StyleWriter 1500 and 2500 have been added to the printer list.
- Deleting found ToDo's from the find overview no longer causes a -48809

error.

- A clipping/scaling problem with large pictures was corrected.
- Class 2 Faxing now works as expected.
- The "=95 MessagePad" string has been removed from the reset and sleep screens.
- The back light can now be turned on at the same time the unit is turned on instead of requiring a separate toggle of the power switch.
- Tapping stop during reception of a System Update works correctly.

Color OneScanner 600/27: Scanning 35mm Slides (6/96)

Revised: 6/18/96
Security: Everyone

Color OneScanner 600/27: Scanning 35mm Slides (6/96)

=====

Article Created: 17 June 1996

TOPIC -----

Is it possible to scan 35mm slides or negatives on the Apple Color OneScanner 600/27?

DISCUSSION -----

Flatbed scanners which allow you to scan in negative or positive film require a transparency adapter. The Color OneScanner 600/27 does not have a transparency adapter, and was not designed to support scanning of any type of film.

Apple Network Administrator Toolkit Specifications (7/96)

Revised: 7/15/96
Security: Everyone

Apple Network Administrator Toolkit Specifications (7/96)

Article Created: 17 June 1996
Article Reviewed/Updated: 11 July 1996

TOPIC -----

The following article contains a list of technical specifications and service and support information for the Apple Network Administrator Toolkit.

DISCUSSION -----

Technical Specifications
=====

At Ease for Workgroups 4.0

- Access controls for:
 - Applications
 - Documents
 - Apple Menu items
 - User's local hard disk
 - Servers
 - CD-ROM discs
 - Floppy disks
 - Printers
- User types:
 - Administrator (full privileges)
 - Teacher (full or limited privileges, as designated by the administrator)
 - Student (limited privileges)
- Up to 200 different setups, each of which can include any combination of students, teachers, and administrators
- Choice of interface (At Ease, restricted Finder, or full Finder) for each setup
- Centralized server-based file storage
- Configurable disk-space quotas for user documents
- Printer quotas

- Shared folders (including drop boxes for student assignments and teacher handouts)
- Interface assigned to a user name, so each user always gets the same interface no matter where he or she logs in
- Save options (as access privileges allow):
 - To the local hard disk
 - To a designated server
 - To removable-media devices (floppy disks, Zip disks, Syquest drives)
- Security options
 - Disable log in after a certain number of password attempts
 - Prevent users from changing their passwords
 - Prevent users from setting their passwords to null
 - Allow users to log in by selecting their user names from a displayed list, or require them to type in their user names
- Optional "Speak Buttons" command for beginning readers who may have trouble reading At Ease button names

Apple Network Assistant

=====

(Unless otherwise noted, all listed features can be performed on multiple systems at once.)

- Determine hardware and software configurations (including version numbers)
- Check for outdated, missing, or extraneous software (applications and system extensions)
- Copy files or folders
 - Applications, system files, and documents can automatically be put in the proper folders on the destination system(s), based on their location on the originating system
 - A special broadcast protocol can copy files to multiple networked Macintosh systems in the same time it takes to copy them to a single system
- Restore a system configuration by mirroring the administrator's hard disk
- Delete files and folders
- Modify systems settings (such as sound volume or printer selection)
- Restart or shut down
- Broadcast audio messages to selected users or hold a two-way conversation with one user
- Work with users by viewing and controlling their screens
- Share an administrator's or user's screen with others in the lab
- Launch or quit applications on client systems
- Lock computer screens

Apple User and Group Manager

=====

- Find available network services
 - AppleShare servers

- At Ease for Workgroups servers
- First Class servers
- Create, delete, and modify user accounts and groups
- Copy user and group data between servers (such as between AppleShare servers, or from an AppleShare server to a First Class server)
- Consolidate user lists from multiple servers
- Import user lists from databases, text documents, and so on
- Export user lists to text files

System requirements

=====

Administration system

- Apple Macintosh, PowerBook, Power Macintosh, or other Mac OS-based computer (except Mac Plus)
- 8MB of RAM
- Mac OS software version 7.1 or later
- AppleShare Client software (included with Mac OS)
- Display with at least 640- by 480-pixel resolution
- CD-ROM drive (on administration system or server)
- AppleTalk network connection (Ethernet is recommended, and required for screen-sharing functions)

Client systems

- Apple Macintosh, PowerBook, Power Macintosh, or other Mac OS-based computer (except Mac Plus)
- 4MB of RAM
- Mac OS software version 7.1 or later
- AppleShare Client software (included with Mac OS) At Ease for Workgroups 4.0 server system
- AppleShare 3.0 or later software (AppleShare 4.0 or later recommended)
- AppleTalk network connection (Ethernet recommended)

Ordering Information

=====

Apple Network Administrator Toolkit

Retail Order No. 435010U

Education Order No. 435036U

- At Ease for Workgroups 4.0 software
- Apple Network Assistant software
- Apple User and Group Manager software
- User manual

For up to 10 Macintosh systems

Apple Network Administrator Toolkit Description (7/96)

=====

Article Created: 17 June 1996
Article Reviewed/Updated: 11 July 1996

TOPIC -----

This article contains a description of the Apple Network Administrator Toolkit.

DISCUSSION -----

Overview
=====

Finally there is a powerful yet easy-to-use management software for networked Macintosh systems. The Apple Network Administrator Toolkit has the applications you need to control and manage all the systems on your network from a single point.

Whether you are an educator, a computer lab director, or the administrator of a business network, the Apple Network Administrator Toolkit will help you stay productive and keep your networked systems running securely and efficiently. It will make your job easier from the moment you start using its comprehensive suite of tools.

Flexible access and management

Protect applications, documents, CDs, and system settings on all your Macintosh computers with the latest version of Apple's popular security and access management tool, At Ease for Workgroups 4.0. You can create different At Ease configurations for classes or individuals, and assign privileges for each setup -- all from a central location. You also have a choice of interfaces for each workgroup: the simplified At Ease interface, a secure version of the traditional Macintosh desktop, or the standard Finder. Simply assign the working environment most appropriate for each user or group.

Network wide management

..TIL20053-Apple_Network_Administrator_Toolkit_Description_7-96.pdf

With Apple Network Assistant software, you can manage a group of networked Macintosh computers from a central location. Ensure that everyone is using the right version of each application. Check the version numbers on each networked computer, then quickly create a list of machines to be updated -- a simple mouse click, and Apple Network Assistant will simultaneously update each machine.

You can also restart or shut down multiple systems with a single click, quickly and easily restore a computer's hard disk to a known configuration, and delete unnecessary files from multiple systems in one simple step.

The special screen-sharing function of Apple Network Assistant allows you to give personal assistance across a network of computers. Let users view your Macintosh screen while you perform a task, or share someone else's screen with everyone. View multiple users' screens at once, or get a closer look at each screen one by one. Even take control of a user's system to demonstrate an action.

User and group management

Tired of having to type in long lists of names and passwords for each network resource? Apple User and Group Manager software saves you time and effort by letting you consolidate user lists from multiple sources. Add users quickly by copying part or all of a list from one server to another, or by importing student or employee lists. Create users and groups, and change passwords. The Manager supports AppleShare 3.0, First Class 2.5, and At Ease for Workgroups 4.0 servers.

The Apple Network Administrator Toolkit: Powerful tools for network management.

Features

=====

Flexible access and management

- Assign different interfaces for novice and advanced Macintosh users
- Define application and document access privileges for each user or group
- Control access to selected applications, files, CD-ROMs, servers, printers, and other resources
- Set the maximum number of pages each user can print

Network wide management

- Manage all your networked Macintosh systems from a single location
- Check software versions, file modification dates, disk space, amount of RAM, and other system attributes
- Restore a system's hard disk to a previous configuration
- Help users with computer tasks by sharing your Macintosh screen or by viewing or controlling theirs

User and group management

- Consolidate user lists from multiple sources
- Drag and drop user and group data from one service to another
- Create user lists from existing school registers or employee databases

Power Macintosh 5260/100 & 5400/120: Using System 7.5.1 (7/96)

Revised: 7/13/96
Security: Everyone

Power Macintosh 5260/100 & 5400/120: Using System 7.5.1 (7/96)

=====

Article Created: 17 June 1996
Article Reviewed/Updated: 13 July 1996

TOPIC -----

This article contains questions about using System 7.5.1 on Power Macintosh 5260/100 and Power Macintosh 5400/120 computers.

DISCUSSION -----

1) Question: Was System 7.5.1 tested on the Power Macintosh 5260/100?

Answer: During the development cycle of the Power Macintosh 5260/100, System 7.5 Update 2.0 had just been completed. Because of this, both System 7.5.1 and 7.5.3 were fully tested on the Power Macintosh 5260/100.

2) Question: Will System 7.5.1 work on the Power Macintosh 5260/100?

Answer: Yes, you can install System 7.5.1 from the Power Macintosh 5260/100 system software CD without installing System 7.5 Update 2.0. However, with the many fixes and improvements included with System 7.5.3, Apple recommends that you use System 7.5.3.

3) Question: Was System 7.5.1 tested on the Power Macintosh 5400/120?

Answer: No, the Power Macintosh 5400/120 requires System 7.5.3, Revision 2. Because of this requirement, System 7.5.1 was not tested on this computer.

4) Does System 7.5.1 work on the Power Macintosh 5400/120?

Answer: No, the Power Macintosh 5400/120 requires System 7.5.3, Revision 2 and cannot be downgraded to System 7.5.1.

Color StyleWriter 2400: Color Printing in Landscape Mode (6/96)

Revised: 6/24/96
Security: Everyone

Color StyleWriter 2400: Color Printing in Landscape Mode (6/96)

=====

Article Created: 24 June 1996

TOPIC -----

I have a Color StyleWriter 2400 and I cannot print color documents in Landscape Mode. Black and white and grayscale documents print properly in Landscape, but when I print in color, the computer locks up after printing approximately 8% of the job. I am using the latest version of the Color StyleWriter 2400 driver (version 2.1.2). What am I doing wrong?

DISCUSSION -----

The Color StyleWriter 2400 driver will not print color in Landscape Mode if virtual memory is active. In order to print color documents in Landscape, you can turn off virtual memory, use the Quickdraw GX version of the driver, or use the new Color StyleWriter 2500 driver.

Printer Share: Prints when Server is Asleep (6/96)

Revised: 6/20/96
Security: Everyone

Printer Share: Prints when Server is Asleep (6/96)

=====

Article Created: 19 June 1996

TOPIC -----

If an Apple serial or SCSI printer (such as the Personal LaserWriter SC or the StyleWriter series) is being shared with Printer Share from a Macintosh that is in Energy Saver "Sleep" mode, will the printer still print a job sent from another Macintosh computer on the network?

DISCUSSION -----

Yes. Although the monitor remains dark on the Macintosh that is sharing the printer, the processor and hard drive become active and the job prints properly.

AppleShare Custom Settings ReadMe (6/96)

Revised: 6/20/96
Security: Everyone

AppleShare Custom Settings ReadMe (6/96)

=====

Article Created: 20 June 1996

TOPIC -----

The following article is the Read Me document for the AppleShare Custom Settings (ASCS) application.

DISCUSSION -----

Important Information about AppleShare Custom Settings

There are two reasons that an administrator might choose to use the AppleShare Custom Settings (ASCS) application to configure their AppleShare server.

- To enable large volume support on servers with volumes between 2 and 4 gigabytes.
- To increase the number of open files the server will support for remote clients.

The vast majority of AppleShare sites will not require either of these options. The AppleShare Custom Settings application can only be run on systems with AppleShare 4.2.1 or later.

Large Volume Support

When a client mounts a server volume, AppleShare returns the disk information for the volume mounted. Support for large volumes that are greater than 2 gigabytes was added with System 7.5. Versions of the Finder prior to 7.5 are not able to function correctly with volumes that are larger than 2 gigabytes.

Since AppleShare can't determine the version of system software a client is using, it ensures that the disk information is 'clipped' to 2 gigabytes for backward compatibility. In this case, clients generally function as you would expect with a significant caveat. While the user is able to copy data to or from such a volume, the disk information displayed in the Finder is not accurate. Only the 'in disk' or the 'available' will be accurate. The other value will be

inaccurate.

For administrators who understand the backward compatibility issues, the AppleShare Custom Settings makes it possible to configure AppleShare 4.2.1 or later server to return accurate disk information for volumes up to 4 gigabytes in size.

WARNING: If a client running system software prior to System 7.5 mounts an AppleShare server with the large volume support enabled and the volume is larger than 2 gigabytes, the Mac may crash and data loss can occur. Apple will only support this option with clients and servers that are using System 7.5 or later.

Maximum Number of Open Files

The Mac O/S allows a maximum of 346 open files at any one time. This number includes files opened by the system on the user's behalf. Also, a file with both the data and resource forks open, count as two files. For multi-user database applications using AppleShare this limitation can significantly reduce the number of users that can be supported at any one time.

However, often these applications are opening the same file(s) over and over in read only mode. For example, each user that signs in might open the user-id file. A feature introduced with AppleShare 4.2 was the ability to track and count these read only requests and, while the 346 unique file limit remained, it allowed many more users to access the database.

Most servers will not run into the default limit of 3,000 open files. However, for those that do, the administrator can now increase the maximum number of concurrent open files to 6,000 using the AppleShare Custom Settings application.

Macintosh 5xxx/6xxx Tester: Logic Board & Cache Messages (7/96)

Revised: 7/13/96
Security: Everyone

Macintosh 5xxx/6xxx Tester: Logic Board & Cache Messages (7/96)

Article Created: 18 June 1996
Article Reviewed/Updated: 13 July 1996

TOPIC -----

I am using the 5xxx/6xxx Tester 1.0 to see if my computer qualifies for the Repair Extension Program for Power Macintosh and Performa 5200, 5300, 6200, and 6300 computers*. I need to know if this program will report both the logic board and the cache DIMM issues if my computer has them both?

DISCUSSION -----

The 5xxx-6xxx Tester 1.0 first checks for the logic board issue, and then it checks for the cache DIMM issue. A dialog is presented for the first issue found. So, it is possible that your computer could be experiencing both the logic board and the cache issue, but the Tester application only reports the logic board issue. However, when the logic board is repaired, it is replaced with one that has the correct cache DIMM. Thus, if your computer is experiencing both issues, they will both be corrected in the Repair Extension Program even though the Tester reports only the logic board issue.

Note that if your computer is only experiencing the cache DIMM issue, the 5xxx/6xxx Tester will display the appropriate message.

*Note:

The models included in this program are Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300. (The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.)

Installing System 7.5, Version 7.5.3 Read Me (6/96)

Revised: 6/28/96
Security: Everyone

Installing System 7.5, Version 7.5.3 Read Me (6/96)

Article Created: 19 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the Installing System Software, Macintosh System 7.5, Version 7.5.3 ReadMe file.

DISCUSSION -----

What is Macintosh System 7.5, Version 7.5.3?

System 7.5, Version 7.5.3 consists of four major components:

- software to upgrade your computer to System 7.5
- QuickDraw GX for more powerful printing, typography, and color publishing capabilities
- PowerTalk electronic mail and collaboration software
- OpenDoc software which supports a new type of software called a "part." Many parts will be available from third-party software manufacturers who support OpenDoc technology.

Before you install

Read the following tips before you install system software version 7.5.3:

- Installing on a PowerBook

You cannot install this software on a PowerBook using SCSI disk mode. To correctly install on a PowerBook, install from the floppy disks or the CD. (SCSI disk mode is when you connect your PowerBook with a SCSI Disk Adapter cable to another computer and use the PowerBook as an external hard disk.)

- Installing printer software

When you use the Easy Install option to install this software, it updates the

existing software on your hard disk. If you want additional software (such as a specific printer driver) that was not already on your computer but is included with this upgrade kit, use the Custom Install option.

- Minimum RAM disk requirements for a RAM disk

The new minimum RAM disk size is 416K. If a smaller RAM disk exists during the installation of this software, it will be turned off and its contents lost when the computer is restarted. Therefore, before installing this software on a computer with a RAM disk smaller than 416K, move all the contents of the RAM disk to another disk.

- Default Control Panel Settings

This software resets all settings in the Apple Menu Options and Views control panels to their default values. If you have made changes to either or these control panels, you will need to set them again after installing this software. If you have set Apple Menu Options to track more than ten items in any category, you may want to move some of those items out of their folders before you install the software, which deletes all but the ten most recent items in each category.

- Using the CD-ROM

To eject the CD-ROM, drag its icon to the trash. The CD should eject automatically from the CD-ROM drive when you restart your computer. If this does not happen, turn off the computer and manually eject the CD.

- Virtual Memory

If you have a PCI-based Macintosh and choose the Clean Install option, virtual memory will be turned on after you install System 7.5, Version 7.5.3.

With any Macintosh model, if you choose the Clean install option to install a Universal System for any Macintosh, virtual memory will be turned on after you install System 7.5, Version 7.5.3.

To turn virtual memory off, open the Memory control panel and click the "Off" radio button.

- Installing on a Macintosh Plus

To install System 7.5, Version 7.5.3 on a Macintosh Plus, you will need a CD-ROM drive, the CD version of System 7.5.3, and System 7.0 on 800K floppy disks.

- 1) Install System 7.0.

System 7.0 on 800K floppy disk images are available on the Internet from:
ftp://ftp.info.apple.com/Apple.Support.Area/Apple.Software.Updates/US/Macintosh/System/System_7.0

- 2) Restart your computer.

- 3) Insert the System 7.5 Version 7.5.3 CD.

Continue with steps 3-8, under "Step 3: Install System 7.5" below.

Installing System 7.5

=====

You can install System 7.5 from floppy disks or a CD-ROM disc (depending on what came in your package). Install System 7.5 before you install PowerTalk, QuickDraw GX, OpenDoc, or any other software that requires System 7.5.

Use the following guidelines to help ensure a successful installation:

- Turn off disk security, virus protection, or screen saver programs before beginning.
- If you are having problems during an installation, try quitting the Installer and restarting your computer with extensions off. If you are already using System 7.5, open the Extensions Manager control panel and choose "System 7.5.x" in the Sets pop-up menu. If you are using an earlier version of system software, hold down the Shift key while you restart.
- To ensure a smooth upgrade to system software version 7.5.3, check with the manufacturers of any third-party software you use to make sure it is compatible with version 7.5.3. Also see Appendix A ("Testing for Compatibility") in the manual that came with your upgrade kit for more information on software compatibility.
- If you are installing on a PowerBook, make sure your PowerBook is plugged in and set not to go to sleep. For instructions, see the manual that came with your computer.
- If At Ease software is installed on your computer, you must turn it off before you install this software. For instructions, see the manual that came with At Ease.
- If you are installing from installation disks you made from the disk images that come on the CD, make sure the Disk Tools disk and the installation disks are all locked before you use them. To lock a floppy disk, slide the plastic tab in the upper-left corner down.

Step 1: Check your hard disk

- 1) Shut down your computer.
- 2) Insert the Disk Tools disk for your model of computer into the floppy disk drive.

IMPORTANT: The following Disk Tools disks come with your upgrade kit:

- Disk Tools 1: for 68K computers with SCSI hard disks
- Disk Tools 2: for all PowerPC computers and all 68K computers that have an IDE hard disk, which include the Macintosh LC 580, LC 630, LC 630 DOS, Quadra 630 series computers, Performa 580 series computers, Performa 630 series computers, PowerBook 150, and PowerBook 190 series computers. Also, if you have a 68K computer and have installed a PowerPC Upgrade Card, you should use the Disk Tools 2 disk.

- 3) Turn on your computer. The Disk Tools icon appears on your screen. If you see an error message on the screen telling you the wrong Disk Tools disk was inserted, look for the other Disk Tools disk in your kit and insert it.
- 4) Double-click the Disk First Aid icon and follow the instructions on the screen. Disk First Aid checks your hard disk for problems. If you have a problem using Disk First Aid, see the Troubleshooting chapter in the manual that came with your upgrade kit.
- 5) When you are finished, choose Quit from the File menu.

Step 2: Update the driver

Important If you have a PowerBook 150 series computer, you can skip this step.

IMPORTANT: If you have a Power Macintosh 5200 series computers with 800 Megabyte hard disk, you should use the version of the Drive Setup software that came with your computer rather than the version included in this upgrade kit.

- From the Disk Tools 1 disk

If you are using the Disk Tools 1 disk, follow these steps:

- 1) Double-click the Apple HD SC Setup icon.
- 2) Click Drive until the disk you want to update appears.
- 3) Click Update and follow the instructions on the screen.
- 4) Turn off your computer.

- From the Disk Tools 2 disk

If you are using the Disk Tools 2 disk, follow these steps:

- 1) Double-click the Drive Setup icon to open it.
- 2) In the list of drives, click the disk you want to update.
- 3) Pull down the Functions menu and choose Update Driver.
- 4) When a message tells you that the update is complete, choose Quit from the File menu.
- 5) Turn off your computer.

Step 3: Install System 7.5

- From floppy disks

- 1) Insert the Install Disk 1 disk into a floppy disk drive.
- 2) Turn on your computer.
- 3) Open the Installer by double-clicking its icon.
All system software files are compressed. The Installer program will expand them during installation. Do not drag them to your hard disk.
- 4) When you see the Installer's welcome screen, click Continue. The Easy Install dialog box appears.

- 5) Make sure that the destination disk indicated on the screen is the one on which you want to install system software. If the wrong disk name appears, click the Switch Disk button until the correct disk name appears.
 - 6) Click Install. The Installer updates the software in the System Folder on your hard disk.
 - 7) Follow the instructions on the screen. On-screen messages tell you if you need to insert other disks. It takes at least 20 minutes to complete the installation using floppy disks. (It takes 10-20 minutes using the CD-ROM disc.) Installation times vary depending on your computer model.
 - 8) When the installation is complete, restart your computer. If for some reason the installation was not successful, try the installation again.
- From the CD-ROM disc

If you are using an Apple CD-ROM drive, you should first start up your computer from the CD, then install the software. Follow these steps:

- 1) Insert the CD-ROM disc in the CD-ROM drive.

If you are using an external CD-ROM drive: Turn on the CD-ROM drive and insert the CD before starting your computer.

If you are using an internal CD-ROM drive that uses a caddy: Insert the CD before starting your computer.

If you are using an internal CD-ROM drive that does not require a caddy: Turn on the computer, insert the CD, and then turn off your computer.

- 2) Turn on your computer.

If you are using an Apple CD-ROM drive, hold down the C key on your keyboard until you see the Welcome to Macintosh message.

NOTE: This startup procedure will not work on all computers and CD-ROM drives. See the SimpleText documents in the Before You Install folder for late-breaking information.

- 3) Open the Install System Software folder on the CD.
- 4) Follow steps 3-8 in the previous section, "From Floppy Disks."

52xx/62xx Diagnostic Utility & 5xxx/6xxx Tester: Difference 6/96

Revised: 11/12/96
Security: Everyone

52xx/62xx Diagnostic Utility & 5xxx/6xxx Tester: Difference 6/96

=====

Article Created: 19 June 1996

TOPIC -----

When I attempt to run the 52XX/62XX Diagnostic Utility on my Macintosh Performa 6290, a message appears stating: Sorry this application runs on a Macintosh 5200 or 6200 series computer. What does this mean? I thought this application was provided by Apple to see if the computer qualifies for the Repair Extension Program.

DISCUSSION -----

It appears that you are confusing two different diagnostic utilities that Apple has provided for some Power Macintosh and Performa computers: the 52xx/62xx Diagnostic Utility and the 5xxx/6xxx Tester. Although the names of these utilities are similar, they are used to test for different issues in specific computers.

The 52xx/62xx Diagnostic Utility was made available to detect an issue with a small number of PowerPC 603 microprocessors used in ONLY Macintosh Performa 5200, 6200, and Power Macintosh 5200/75 LC computers. Only computers within a specific serial number range were potentially affected by this issue. The Diagnostic Utility was posted on the online services, but it has since been removed with the posting of the 5xxx/6xxx Tester.

The 5xxx/6xxx Tester should be used to test for known component issues that may cause system freezing in ALL Power Macintosh and Performa 5200, 5300, 6200, and 6300 series computers, including the Apple Power Macintosh 5200/75 LC and 5300/100 LC, and Macintosh Performa 5200, 5215, 5300, 6200, 6205, 6214, 6216, 6218, 6220, 6230, 6290 and 6300. (The recently introduced Power Macintosh 5260 and 6320 are not included in this program because Apple corrected all the known issues with this product prior to manufacturing.) The 5xxx/6xxx Tester is available on the online services.

For additional information about the 52xx/62xx Diagnostic Utility, 5xxx/6xxx

Tester and related issues, search in the Tech Info Library using the search string "5200 and issue" to locate following Tech Info Library articles:

- "Macintosh 5200/6200: Microprocessor Issue"
- "Macintosh 5xxx/6xxx Tester: Read Me"
- "Pwr Mac 5200/5300/6200/6300:Rep. Ext. Pro. Fact Sheet/Q&A"
- "Macintosh 5200/5300/6200/6300: Repair Extension Program"

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

About Macintosh System 7.5 Read Me (6/96)

Article Created: 19 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the About Macintosh System 7.5 ReadMe file.

DISCUSSION -----

Congratulations on upgrading your computer to System 7.5, Version 7.5.3. This document adds to and updates the information that came with your upgrade kit. It is a good idea to read this document now, and keep a copy handy for future reference.

If your computer is connected to a printer, choose Print from the File menu to print a copy of this document. When you are finished reading and printing, choose Quit from the File menu to quit the SimpleText application program.

- Novell Netware
- Drive Setup
- Conflict Catcher
- Daystar Accelerator Cards
- SAM
- PowerBook-related problems
- DOS compatible-related problems
- CD-ROM related problems

Tips

====

Using the Installer

- If you use the Custom Install option to install a system for Any Macintosh, two updated enablers are installed. This is normal for the Any Macintosh option. Do not delete one or both of these enablers.
- If you use the Custom Install option to install a system for Any Macintosh, the Monitors & Sound control panel, the Monitors control panel, and the Sound control panel are all installed. This is normal for the Any Macintosh option, as some computers use the Monitors & Sound control panel, and some use the separate Monitors control panel and Sound control panel.
- If you install system software version 7.5.3 on a Quadra 630, the Screen control panel is installed even though this control panel will not work on your computer.
- If you install system software version 7.5.3 on a Power Macintosh 6100, the AutoPower On/Off and the CPU Energy Saver control panels are installed even though these control panels will not work on your computer.

General information about system software version 7.5.3

System software version 7.5.3 provides the enhancements introduced in System 7.5, System 7.5 Update 1.0, System 7.5 Update 2.0, and System 7.5.3 Revision 2.

The Installer places the latest versions of all components it finds on the disk it is updating, including any components that you disabled using the Extensions Manager. After you run the Installer, the updated components will be in the same folders as they were before you installed this system software version. For example, new versions of disabled extensions will be in the Extensions (Disabled) folder, and new versions of disabled control panels will be in the Control Panels (Disabled) folder.

The file called System 7.5 Update replaces the enabler on all computers capable of running system software versions 7.5 and/or 7.5.1. Computers that did not previously need an enabler to work with system software versions 7.5 and 7.5.1

still need the System 7.5 Update file since it contains most of the fixes delivered in this update.

The file called System 7.5.2 Update replaces the enabler file on all computers capable of running system software version 7.5.2.

This system software version includes all of the fixes included with the previously released 7.5.2 Printing Update, the PowerBook 5300 System Software Update, the PowerBook 2300c Update, System 7.5 Update 2.0, and System 7.5.3 Revision 2. You do not need these updates if you install this system software version.

After you install this software, the About This Macintosh window says "System Software 7.5.3." The window also says "Revision 2".

Using a LaserWriter LS

Many LaserWriter LS users are unaware that this printer is supported by the LaserWriter 300 driver. To make this clear, this release will install this driver as the LaserWriter 300/LS. You must select LaserWriter 300/LS from the Chooser before you can print using this driver.

Using the Recent Documents command in the Apple menu

You can easily open any of your most recently used documents by choosing the Recent Documents command in the Apple menu, then choosing a document from the sub menu. However, this feature can increase the time it takes to open some applications. This occurs because the recent-documents tracking includes all files that are opened—even those opened by an application as part of its launch sequence (such as drop-in filters used by desktop publishing packages). You can reduce the increased opening time by turning off the recent-documents tracking. You can either:

- turn off "recent documents" tracking in the Apple Menu Options control panel
- turn off Apple Menu Options in the Extensions Manager

New features in system software version 7.5.3

If you are already familiar with an earlier version of System 7.5, you should notice greater stability and performance on your computer once you install version 7.5.3. You should also note the following new features:

- Open Transport v.1.1, a major re-implementation of the network system software for use on all 68030, 68040, and PowerPC-based computers, except the desktop 5200, 5300, 6200, and 6300 series computers. If you chose the Easy Install option, Open Transport will be turned on only if you were using it before you installed the new system software version. For more information, see the Open Transport Information folder, inside the Apple Extras folder.
- The Network Software Selector (NSS) enables users of most 68030, 68040, and

early PowerPC-based computers to choose between Open Transport networking software and classic AppleTalk if both are installed. (You must restart the computer for the change to take effect.) PCI-based computers support only Open Transport. NSS is in the Apple Extras folder; information on using it is built into the application.

NSS is intended to ease the transition to Open Transport by allowing you to use the older networking software if there is a compatibility problem with an application and Open Transport. Once the problem is resolved, you should switch back to Open Transport.

NOTE: Because MacTCP is incompatible with Open Transport v.1.1, MacTCP is disabled any time Open Transport is selected using the Network Software Selector. (Open Transport uses the TCP/IP control panel instead of MacTCP.) If, however, you reselect classic AppleTalk, MacTCP will be enabled again, but you will need to re-enter the IP settings in the MacTCP control panel.

- For users of the older networking software, this update includes MacTCP 2.0.6, which

- shortens retransmission delays
- prevents potential out-of-memory errors
- makes configuring communications easier
- gives users more control over which servers to contact and in what order

NOTE: If MacTCP was not previously installed, then you will need to use the Custom Install option to install it. (IS THIS CORRECT?)

- When you rebuild the desktop, comments typed in a file's Get Info window are no longer deleted.

- The Name field (used in Finder windows set to one of the list views) is wider, allowing you to see more characters in file names.

- If you're using an alias to connect to a server and your password has expired or needs to be changed, you'll see a message that the password needs to be changed.

- PowerPC-based computers with PCI expansion slots now use the Monitors & Sound control panel, instead of the Sound & Displays control panel, to control monitor and sound settings. You can do a custom installation to install the Sound control panel if you need it for older applications. (The Monitors & Sound control panel works only on PCI-based computers.)

- The Memory control panel now uses a larger default setting for the disk cache to increase performance.

- When you open an application by double-clicking a document, you can set the default location of saved items to the folder containing the document you opened, instead of the Documents folder or the folder containing the application. You set this preference by turning on the "Folder that is set by the application" option in the General Controls panel.

- CloseView no longer uses keyboard shortcuts that were already used by the Finder. The new keyboard shortcuts for CloseView are:
 - Command-Option-K: turns CloseView on or off
 - Command-Option++ (the plus sign): increases magnification
 - Command-Option-- (the minus sign): decreases magnification
- SimpleText version 1.3.1 supports QuickDraw 3D.
- When file sharing is turned on, removable disks and CD-ROM discs are automatically shared (except for audio CDs, which will no longer be shared). To eject a removable disk or CD-ROM disc, you no longer have to turn off file sharing, as long as no other user is currently connected to that volume.
- The Power key can now be used to turn the computer off. To shut down the computer, press the Power key. When the dialog box appears, you can shut down your computer, restart your computer, put it to sleep (if your computer supports sleep), or cancel the shutdown. PowerBook 100 series computers do not have a Power key on their built-in keyboard, but if you attach an external keyboard, you can use the keyboard's Power key to turn off the computer. This feature is not supported on the Macintosh Plus.
- A new AppleScript automated task-Share a Folder (No Guest)-lets you automatically share a folder with the guest access disabled.
- Launcher version 2.8 includes the following fixes and enhancements, introduced in System 7.5 Update 1.0:
 - Supports Macintosh drag and drop, making it easier to add or remove items.

To add an item: Open the Launcher and drag the item into the Launcher window or onto a category button. The system creates a new Launcher button for the item by placing an alias in the Launcher Items folder. The original item remains on your hard disk.

To remove an item from the Launcher: Hold down the Option key and drag the button out of the Launcher.

To move a Launcher button to a new category: Hold down the Option key and drag the button to a category button along the top of the Launcher window.

To open a file using the Launcher: Drag the file's icon onto a Launcher button that represents an application program. For example, you can open a SimpleText file by dragging its icon onto the SimpleText button. If the program the button represents can open the file, the button is highlighted when you drag the file to it.

To put a file into a folder: Drag the file's icon onto the Launcher button that represents the folder.

To resize the currently visible Launcher buttons: Hold down the Command

key and click inside the Launcher window. Then choose a new size from the pop-up menu.

To open a category button's folder (located in the Launcher Items folder): Hold down the Option key and click the category button.

Known problems and their workarounds

=====

Ethernet address

PowerPC-based computers with PCI expansion slots might have a different physical Ethernet address after you install this system software version. This software fixes a bug that caused an incorrect physical Ethernet address to be used in environments where TCP/IP addresses are obtained using BootP, DHCP, or RARP. To see the new Ethernet address after you install this software, open the File menu in the AppleTalk or TCP/IP control panel and choose Get Info. If you install this software and are no longer able to use your TCP/IP-based applications, contact your network system administrator.

AppleVision

If you use AppleVision software, use version 1.0.2 or later. Earlier versions of AppleVision are not compatible with system software version 7.5.3. If you have a 1710AV monitor and a PCI-based computer, use AppleVision 1.0.4 and the Monitors & Sound control panel. If you have a 1710AV monitor and a non-PCI-based computer, use AppleVision 1.0.2, the Sound control panel, and the Monitors control panel. When you install this system software, the correct control panels should be installed.

Apple Video Player

Apple Video Player displays an incorrect dialog box if it's opened on a computer that does not have video-in capability. Apple Video Player displays a message that the Video Startup extension was not installed properly instead a message that video-in is required for the application to run.

Printing problems

- If you choose the Easy Install option, your printer driver will be updated but no new printing software will be installed. To obtain all of the most recent printer drivers after you do an Easy Install, choose Custom Install. Then check the Printing checkbox and click Install.

- If, when you try to print, you see a message that your printing preferences are missing or damaged, or you see a message telling you there is not enough memory, open the Chooser and select a printer.

- Some versions of the LaserWriter driver (version 7.2 and earlier) and the QuickDraw GX printer drivers still have the problems that interfere with PCI-based computers trying to print on a busy printer or trying to print large documents. If you experience these problems, select the LaserWriter 8.3.2 driver

from the Chooser.

Energy Saver control panels

- Two different control panels are named "Energy Saver." The older version worked by dimming the external screens of certain computers. The newer Energy Saver, which works differently, works only on PowerPC computers with PCI expansion slots.

The universal System Folder that can be created with this release (using the Any Macintosh choice in the Custom Install option) only contains the newer Energy Saver. If your universal System Folder requires both versions of the Energy Saver, do the following:

- 1) Rename the newer Energy Saver.
- 2) Use the Custom Install option to install the older Energy Saver.

Sound and speech

- HyperCard version 2.3.3 or earlier does not record sound properly on computers with PCI expansion slots. Other sound-recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within HyperCard 2.3.

- If you have a Macintosh Centris 660AV, Quadra 660AV, or Quadra 840AV, some system alert sounds may not play correctly with the alert volume turned down. To avoid the problem, keep the alert volume turned all the way up and adjust the Built-In system volume as follows:

- 1) Open the Sound control panel.
- 2) Choose Volumes from the pop-up menu.
- 3) Adjust the volume.

Problems starting your computer

If your computer has a 68000 processor and the computer won't start up, try pressing the Shift key (to turn off extensions) while you restart. If there is a "Color StyleWriter 2000 CMM" file in your Extensions folder (inside the System Folder), take this file out of the Extensions folder and restart your computer. (To use the Color StyleWriter 2000 series printer, you need a 68020 or higher processor.)

- Speech version 1.4.1 can cause a Macintosh Plus (a model which does not support speech) to hang during startup. If your Macintosh Plus hangs during startup, do the following:

- 1) Restart the computer while holding down the Space bar.
- 2) When the Extensions Manager dialog box appears, turn off Speech.

SCSI Probe

SCSI Probe's optional extension *command space* will freeze on shutdown.

AppleShare and Speed Copy

There is an incompatibility between AppleShare Workstation software version 3.6.1 and Connectix Speed Copy (part of Speed Doubler version 1.1 or earlier). Use the Extensions Manager to turn off Speed Copy before you install this system software version, and contact Connectix to get the latest version of Speed Doubler. (You can contact Connectix at <http://www.connectix.com>, 415-571-5100, or 800-950-5880.)

Novell Netware

The Ethernet Compatibility extension version 1.0.3 is installed with this system software to fix a problem in the system shutdown code that affected PCI computers connected to certain networks, such as Novell Netware. A side effect of this fix is a two-minute delay in shutting down the computer.

Drive Setup

If, when using Drive Setup on some IDE hard drives, the "Update driver," "Customize volume," and "Test disk" options are dimmed, back up all data on the IDE disk onto another disk, and use Drive Setup to reinitialize the IDE disk.

Conflict Catcher

When using Conflict Catcher, a disabled extension may be moved to the top level of your hard disk. If this happens and you try to turn on the extension in the Extensions Manager control panel, you will not be able to turn it on, even though it appears in the list.

Daystar Accelerator Cards

If you have a Power Macintosh Upgrade Card and a Daystar accelerator card installed, the Power Macintosh Card control panel will be installed, even though it is not applicable to your computer.

SAM

SAM needs to be 4.0.8 or later, which is also true for System 7.5.2.

PowerBook-related problems

-
- If you have a PowerBook 190 with Open Transport active and are using the IR port, networking may not work after you restart the computer. Try putting the computer to sleep and waking it up, or choosing the printer/modem port and then switching back to the IR port.
 - If you are making disks from the disk images included on the CD, they may not work correctly with PowerBook 5300 and 190 series computers. To use such disks on a PowerBook 5300 or 190 series computer, make sure you make the disks on that computer.
 - If you copy the Installer to a PowerBook, and then use that PowerBook in SCSI disk mode to install System 7.5.3 on another computer, it will install the

appropriate system software for the computer your PowerBook is connected to in SCSI disk mode, not for the PowerBook.

DOS-compatible-related problems

- On DOS-compatible computers, CD-ROM Setup version 5.0.4 or later does not recognize DOS-formatted CDs, unless the CD is inserted in the computer when you turn the computer on.
- When used with SerialDMA, DOS Compatibility software will not be able to use hardware handshaking on the PC serial port.

CD-ROM related problems

- You may have problems starting your computer from the System 7.5, Version 7.5.3 CD, or mounting the CD on your computer if you have an older computer, an older CD-ROM drive, or a non-Apple CD-ROM drive. If this happens, try starting up from the appropriate Disk Tools disk, then reinsert the CD, and install the software from the CD.
- The CD that comes this kit may not be automatically ejected from the CD-ROM drive when you restart your computer. If this happens, manually eject the CD.
- Digital audio recording and playback can occasionally "skip" if virtual memory is turned on. To reduce this skipping, turn off virtual memory.

Color OneScanner 600/27: Expected Lamp Life (6/96)

Revised: 6/20/96
Security: Everyone

Color OneScanner 600/27: Expected Lamp Life (6/96)

=====

Article Created: 20 June 1996

TOPIC -----

What is the expected life of the scanner lamp used in the Color OneScanner 600/27?

DISCUSSION -----

The lamp in the Color OneScanner 600/27 is a Xenon Lamp (white) and is designed to last for 100,000 scans or 5 years, which ever comes first. The lamp is not available seperately as a replacement part, but is part of the Optical Assembly, Apple Service P/N: 661-1084.

Apple Remote Access Client 2.1: Description (6/96)

Revised: 6/20/96
Security: Everyone

Apple Remote Access Client 2.1: Description (6/96)

=====

Article Created: 20 Jun 1996

TOPIC -----

This article describes Apple Remote Access (ARA) Client 2.1.

DISCUSSION -----

Apple Remote Access Client software provides an easy, productive, and secure way to connect a desktop Apple Macintosh or PowerBook computer to information and resources at a remote location. And because it works with all Apple Remote Access compatible servers -- including the Apple Remote Access MultiPort Server and Personal Server software -- it lets you choose the level of server support you need, whether you belong to a small workgroup or a multinational corporation.

Apple Remote Access Client is designed with efficiency and productivity in mind. It installs in minutes and is remarkably easy to use, minimizing the need for ongoing support. For example, the software's built-in DialAssist technology makes dialing back to the office network simple, even for international travelers. It lets you build dialing sequences that help mask the complexities of the worldwide telephone system -- so you can connect easily from anywhere in the world. And Apple Remote Access Client has features that help you manage everything from repeat connections to connection time.

In addition, because it supports the Mac OS, Apple Remote Access Client software lets you work with such familiar features as the Chooser, the Finder, and the Alias Manager. In short, it provides everything Macintosh or PowerBook users need to help them get their work done easily and efficiently -- wherever they are.

Features

Ease of use

- Lets you get started in only minutes
- Allows you to access services remotely, in the same intuitive way as you

work with services locally

- Provides built-in context-sensitive help

Adaptability

- Works with all Apple Remote Access compatible servers, including both the Apple Remote Access Personal Server and the Apple Remote Access MultiPort Server
- Supports both Apple Remote Access 1.0- and 2.0-compatible servers
- Offers a range of dialing and connection options
- Supports a variety of leading modems

Remote productivity

- Supports the Mac OS, so you can work with such familiar features as the Chooser, Finder, and Alias Manager
- Helps you manage everything from repeat connections to connection time
- Masks the complexities of the worldwide telephone system through its integrated DialAssist technology

Powerful security features

- Allows administrators to select the level of security that's most appropriate for their organization's needs (when used in conjunction with Apple Remote Access MultiPort Server software)
- Provides you with a secure method of access, whether you're connecting from home or from a hotel outside the country

Apple Remote Access Client 2.1: Technical Specifications (6/96)

=====

Article Created: 20 Jun 1996

TOPIC -----

This article provides the technical specifications for Apple Remote Access (ARA) 2.1 Client.

DISCUSSION -----

Technical Specifications

Modem support and scripts

- Modem scripts are available for a range of Hayes-compatible modems and ISDN terminal adapters.
- Additional scripts may be available. Contact your modem manufacturer for more details.
- If you understand connection control languages (CCLs) and are an experienced programmer, you may be able to write the necessary modem script yourself. The Apple Remote Access Modem Toolkit (see ordering information) includes everything you need to write these scripts.

Dialing and connection management

- Built-in DialAssist technology automatically generates dialing sequences for mobile users
- Manual or automatic dialing
- Redial or alternate number option
- Tone and pulse dialing
- Ignore dial tone option supports nonstandard telephone equipment
- Adjustable connection reminders
- Universal disconnect desk accessory

Compatibility

- Works with any Apple Remote Access-compatible server
- Supports both Apple Remote Access 1.0- and 2.0-compatible servers

Connection types supported

- Standard telephone
- ISDN2
- Cellular(2)

(2) ISDN and cellular connections require additional Apple or third-party products.

Error detection/data compression

- Includes several built-in components that allow for error-free and optimized delivery of data
 - Smart buffering (developed by Apple Computer, Inc.) for data transfer optimization
 - MNP, an industry standard for error detection
 - V.42bis, an industry standard for data compression

Specifications

- User name maximum length: 31 characters
- Password maximum length: 8 characters

System requirements

- A Macintosh computer with at least 4MB of RAM (8MB for Power Macintosh)
- Macintosh System Software 7.1 or later (version 7.5 or later required for Power Macintosh)
- An Apple or other Hayes-compatible modem (14.4 kbps or faster recommended)
- Modem cable with hardware handshaking
- Apple Remote Access Personal Server or MultiPort Server (or any Apple Remote Access-compatible server)

Ordering Information

----- Apple Remote Access Client

Order No. 402000U

ARA MultiPort Server 2.1 PCI version: Description (6/96)

=====

Article Created: 20 June 1996

TOPIC -----

This article describes Apple Remote Access (ARA) MultiPort Server 2.1 PCI version.

DISCUSSION -----

The Apple Remote Access MultiPort Server provides a flexible, scalable, and secure way to offer network access to large numbers of remote or mobile users. Used in conjunction with one or more Apple Remote Access Serial Cards, it allows a Macintosh computer or a Workgroup Server to support up to 16 simultaneous dial-up connections.¹ This provides an ideal solution for workgroups or entire organizations that want to enable employees to work productively and efficiently no matter where their location -- whether at home, out of town, or even out of the country.

Unlike conventional complex server software, the Apple Remote Access MultiPort Server is designed to streamline administrative tasks, while maximizing administrator productivity and control. The software installs in minutes and features sophisticated management capabilities, allowing administrators to flexibly manage and maintain connections. Adding ports is simple, and the server features an automatically generated activity log that can be exported to a variety of programs for further analysis.

On the client side, the Apple Remote Access Client software is also designed with efficiency and productivity in mind. From its single-step installation to such productivity-enhancing features as full Mac OS integration and extensive connection-management capabilities, it provides everything users need to help them get their work done easily and efficiently -- wherever they are.

Users can also be confident that their work will be secure. The Apple Remote Access MultiPort Server offers a host of sophisticated security features that allow administrators to maintain the integrity of the network. These features -- such as password aging, location validation, and the ability to filter access to

services -- make it one of the most secure remote access servers available. And because its security architecture is supported by leading third-party security vendors, administrators can choose to augment the server's built-in security features with additional challenge-and-response security modules.

Features

Ease of use

- Takes only minutes to set up a server and to add users or ports as needed
- Provides built-in context-sensitive help

Multilevel security

- Provides a variety of sophisticated security features, making it one of the most secure remote access servers available
- Is supported by leading third-party security vendors, so administrators can choose to augment its built-in capabilities with additional security modules

Scalable solution

- Allows a Macintosh computer, Power Macintosh computer, or a Workgroup Server to support up to 16 simultaneous dial-up connections(1)
- Runs on a variety of Macintosh computers, so you can choose the system that's appropriate for your needs

Powerful administrative capabilities

- Allows flexible port configurations
- Offers comprehensive user-management facilities
- Tracks resource usage and automatically generates an activity log that can be exported for further analysis

Flexible client capabilities

- Supports a variety of connections, including cellular and ISDN(2)
- Is fully integrated with the Mac OS, so remote users can work with such familiar tools as the Chooser, Alias Manager, and

(1) The Apple Remote Access MultiPort Server includes support for 6 ports and is available for Power Macintosh computers and Workgroup Servers with a PCI expansion bus (Mac OS based). Support for 12 or 16 ports requires purchase of 1 or 2 additional Apple Remote Access MultiPort Server packages respectively.

(2) ISDN and cellular connections require additional Apple or third-party products.

ARA MultiPort Server 2.1.1 PCI version: Specifications (8/96)

Revised: 8/28/96
Security: Everyone

ARA MultiPort Server 2.1.1 PCI version: Specifications (8/96)

Article Created: 20 June 1996
Article Reviewed/Updated: 28 August 1996

TOPIC -----

This article provides the technical specifications for the Apple Remote Access (ARA) MultiPort Server 2.1.1 PCI version.

DISCUSSION -----

Technical Specifications

Administrator control and monitoring

- Ability to monitor and manage server activity by port and user
- Ability to broadcast messages or send them to selected users
- Ability to adjust connection time by user
- Ability to disconnect any single user or all users

Security

- User name and password authentication
- Adjustable password length
- Filtering of network services by account
- Ability to disallow client use of Save Password option
- Account disable after specified number of password failures
- Password aging
- External security architecture (for example, for providing challenge-and-response authentication through a third-party security module)
- Callback feature that verifies the user's identity by returning calls to a predetermined phone number
- Activity log for recording user and server activities
- Administrative password option

Modem support and scripts

- Modem scripts are available for a range of Hayes-compatible modems and ISDN terminal adapters.

- Additional scripts may be available. Contact your modem manufacturer for more details.
- If you understand connection control languages (CCLs) and are an experienced programmer, you may be able to write the necessary modem script yourself. The Apple Remote Access Modem Toolkit includes everything you need to write these scripts.

Network types supported

- Support for any AppleTalk network; the most common network choices include:
 - LocalTalk
 - Ethernet
 - Token Ring

Connection types supported

- Standard telephone
- Cellular*
- ISDN*

* ISDN or cellular support requires additional third-party products.

Error detection/data compression

- Includes several built-in components that allow for error-free and optimized delivery of data
 - Smart buffering (developed by Apple Computer, Inc.) for data transfer optimization
 - MNP, an industry standard for error detection
 - V.42bis, an industry standard for data compression

Specifications

- Maximum number of simultaneous connections: 16
- User name maximum length: 31 characters
- Password maximum length: 8 characters
- Total number of user records: 8,192
- Maximum connect time: selectable
- Maximum number of activity log entries: 32,767

Licensing information

- Comes with license to install Apple Remote Access MultiPort software on a single Macintosh and to install Apple Remote Access Client software on up to six systems.
- Additional client software must be purchased or licensed separately; consult your authorized Apple reseller or representative for information.

System requirements

For the server side

- A Power Macintosh with 1 or more PCI expansion slots and at least 8MB of RAM
- Macintosh System Software 7.5 or later
- A hard disk drive, CD-ROM drive, and an Apple SuperDrive floppy disk drive

- Apple Remote Access Serial Card and Apple 6-port RS-232 Cable (included)
- One or more Hayes-compatible 9,600 bps/V.32 or higher-speed modems
- Apple Remote Access Client

For the client side

- A Macintosh computer with at least 4MB of RAM (8MB for Power Macintosh)
- Macintosh System Software 7.1 or later (version 7.5 or later required for Power Macintosh)
- An Apple or other Hayes-compatible modem (14.4 kbps or faster recommended)
- Modem cable with hardware handshaking
- Apple Remote Access Personal Server or MultiPort Server (or any Apple Remote Access-compatible server)

Ordering Information

Apple Remote Access MultiPort Server

Order No. 436000Z

- Apple Remote Access MultiPort Server software and installer on CD-ROM disc (includes support for six ports)
- Apple Remote Access Client software and installer on CD-ROM disc (with license to install software on up to four client systems); additional client software can be purchased separately
- PCI 6-port Serial Card
- Apple 6-port RS-232 Cable

Apple Remote Access Client

(single-pack)

Order No. 402000U

Apple Remote Access Client

Apple Remote Access Personal Server 2.1: Description (6/96)

=====

Article Created: 20 June 1996

TOPIC -----

This article describes Apple Remote Access (ARA) Personal Server 2.1.

DISCUSSION -----

Apple Remote Access Personal Server software includes everything you need to allow a Macintosh computer to communicate with another Macintosh or an entire AppleTalk network over standard telephone lines. It takes only minutes to set up and offers powerful capabilities that can help make an individual or a small workgroup of Macintosh users even more productive, no matter where they are.(1)

With Apple Remote Access Personal Server, you can work wherever you like -- at home or on the road -- and retain access to all of the resources of your office computer or network. You and your colleagues can send and receive electronic mail, collaborate on a shared project, or print to a network-connected printer. Yet doing all of this is as simple as if you were working at your office.

Getting started with Apple Remote Access Personal Server is easy. The software features single step installation that requires no special technical knowledge. And because the Apple Remote Access Personal Server adjusts automatically to your network, it leaves you free to focus on your own work instead of worrying about the details of networking.

In today's increasingly complex and mobile world, Apple Remote Access Personal Server provides convenient, direct access to information and resources at a remote location for computer users on the go. So, whether you want to share files with a neighbor or collaborate on a project with colleagues around the world, Apple Remote Access Personal Server can help you get the job done -- quickly, easily, and affordably.

Features

Ease of use

- Installs in only minutes
- Provides everything you need for both the calling and the answering Macintosh computers -- client and server software -- in one convenient package(1)
- Lets individuals or small organizations access services remotely, in the same intuitive way as they work with services locally
- Requires no specialized equipment

Adaptability

- Enables individuals or small organizations to take advantage of remote access to a single Macintosh computer or an entire AppleTalk network
- Supports a variety of leading modems
- Supports a range of network types, including LocalTalk, Ethernet, and Token Ring

High performance

- Features built-in industry standard data compression and error detection
- Provides increased efficiency, with smart buffering technology from Apple
- Is optimized for a variety of connection types

Built-in security

- Includes several security options that allow you to restrict access to information
- Generates an activity log to track usage

Flexible client capabilities

- Supports a variety of connections, including cellular and ISDN(2)
- Is fully integrated with the Mac OS, so remote users can work with such familiar tools as the Chooser, Alias Manager, and the Finder

(1) Includes software for one client. Additional client software must be purchased or licensed separately.

(2) ISDN and cellular connections require additional Apple or third-party products.

Apple Remote Access Personal Server 2.1: Specifications (6/96)

=====

Article Created: 20 June 1996

TOPIC -----

This article provides technical specifications for Apple Remote Access (ARA) Personal Server 2.1.

DISCUSSION -----

Technical Specifications

Modem support and scripts

- Modem scripts for a range of Hayes-compatible modems and ISDN terminal adapters.
- Additional scripts may be available. Contact your modem manufacturer for more details.
- If you understand connection control languages (CCLs) and are an experienced programmer, you may be able to write the necessary modem script yourself. The Apple Remote Access Modem Toolkit (see ordering information) includes everything you need to write these scripts.

Network types supported

- Support for any AppleTalk network; the most common network choices include:
 - LocalTalk
 - Ethernet
 - Token Ring

Connection types supported

- Standard telephone
- Cellular(2)
- ISDN2

Error detection/data compression

- Includes several built-in components that allow for error-free and optimized delivery of data

- Smart buffering (developed by Apple Computer, Inc.) for data transfer optimization
- MNP, an industry standard for error detection
- V.42bis, an industry standard for data compression

(2) ISDN and cellular connections require additional Apple or third-party products.

Performance

Spreadsheets, text, and files with redundant data can be compressed more efficiently than certain other files (such as programs) and can therefore be transferred at much higher rates.

Security

- User name and password authentication
- Callback feature that verifies the user's identity by returning calls to a predetermined phone number
- Activity log for recording calling and answering activities
- User account disabled after seven incorrect password attempts

Specifications

- Maximum number of simultaneous connections: (1)
- User name maximum length: 31 characters
- Password maximum length: 8 characters
- Maximum connect time: selectable
- Total number of user records: 100
- Maximum number of activity log entries: 1,000

Licensing information

- Comes with license to copy and install the Apple Remote Access Personal Server software for your own use on up to two Apple computers owned and/or operated by you.
- Additional client software must be purchased or licensed separately; consult your authorized reseller or representative for information.

System requirements

- A Macintosh computer with at least 4MB of RAM (8MB for Power Macintosh)
- Macintosh System Software 7.1 or later (version 7.5 or later required for Power Macintosh)
- An Apple or other Hayes-compatible modem (14.4 kbps or faster recommended)
- Modem cable with hardware handshaking

System 7.5, Version 7.5.3: About Disk Tools Read Me (6/96)

Revised: 6/28/96
Security: Everyone

System 7.5, Version 7.5.3: About Disk Tools Read Me (6/96)

=====

Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the About Disk Tools ReadMe file.

DISCUSSION -----

System 7.5, Version 7.5.3 comes with two Disk Tools disks:

- Disk Tools 1 - for 68K computers with SCSI hard disks
- Disk Tools 2 - for all PowerPC computers, and the following 68K computers that have IDE hard disks:

Macintosh LC 580
Macintosh LC 630
Macintosh LC 630 DOS
Macintosh Quadra 630 series computers
Macintosh Performa 580 series computers
Macintosh Performa 630 and 640 series computers
PowerBook 150 series computers*
PowerBook 190 series computers

If you have a 68K computer and have installed a PowerPC Upgrade Card, you should use the Disk Tools 2 disk.

If you insert one Disk Tools disk into your computer and you see an error message on the screen telling you the wrong Disk Tools disk was inserted, use the other Disk Tools disk.

Using Drive Setup

This Disk Tools 2 disk comes with a new version of Drive Setup (version 1.0.4) that fixes a problem that occurred with some types of IDE hard disks. If your

computer has an IDE hard disk, you should update your driver as part of the installation of this software. When using Drive Setup on some IDE hard disks, the "Update driver," "Customize volume," and "Test disk" options are dimmed. To use these options, back up all data from the IDE disk onto another disk, and use Drive Setup to reinitialize the IDE disk.

*Special note about PowerBook 150 series computers

You do not need to update the driver on your hard disk (as described in the user's manual) with Drive Setup. (The driver on your computer is contained in its ROM.)

System 7.5, Version 7.5.3: Installing OpenDoc Read Me (6/96)

Revised: 6/28/96
Security: Everyone

System 7.5, Version 7.5.3: Installing OpenDoc Read Me (6/96)

Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the Installing OpenDoc ReadMe file.

DISCUSSION -----

OpenDoc technology supports a new type of software called a "part." You use parts to easily add new features to your applications. You add features by dragging parts into documents created by any OpenDoc-aware application. You can also create documents entirely out of OpenDoc parts.

Installing OpenDoc

To install the OpenDoc libraries and extensions that will enable you to use OpenDoc parts, double-click the OpenDoc Installer alias.

When the Easy Install dialog box appears, click Install.

NOTE: To install OpenDoc, you must be using system software version 7.1.1 or later for a 68K Macintosh, or system software version 7.1.2 for a Power Macintosh.

Installing over previous versions of OpenDoc

Before installing over an older version of OpenDoc, turn extensions off by holding down the Shift key as you restart the computer.

Getting more information

For more information about OpenDoc and developers who are producing both OpenDoc parts and OpenDoc-aware applications, look on the World Wide Web at <http://opendoc.apple.com>.

System 7.5, Version 7.5.3: Installing PowerTalk ReadMe (6/96)

Revised: 6/28/96
Security: Everyone

System 7.5, Version 7.5.3: Installing PowerTalk ReadMe (6/96)

=====

Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the Read Me for Installing PowerTalk file that comes with System 7.5, Version 7.5.3.

DISCUSSION -----

If you have System 7.5 installed and your Macintosh has at least 8 megabytes (MB) of memory, you can install PowerTalk.

Step 1: Install PowerTalk Software

IMPORTANT: If At Ease software is installed on your computer, you must turn it off before you install PowerTalk. For instructions, see the manual that came with your At Ease software.

- 1) Quit any open application programs or desk accessories.
- 2) Locate the PowerTalk folder, and open the folder by double-clicking its icon.
- 3) Open the PowerTalk Installer by double-clicking its icon.

All PowerTalk files are compressed. The Installer program will expand them during installation. Do not drag them to your hard disk.

- 4) If you see a dialog box asking what you want to install, click PowerTalk.
- 5) When you see the PowerTalk Installer's welcome screen, click Continue.

The Install PowerTalk dialog box appears.

- 6) Make sure that the destination disk indicated on the screen is the one on which you want to install PowerTalk.

If the wrong disk name appears, click the Switch Disk button until the correct disk name appears.

- 7) Click Install.

The Installer places PowerTalk software on your hard disk. PowerTalk software includes system software (installed in your System Folder) and application programs (installed in the PowerTalk folder, inside the Apple Extras folder on the hard disk).

- 8) Follow the instructions on the screen.

On-screen messages report the installation status. It takes a few minutes to complete.

- 9) When the installation is complete, restart your computer.

If for some reason the installation was not successful, try again.

New icons on your screen

Once your PowerTalk software is installed and you have restarted your computer, two new icons appear on your screen.

The Mailbox is the place where all correspondence resides. To look at your In Box or Out Box, you open the Mailbox. (After you set up your system, the word Mailbox changes to your name.)

The Catalogs icon opens to show all the catalogs to which you have access—AppleTalk, PowerShare servers, and any other services on your network.

Step 2: Set Up Your System

PowerTalk system software provides different levels of access security. The most basic safeguard is the key chain access code. Your access code provides access to all your network servers and services with a single password. Until you set up and use your access code, your catalog and mail services are locked (inaccessible).

IMPORTANT: How you set up your system depends on whether you have access to a server (called the PowerShare server) that manages network communications. If you are not sure whether or not you have a PowerShare server account, assume that you do not.

Setting up without a PowerShare server account

PowerTalk does not require the use of a network server. When you set up without a server account, you can communicate using AppleMail or mail-capable applications.

If you don't have a PowerShare server account, follow these steps:

- 1) Choose Unlock Key Chain from the Special menu in the Finder.

If you wish, you can also open the Mailbox.

The welcome screen appears.

- 2) Read the screen and click Proceed.

A dialog box appears, asking if you have a PowerShare account.

- 3) Click No.

A dialog box appears, asking you to set your key chain access code.

- 4) Type your name and the access code you want to use.

IMPORTANT: Once your access code is set, you enter it each time your computer starts up. You can leave the access code blank, if you do not want to use a password.

Here are some tips for choosing an access code:

- It should not be your name.
- It must be at least six characters long. (The longer it is, the harder it will be to guess.)
- Mix upper- and lowercase letters and use numbers, as in "4Me!Only."
- Make it easy to remember and don't write it down.
- Keep track of which letters are uppercase—the access code is case-sensitive.

- 5) When a confirmation dialog box appears, type your access code again and click OK.

You can change your access code at any time in the PowerTalk Setup control panel.

- 6) When you see the next confirmation box, click OK.

As soon as the confirmation box closes, open your Date and Time control panel and make sure that the date, time, and time zone are all set correctly.

You now have access to PowerTalk services. The name of your Mailbox changes to show that you are its owner.

Setting up with a PowerShare server account. If you have access to a PowerShare server, follow these steps:

- 1) Choose Unlock Key Chain from the Special menu in the Finder.

If you wish, you can also open the Mailbox.

The welcome screen appears.

- 2) Read the screen and click Proceed.

A dialog box appears, asking if you have a PowerShare account.

- 3) Click Yes.

The computer searches for the PowerShare services available to you.

- 4) When the navigation dialog box appears, select the PowerShare service you want to access and click OK.

You can also double-click the PowerShare service's name.

A dialog box appears, asking for account information.

- 5) Type your name and the password of your PowerShare account as set up by your system administrator.

As a convenience to you, PowerTalk software initially sets your key chain access code to be the same as your PowerShare password. (You use your access code to open all services.) You can change your key chain access code in the PowerTalk Setup control panel.

IMPORTANT: Changing your key chain access code does not change your PowerShare password. You'll need to use your PowerShare password when you check your mail from a computer other than your own.

- 6) When you see the confirmation box, click OK.

After a moment another confirmation box appears with additional information. Click OK.

You now have access to PowerTalk services. The name of your Mailbox changes to show that you are its owner.

Step 3: Name your computer on the network

If you are on an AppleTalk network, the name of your computer appears in the AppleTalk catalog, and people can send you mail at that "address" without the need for a PowerShare server. If you name your computer clearly in the Sharing Setup control panel, people can find your address more easily. Many people use their own names in naming their computers (for example, "Sarabeth Herman's Macintosh").

To check the name of your computer, follow these steps:

- 1) Choose Control Panels from the Apple menu.
- 2) Open Sharing Setup.

- 3) Add any missing information, or change the current information by selecting and retyping.

Make sure that the name in the Macintosh Name text field is accurate; this information defines your network identity.

IMPORTANT: If you have more than one computer on the same network, be certain that the computer names are different.

- 4) Close the Sharing Setup control panel by clicking its close box.

IMPORTANT: If you want to use your AppleTalk catalog and the network, be sure that AppleTalk is turned on in the Chooser.

Turning off PowerTalk

To turn off collaboration services for an extended period, click the Off button in the PowerTalk Setup control panel and restart your computer.

When you choose this option, collaboration services won't be available at all when you restart the computer. (Your Mailbox and Catalogs will not appear on the desktop.) You'll use this option when you know that you won't be needing PowerTalk services and accounts on a particular personal computer for a while. You may also use it to save memory, since PowerTalk uses no memory when it is turned off.

To turn PowerTalk back on, open the PowerTalk Setup control panel, and click the On button. Then restart your computer.

This article is the Before You Install QuickDraw GX Read Me file for System 7.5, Version 7.5.3.

DISCUSSION -----

Before You Install QuickDraw GX
=====

Printing and Faxing from QuickDraw GX

To print with QuickDraw GX, you need a QuickDraw GX printer driver for your printer.

- If you have an Apple printer, the QuickDraw GX versions of your currently installed printer drivers are installed with the QuickDraw GX software. All Apple printers (except the Apple Color Printer, and Color StyleWriter Pro) have GX drivers. The Color StyleWriter Pro will have a GX driver available soon.
- If you have a non-Apple printer, check with your Apple-authorized dealer or contact your printer vendor directly to make sure that you have the right printer driver for your printer. For printer vendor contact information, see the "QuickDraw GX Printer Driver Upgrade Information" section below.
- The AppleTelecom 2.0 package—with Express Modem and GeoPort fax drivers—is compatible with QuickDraw GX. For more information, see the "QuickDraw GX Fax Information" section later in this file.

QuickDraw GX and WorldScript I and WorldScript II

Make sure that you are using WorldScript I and WorldScript II version 7.5.1 or later. QuickDraw GX is not completely compatible with versions of WorldScript I

and WorldScript II prior to 7.5.1.

QuickDraw GX and At Ease

Make sure that you are using At Ease version 2.0.3.

QuickDraw GX Printer Driver Upgrade Information

=====

If you are using a non-Apple printer, use the information below to contact the vendor about a printer driver upgrade. If your printer's vendor is not listed here, see the manual that came with your printer for contact information.

CalComp

PostScript compatible printers from CalComp should work with the standard LaserWriter GX PostScript driver. If you have any problems using QuickDraw GX with CalComp products and are within the United States or Canada, call CalComp at 800-451-7568. Outside the United States or Canada, contact the office in your area as listed in an appendix of your User's Guide.

Epson America

For information about Epson QuickDraw GX drivers, call the Epson End User Support Center at 1-800-922-8911.

GCC Technologies

For information about GCC QuickDraw GX drivers and upgrade information contact GCC Technical Support at one of these numbers:

Phone Number: 617-276-8620
Fax Number: 617-275-1115
CompuServe: 67004,2302
GEnie: GCC.TECH
America OnLine: GCC TECH

GDT Softworks Inc.

For upgrade information about GDT Softworks products (PowerPrint 2.5, PowerPrint/GX 3.0, PowerPrint/LT 3.0, PowerPrint/NW 3.0, PLOTTERgeist 3.0, PowerPlot 2.0, PowerPlot/LT 2.0, StyleScript 2.0), contact GDT:

GDT Softworks Inc.
Customer Service Upgrades
4664 Lougheed Highway, Suite 188
Burnaby, BC V5C 6B7 Canada

Phone Number: 1-800-663-6222 or 604-291-9121
Fax Number: 604-291-9689
CompuServe: 72137,3246
Internet: customer_service@gdt.com

Hewlett-Packard

If you need Post-Sale Assistance, Technical Assistance, or if you have any kind of questions about H-P peripherals, contact the H-P Computer Products Customer Support Center at 208-323-2551.

For users of DeskWriter 500 series printers, the fastest way to get a QuickDraw GX printer driver is from one of these electronic on-line services:

CompuServe: HP Peripherals forum (HPPER)

Library 9

Internet: IP address - 192.6.71.2

Name - Anonymous

Password - Send User Identification

HP Download Service: 208-344-1691 (modem settings: parity, N; data bits, 8; stop bits, 1)

To receive detailed instructions on accessing these on-line services, contact HP FIRST, Hewlett-Packard's document FAX retrieval service:

Inside the U.S. and Canada: 1-800-333-1917 (Then press 1 for HP FIRST.)

Outside the U.S. and Canada: 208-344-4809

To receive a disk with the QuickDraw GX printer driver, contact the HP Software Distribution Center at 303-339-7009. A nominal charge for materials and shipping applies.

Kodak

Call 1-800-CDKODAK, for technical support. To update and provide discussion for EKC drivers and print utilities, log on to CompuServe and 'go kodak'. In the Library menu, select browse and in the browse sections, select Kodak Printers. You can download these upgrades from CompuServe!

Lasermaster

For QuickDraw GX driver updates from Lasermaster, call Lasermaster Technical Support at 612-944-8509.

Lexmark International

Lexmark/IBM customers can get the latest QuickDraw GX drivers from:

Technical Support: 606-232-3000

Lexmark Bulletin Board: 606-232-5238

Internet: anonymous ftp at ftp.lexmark.com

CompuServe: Go Lexmark

Microspot

For information about "MacPlot Raster GX" and "MacPlot Pen Plotter Professional GX" Chooser level GX drivers or upgrade information, contact the Sales Department:

Microspot
12380 Saratoga-Sunnyvale Road, Suite 6
Saratoga, CA 95070

Phone Number: 1-800-622-7568 (1-800-MACPLOT) or 408-257-4000
America OnLine: MICROSPOT1
CompuServe: 70274,3650

NEC Technologies

Contact NEC Technical Support at 800-388-8888 or use one of the following:

NEC Bulletin Board: 508-635-4706
Main Phone Number: 508-264-8000
Main FAX Number: 508-264-8673

QMS, Inc.

For assistance with QMS printers, drivers, and driver updates, call QMS Customer
Technical Assurance:

Phone Number: 205-633-4500
FAX Number: 205-633-3716

Seiko Instruments

QuickDraw GX is supported by Seiko Instruments for the ColorPoint PostScript
printer line with four drivers:

Begin_Table

Printer Names	Required GX Driver
-----	-----
ColorPoint PS, PSX or PSN	ColorPoint PS/PSX/PSN GX driver
ColorPoint PSE	ColorPoint PSE GX driver
ColorPoint PSH	ColorPoint PSH GX driver
ColorPoint PSF	ColorPoint PSF GX driver

End_Table

All driver upgrades are free and are available now:

Technical Support Department: 1-800-553-5312 (inside USA)
Technical Support Department: 408-922-5800
Seiko Bulletin Board: 408-428-9810

SuperMac Technology

For the SuperMac ProofPositive and the SuperMac Splash -- contact SuperMac
Technical Support at 1-800-541-7680.

Tektronix

In the US and Canada, call Customer Support at 1-800-835-6100 or use the following:

Fax Number: 503-682-2980

Tektronix Bulletin Board: 503-685-4504

International Customers: Please contact your local Tektronix office

Xerox

Xerox offers QuickDraw GX printer drivers for Xerox DocuTech Network Publisher Model 90 and Xerox DocuTech Network Publisher Model 135. For information on how to obtain the driver, customers can send an electronic mail message to:
GX.Roch817@Xerox.com

QuickDraw GX Fax Information

=====

To fax with QuickDraw GX, you need a QuickDraw GX fax driver for your modem. Use the information below to contact the vendor about a fax driver for your modem.

Apple Telecom 2.0

This package includes Express Modem version 2.0 and GeoPort version 2.0, both of which support QuickDraw GX. To order the Apple Telecom 2.0 upgrade, call 1-800-769-2775 and ask for the Apple Telecom 2.0 upgrade. You can also get the upgrade from the following online services:

CompuServe: GO APLSUP

America OnLine: keyword ftp, then connect to ftp.info.apple.com

FTP: ftp.info.apple.com

Web: <http://www.info.apple.com>

Global Village

GlobalFax version 2.5 supports QuickDraw GX. If you purchase a modem that includes GlobalFax 2.5 software, it will automatically install the GlobalFax GX fax driver as part of the standard installation. If you are using an older version of GlobalFax software, you can buy a GlobalFax 2.5 Upgrade from Global Village by calling 1-800-736-4821 or 1-408-523-1036. For more information about GlobalFax software, check Global Village forums on the following online services:

America Online: global

CompuServe: go global

Global Village BBS: 415-390-8334

Web: <http://www.globalvillag.com>

Cypress Research

If you use Cypress Research FaxPro II, call 408-752-2700 and ask for Technical Support.

STF Technologies

For information about our "FaxPrint GX" printer driver contact STF Customer Service:

Phone Number: 816-463-2021
Fax Number: 816-463-7958
Bulletin Board: 816-463-1131
CompuServe: 74740,1244 (Go STFtech)
America OnLine: STFtech

Using Fonts

=====

Type 1 Fonts Enabled During Installation

During installation, QuickDraw GX enables any Type 1 fonts found in the System Folder, the Fonts folder, or the Extensions folder. However, you must ensure that each Type 1 font family is in its own suitcase. The installer enabler will not enable your Type 1 fonts if multiple font families are contained in one suitcase. QuickDraw GX does the following:

- creates a new folder called •Archived Type 1 Fonts• in your Fonts folder
- moves all suitcases referring to Type 1 fonts to the •Archived Type 1 Fonts• folder
- moves all Type 1 outline font files to the •Archived Type 1 Fonts• folder
- makes a copy of the original suitcase and puts the copy in the Fonts folder
- creates one or more 'sfnt' font resources from the corresponding Type 1 outline font files and places the resources into the suitcase in the Fonts folder

The 'sfnt' (scalable font) resource was originally specified to contain TrueType font data. When QuickDraw GX enables a font, the 'sfnt' resource may contain either TrueType font data or PostScript Type 1 font data.

You can find instructions for installing QuickDraw GX in the Macintosh System 7.5 Upgrade Guide.

Adobe Type Manager version 3.8.2

ATM version 3.8.2 is installed with this version of QuickDraw GX. ATM 3.8.2 includes native support for Power Macintosh computers.

Type 1 fonts will display and print properly only if ATM is installed and turned on. As with previous versions, ATM 3.8.2 rasterizes Type 1 font data from the POST resource in conventional outline font files (file type LWFN). In addition, ATM 3.8.2 rasterizes Type 1 font data from the 'sfnt' resource in suitcase files (file type FFIL). ATM 3.8.2 does not include font substitution capability.

Enabling Type 1 Fonts After Installation

You may need to enable Type 1 fonts that are not located in the System Folder, the Fonts folder, or the Extensions folder. Or you may need to enable Type 1 fonts installed after you install QuickDraw GX. To enable Type 1 fonts, use the Type 1 Enabler (one of the QuickDraw GX Utilities). You must ensure that each Type 1 font family is in its own suitcase. The Type 1 Enabler will not enable your Type 1 fonts if multiple font families are contained in one suitcase.

To install the QuickDraw GX Utilities and enable Type 1 fonts, see the instructions in Chapter 3 ("Installing QuickDraw GX") of the Macintosh System 7.5 Upgrade Guide.

The Type 1 Enabler supports only Type 1 fonts. If the Type 1 Enabler program encounters a suitcase containing Type 3 fonts, it displays the message "Contains a Type 3 font program" and does not enable the suitcase.

The Type 1 Enabler does not enable hybrid fonts. If you see the message "Contains a hybrid font program (see README file for details)" when the Type 1 Enabler attempts to enable Optima or ITC Eras, it may be because you have an old version of these fonts. These fonts cannot be enabled because they are hybrid fonts. If you are a registered owner of Optima or ITC Eras, call Adobe Systems Technical Support to obtain an upgrade to the non-hybrid versions of these families.

Removing Duplicate Fonts

To make sure that QuickDraw GX properly manages currently installed fonts, you should make sure you have no duplicate fonts installed in the System Folder. Remove any duplicates that you find.

System 7.5, Version 7.5.3: PowerPC/PCI Printing Read Me (6/96)

Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the PowerPC/PCI Printing ReadMe file which comes with System 7.5, Version 7.5.3.

DISCUSSION -----

Important Information About Printing with a PowerPC PCI-Based Computer on non-Apple Printers

PowerPC-based computers with PCI expansion slots may have difficulty printing to some third party network printers or print spoolers in certain network configurations. When printing to one of these devices, your computer may freeze or never complete printing, and you may need to restart your computer or cancel the printing job.

LaserWriter 8.3.4 addresses this problem.

When it's available, LaserWriter 8, version 8.3.4 can be obtained at:

http://www.support.apple.com/wwwdocs/apple_sw_updates.html.

Security: Everyone

System 7.5, Version 7.5.3: What's New in Version 7.5.3 (6/96)

=====

Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the What's New in Version 7.5.3 Read Me file.

DISCUSSION -----

If you already have System 7.5 and are installing to update to version 7.5.3, the following new features are available (either with the Easy Install option, or for OpenDoc, with its own Installer):

- All previously-installed system software components are updated to the latest versions, including any components that you disabled using the Extensions Manager. You will also find performance improvements for some PowerPC-based computers. Some of these improvements are due to the addition of more native system software components, including Apple Guide, the Resource Manager, and the SCSI Manager.
- When dragging icons on PowerPC computers, you will see a translucent image of the icon instead of an outline.
- A new version of Drive Setup (version 1.0.4) fixes a problem that occurred with some types of IDE hard disks. If you use an IDE (ATA) hard disk, you should update your driver as part of the installation of this software. When using Drive Setup on some IDE hard disks, the "Update driver," "Customize volume," and "Test disk" options are dimmed. To use these options, back up all data from the IDE disk onto another disk, and use Drive Setup to reinitialize the IDE disk.
- Open Transport networking software provides improved network flexibility and performance. Open Transport is available on all computers with 68030, 68040, or PowerPC processors, except for the desktop 5200, 5300, 6200, and 6300 series computers. Open Transport may require more RAM than classic AppleTalk.

After you install system software version 7.5.3, Open Transport will be turned

on only if you were using it before you installed the new system software. You can turn on Open Transport with the Network Software Selector program (in the Apple Extras folder after you install the new system software).

For more information, see the Open Transport Information folder, inside the Apple Extras folder.

- Text-to-Speech software is automatically installed. If you don't use this software, you can use the Extensions Manager to turn off MacInTalk (version 2 or 3) and the Speech control panel.

- You have the option to install OpenDoc, a new plug-in software architecture for the Mac OS. OpenDoc technology supports a new type of software called a "part." You use parts to easily add new features to your applications. You add features by dragging parts into documents created by any OpenDoc-aware application. You can also create documents entirely out of OpenDoc parts. A variety of these parts will be available from both Apple and third-party sources, including parts for placing Internet resources directly into documents. No parts come with this upgrade kit.

- When you rebuild the desktop, comments typed in a file's Get Info window are no longer deleted.

- Many previously-released fixes are also included in this system software version, including those in the 7.5.2 Printing Update, the PowerBook 5300 System Software Update, the PowerBook 2300c Update, System 7.5 Update 2.0, and System 7.5.3 Revision 2.

For an overview of all the features in System 7.5, see the manual that came with your upgrade kit.

Power Macintosh 5400: Compatible w/ QuickTime Conf.? (6/96)

Revised: 6/20/96
Security: Everyone

Power Macintosh 5400: Compatible w/ QuickTime Conf.? (6/96)

=====

Article Created: 20 June 1996

TOPIC -----

I am attempting to install QuickTime Conferencing 1.0.2 (from the QuickTime Conferencing 1.0 CD) on my Power Macintosh 5400/120 computer. Each time I do so, an error message appears reporting that Network Software Installer 1.5 or later is required. However, when I then attempt to install Network Software Installer 1.5, another message appears stating: The file 'Network' on disk 'Macintosh HD' cannot be replaced by the Installer. No installation will take place. Please move the file to another folder and try again."

I cannot locate a file called "Network" on my hard drive, so I am unable to perform the installation. What can I do? Is QuickTime Conferencing compatible with the Power Macintosh 5400/120?

DISCUSSION -----

QuickTime Conferencing v1.0.2 is not compatible with the Power Macintosh 5400/120. Instead, you should install QuickTime Conferencing v1.0.3, which is in the Apple Extras folder on the hard drive of the Power Macintosh 5400 Series CD.

Mac System 7.5.3: About the Control Panels Folder ReadMe (6/96)

Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the About the Control Panels Folder Read Me file.

DISCUSSION -----

Macintosh System 7.5.3, What's Inside the Control Panels Folder?

About this document

If you're curious about the contents of the Control Panels folder, this document provides a brief description of each control panel. You can use these descriptions to help determine which control panels you may need and which ones you may not need.

What is a control panel?

A control panel is a small piece of software that allows you to change your computer's settings to meet your needs. For example, you can change the pattern or color of your computer's desktop using the Desktop Patterns control panel.

You can use the Extensions Manager control panel to turn off any control panel you don't need on your computer.

Depending on the type of computer you have, the contents of your Control Panels folder may vary. You might have control panels that were added by third-party applications, and you don't need all the control panels described below. For complete instructions on using control panels, see Macintosh Guide, available in the Guide (question mark) menu when the Finder is the active program.

- Apple Menu Options: You can turn the submenus available in the Apple menu (for recently used documents, programs and servers) on or off. You can also set the number of items that will appear in the menus. Works on all Mac OS-based

computers that use System 7.5.

- **AppleTalk:** You can specify AppleTalk settings (such as connection port and zone) for use with Apple's Open Transport networking. When you install Open Transport, the Network and MacTCP control panels are replaced with the AppleTalk and TCP/IP control panels. Works on all Mac OS-based computers that support Open Transport.

- **ATM GX:** Makes your Type 1 fonts look sharp and clear at any point size—both on your screen and on paper. Improves the output of QuickDraw printers, such as the ImageWriter and StyleWriter series. Works on all Mac OS-based computers that use System 7.5

- **Auto Power On/Off:** You can specify dates and times for your computer to automatically turn on or off, set a warning interval before turning off, and specify that your computer automatically restart after a power failure. Works only on computers that can be turned on from the keyboard (does not work on Macintosh PowerBook 500 models).

- **AutoRemounter:** You can turn off the Losing Network Services message that appears when your PowerBook sleeps. You can also automatically reconnect your computer to any shared disks that were disconnected when your PowerBook went to sleep. Works on all Macintosh PowerBooks except models 100, 140, 145, 145B, and 170.

- **Brightness:** You can adjust screen brightness. Works on Mac OS-based computers with onscreen brightness control, such as the Macintosh Classic and Classic II.

- **Button:** You can disable the built-in volume and contrast buttons on the front of your computer. Useful in classroom situations with young students. Works on the Macintosh Performa and Macintosh LC 500 series of computers.

- **Cache Switch:** You can turn processor caching for 68040-based Mac OS-based computers on or off. For compatibility reasons, processor caching may need to be turned off for some applications. Works on all 68040-based Mac OS computers, such as the Macintosh Quadra, Macintosh Centris, and Performa 400/500 models.

- **Color:** You can set the color of highlighted text and window borders. Works on all Mac OS-based computers that use System 7.5 and have a color monitor.

- **CloseView:** You can magnify your computer display for easier viewing. Works on all Mac OS-based computers.

- **ColorSync System Profile:** Part of the ColorSync system that provides consistent color across various types of equipment (printers, scanners, monitors, and so on). In the control panel, you can view and select ColorSync profiles. Works on all Mac OS-based computers that support ColorSync.

- **Control Strip:** You can display or hide the Control Strip, and specify a font for Control Strip menus. With the Control Strip, you can control a variety of settings directly from your desktop, such as sound volume, monitor resolution, file sharing, and so on. Works with all Mac OS-based computers that use System 7.5.

- **Date & Time:** You can set the date, time, and time zone on your computer. You can also set how dates and times are displayed. Works with all Mac OS-based computers that use System 7.5.
- **Desktop Patterns:** You can change the pattern or color of your computer's desktop. Works with all Mac OS-based computers that use System 7.5.
- **Easy Access:** You can press keys used in keyboard combinations one at a time (Sticky Keys), move the pointer using the numeric keypad (Mouse Keys), and set typing speed with audible response (Slow Keys). Works on all Mac OS-based computers that use System 7.5.
- **Extensions Manager:** You can turn your computer's system extensions on or off. Extensions include items in the Extensions folder, control panels, and other startup programs in the System Folder. Works on all Mac OS-based computers that use System 7.5.
- **File Sharing Monitor:** When file sharing is turned on, this control panel displays a list of users who are connected to your computer. Works on all Mac OS-based computers that use System 7.5.
- **General Controls:** You can set various options, including desktop hiding, Launcher visibility at startup, folder protection to prevent folders and files from being deleted, insertion point blinking rate, menu selection blinking, and the default folder that appears in the Save dialog box. Works on all Mac OS-based computers that use System 7.5.
- **Keyboard:** You can set the repeat rate and delay before repeat for your keyboard. Also lets you switch keyboard layouts. Works on all Mac OS-based computers that use System 7.5.
- **Labels:** You can customize the color and text of file labels. (You can see labels in the Finder.) Works on all Mac OS-based computers that use System 7.5.
- **Launcher:** You can open the Launcher window, where you can easily find and open programs. You can add items to the Launcher by placing an alias to your favorite applications, files, or folders in the Launcher Items folder in the System Folder.
- **MacTCP:** You can control how your computer is connected to network services (such as the Internet) that use TCP/IP protocol. Works on Mac OS-based computers that use System 7.5. Does not work with Open Transport.
- **Macintosh Easy Open:** You can customize the way a Mac OS or DOS/Windows document is translated, so you can open a document when you do not have the application that was used to create the document. Works on Mac OS-based computers that use System 7.5.
- **Map:** You can locate popular cities around the world, and display longitude and latitude coordinates and local time. Lets you set the location of your computer. Works on all Mac OS-based computers that use System 7.5.

- **Memory:** You can control memory settings, including disk cache, virtual memory, and RAM disk configuration. Works on all Mac OS-based computers that use System 7.5. Do not remove this control panel if you use a RAM disk.
- **Monitors:** You can set the number of colors or shades of gray that are displayed. Sets monitor resolution for multiple scan monitors. On some Mac OS-based computers, the Monitors control panel is replaced by the Monitors & Sound control panel.
- **Monitors & Sound:** A combined control panel that replaces the separate Sound and Monitors control panels. (It also replaces the Sound & Displays control panel.) You can use this control panel to specify information about monitors attached to your computer (for example, monitor resolution, monitor bit depth, monitor arrangement, and so on). You can also use this control panel to specify information about other audiovisual equipment attached to your computer (for example, audio CD players, VCRs, video cameras, external speakers, and so on.) Works on PowerPC-based computers with PCI slots.
- **Mouse:** You can set the tracking speed and double-click speed for your mouse. Works on all Mac OS-based computers that use System 7.5.
- **Network:** You can choose between network options installed on your computer. Typical choices are LocalTalk, Ethernet, or Token Ring. Works on all Mac OS-based computers that use System 7.5. Does not work with Open Transport.
- **Numbers:** You can control how numbers and currencies are displayed on your computer (for example, where decimal points appear). Works on all Mac OS-based computers that use System 7.5.
- **PC Exchange:** Allows your Mac OS-based computer to read files from ProDOS and MS-DOS disks. You can specify the Mac OS application program used to open a DOS document. You can also use SyQuest and Bernoulli disks on your desktop. Works on all Mac OS-based computers that use System 7.5.
- **PC Setup:** You can set options for the DOS Compatibility Card. Works on all Mac OS-based computers that support the DOS Compatibility Card.
- **Power Macintosh Card:** Used with 68040-based Mac OS computers that have an expansion card with a PowerPC processor. You can select which processor to use. Works on all Mac OS-based computers with a Power Macintosh Upgrade card.
- **PowerBook:** You can set PowerBook-specific items, including hard disk sleep, system sleep, and screen dimming. You can also set processor cycling and (on certain computers) reduced processor speed. Controls backlight intensity and built-in video. Works on all Macintosh PowerBooks.
- **PowerBook Display:** You can duplicate the images on your PowerBook display on an external monitor. Useful for controlling a presentation from your PowerBook while displaying the presentation on a large room monitor. Works on the Macintosh PowerBooks 160, 165c, 180, 180c, 200, and 500 models.
- **PowerBook Setup:** You can set a unique SCSI ID number for your PowerBook when you're using SCSI disk mode. You can also specify a Normal or Compatible modem

setting for your PowerBook. Use Normal for communication applications that are compatible with the Macintosh Communications Toolbox. Use Compatible for communication applications that are not compatible with the Communications Toolbox. Works on all Macintosh PowerBook 200 and 500 models.

- **PowerTalk Setup:** You can turn collaboration services on or shut them off after a period of inactivity. You can also access your Key Chain. Works on all Mac OS-based computers that support PowerTalk.

- **Screen:** You can control brightness and contrast for a built-in monitor. Works on all Mac OS-based computers with built-in monitors, such as the Macintosh Performa 400/500 models.

- **Serial Switch:** Provides compatibility for some applications that use the printer or modem port. You can set the serial port option to Faster or More Compatible. Works on Macintosh IIfx and Macintosh Quadra 950 computers.

- **Sharing Setup:** You can set file sharing options and specify a network name for your computer. Works on all Mac OS-based computers that use System 7.5.

- **Sound:** You can set the alert sound and volume and specify a sound input and sound output source for your computer. On PowerPC-based computers with PCI slots, this control panel is replaced by the Monitors & Sound control panel.

- **Sound & Displays:** A combined control panel that replaces the separate Sound and Monitors control panels. (In System 7.5.3, Sound & Displays is replaced with the Monitors & Sound control panel.) You can use this control panel to specify information about monitors attached to your computer (for example, monitor resolution, monitor bit depth, monitor arrangement, and so on). You can also use this control panel to specify information about other audiovisual equipment attached to your computer (for example, audio CD players, VCRs, video cameras, external speakers, and so on). Works on PowerPC-based computers with PCI slots.

- **Speech:** You can set options for hearing text read aloud by the computer. If you have Speakable Items software and a PlainTalk-compatible microphone, you can set options for giving spoken commands to the computer. Works on all Macintosh 660AV and 840AV computers. Also works on all PowerPC-based AV computers.

- **Startup Disk:** You can select the disk used to start up your computer. Works on all Mac OS-based computers that use System 7.5.

- **TCP/IP:** You can specify TCP/IP settings for use with Apple's Open Transport networking. When you install Open Transport, the Network and MacTCP control panels are replaced with the AppleTalk and TCP/IP control panels. Works on all Mac OS-based computers that support Open Transport.

- **Text:** You can select from the text features for the script systems installed on your computer. Works on all Mac OS-based computers that use System 7.5.

- **Trackpad:** You can set how far the pointer moves when you move your finger on the trackpad, and how fast you double-click. Works on all Macintosh PowerBook 500/5000 models.

- Users & Groups: You can specify who can access your computer's hard disk when file sharing is turned on. Works on all Mac OS-based computers that use System 7.5.
- Views: You can customize how information is displayed in Finder windows. Works on all Mac OS-based computers that use System 7.5.
- WindowShade: You can set whether to hide a window by clicking on its title bar. Works on all Mac OS-based computers that use System 7.5.

Security: Everyone

System 7.5.3: What Updates Do I Need for System 7.5.5? (1/97)

Article Created: 20 June 1996
Article Reviewed/Updated: 27 January 1997

TOPIC -----

My Power Macintosh computer included System 7.5.3 pre-installed on the hard drive. However, I have heard that the pre-installed version of System 7.5.3 is not the same as the version of System 7.5.3 that you get by installing System 7.5 Update 2.0.

- 1) Does this mean I also need to install System 7.5 Update 2.0?
- 2) Do I then need to install System 7.5.3 Revision 2 as well?
- 3) Can I skip System 7.5 Update 2.0 and just install Revision 2?
- 4) What is System 7.5 Version 7.5.3?

DISCUSSION -----

- 1) Question: Does this mean I also need to install System 7.5 Update 2.0?

Answer: Although your computer has System 7.5.3 pre-installed, you should still install System 7.5 Update 2.0. System 7.5 Update 2.0 includes some additional fixes that are not included with the pre-installed version of System 7.5.3. After installing System 7.5 Update 2.0, you should then install System 7.5.5 Update.

Alternatively, you can purchase and install System 7.5 Version 7.5.3 which includes the updates and fixes found in System 7.5 Update 2.0 and System 7.5.3 Revision 2. You can then install System 7.5.5 Update.

- 2) Question: Do I then need to install System 7.5.3 Revision 2 as well?

Answer: Revision 2 is a set of six system software enhancements that improves the reliability and performance of some computers using System 7.5.2 (on PowerBook computers ONLY) and System 7.5.3. If you have one of the computers listed below, you should install System 7.5.3 Revision 2 AFTER installing System

7.5 Update 2.0. If your computer is not listed, you can still install System 7.5.3 Revision 2, but it will not provide you with any benefits. System 7.5.3 Revision 2 does not need to be installed before installing System 7.5.5 Update because the fixes from Revision 2 are in System 7.5.5 Update.

- All PowerBook systems using Connectix RAM Doubler
- All PowerBook 5300 and PowerBook Duo 2300 systems
- All PowerBook 200 or 500 Series systems which have been upgraded with the Macintosh PowerBook Processor Card Upgrade Kit with PowerPC (or upgraded with similar third party products)
- All Macintosh 7200, 7500, 7600, 8500, and 9500 systems

3) Question: Can I skip installing System 7.5 Update 2.0 and just install System 7.5.5 Update?

Answer: No. System 7.5.3 (pre-installed), System 7.5 Update 2.0, and System 7.5.3 Revision 2 do NOT contain all of the same fixes. So, if your computer requires System 7.5.3 Revision 2, then you should first install System 7.5 Update 2.0, then install System 7.5.3 Revision 2, and then install System 7.5.5 Update.

Alternatively, you can purchase and install System 7.5 Version 7.5.3 which includes the updates and fixes found in System 7.5 Update 2.0 and System 7.5.3 Revision 2. You can then install System 7.5.5 Update.

4) Question: What is System 7.5 Version 7.5.3?

Answer: System 7.5 Version 7.5.3 contains all the updates and fixes for System 7.5 into one installer that can be used on any Macintosh computer that supports System 7.5. It contains the fixes from System 7.5 Update 1.0, System 7.5 Update 2.0, and System 7.5.3 Revision 2.

System 7.5 Version 7.5.3 is not available on the online services. It is a commercial product which is available from Apple authorized resellers.

The name Unity says it all. It unites all the various flavors of 7.5.3 into one installer that can be used to install on any Mac OS computer.

For additional information about the fixes included in System 7.5 Update 2.0 and System 7.5.3 Revision 2, use the following information to search for related articles in the Tech Info Library:

Mac System 7.5.3: About the Extensions folder Read Me (6/96)

=====
Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the About the Extensions Folder ReadMe for Macintosh System 7.5.3.

DISCUSSION -----

Macintosh System 7.5.3, What's Inside the Extensions Folder?

About this document

If you're curious about the contents of the Extensions folder, this document provides a brief description of each extension. You can use these descriptions to help determine which extensions you may need and which ones you may not need.

What is an extension?

An extension is a small file that changes how your computer operates. Unlike a control panel, you typically do not have any direct interaction with an extension. An extension makes the appropriate changes when you start your computer and remains active until you shut down your computer.

Depending on the type of computer you have, the contents of your Extensions folder may vary. You might have extensions that were added by third-party applications, and you don't need to have all the extensions described below. You can use the Extensions Manager control panel to turn off any extension you don't need.

9500 Guide Additions: Adds step-by-step instructions for using features specific to the Power Macintosh 9500 to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

A/ROSE: Allows communication between your computer's main logic board and NuBus cards that run the Apple Real-Time Operating System. Examples of such NuBus cards include the Apple Token Ring 4.16 NB card and the Apple Serial NB card.

About Apple Guide: Provides information about how to use Apple's onscreen help system. You can access About Apple Guide from the Guide (question mark) menu when the Finder is active.

AppleCD Audio Player Guide: Provides step-by-step instructions for using the AppleCD Audio Player. You can access the AppleCD Audio Player Guide from the Guide (question mark) menu, after you install and open AppleCD Audio Player.

Apple CD-ROM: Enables your computer to use an Apple CD-ROM drive.

Apple Color Printer: Enables your computer to print documents on an Apple Color Printer.

Apple Color SW Pro CMM: Contains color-matching information used by ColorSync 2.0 to maintain consistent color between documents.

Apple Guide: Adds Apple Guide functionality to your computer. Apple Guide is Apple's integrated onscreen help system.

Apple Photo Access: Part of the CD-ROM software for viewing Kodak PhotoCDs.

AppleScriptLib: Provides native support for AppleScript on PowerPC-based computers.

AppleScript: Enables automation of repetitive tasks in applications that support it.

AppleShare: Gives you access to shared disks on the network.

AppleTalk ImageWriter: Enables your computer to print documents on a networked ImageWriter II.

AppleVision Guide Additions: Adds step-by-step instructions to Macintosh Guide about how to use AppleVision displays with your computer. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Assistant Toolbox: This is the base extension for AutoRemounter. AutoRemounter works on Macintosh PowerBook computers and allows file synchronization, battery management, and easy mobile computing. It also provides support for a persistent RAM disk and deferred printing. This extension may conflict with the LaserWriter Select 310 printer software to block printing. A solution is to turn off background printing in the Chooser.

Audio CD Access: Lets you play audio CDs on your internal or external CD-ROM drive. Requires the AppleCD Audio Player or equivalent application to control the audio CD.

AV Guide Additions: Adds step-by-step instructions to Macintosh Guide about how

to use AV monitors with your computer. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

AV Setup: Used to control AppleVision displays.

Caps Lock: Provides a visual indication of the state of the Caps Lock key on a Macintosh PowerBook. When Caps Lock is turned on, an "up" arrow appears in the menu bar next to the Guide (question mark) menu. (Not needed on Macintosh PowerBook 500 series computers.)

Clipping Extension: Lets you use the drag-and-drop feature to create clipping files on your desktop.

Color Picker: Presents a standard interface for color selection. Applications can use this tool to let you choose colors.

Color SW 2000 Series CMM: Color-matching information used by ColorSync 2.0 to maintain consistent color between documents printed on a Color StyleWriter 2000 series printer and other color devices.

Color SW 2400: Enables your computer to print documents on a Color StyleWriter 2200 or Color StyleWriter 2400.

Color SW Pro: Enables your computer to print documents on a Color StyleWriter Pro.

ColorSync: Matches colors on your display with the closest matching colors on your printers, scanners, and other devices.

EM Extension: Works with the Extensions Manager control panel, which lets you specify which extensions are turned on when you start your computer.

Energy Saver Guide Additions: Adds step-by-step instructions for using Energy Saver to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Ethernet (Built-In): Used by Open Transport to allow access to the built-in Ethernet port on your computer.

EtherTalk Phase 2: Lets you connect your computer to an Ethernet network.

File Sharing Extension: Enables your computer to share files and folders with other computers on your network.

Find File Extension: Lets you search for files and view the results in a single window. If you turn off this extension and choose Find from the File menu, you'll get the System 7.1 Find dialog box instead of the Find File window.

Finder Help: Provides Balloon Help support for the Finder.

Finder Scripting Extension: Allows you to use AppleScript to automate tasks in the Finder.

Foreign File Access: Enables your computer to work with CD-ROM discs whose contents don't use the standard Mac OS file system (for example, ISO 9660 or High Sierra formats).

Graphics Accelerator: Provides video acceleration for the PCI video card.

High Sierra File Access: Part of the CD-ROM software that lets you view CDs with High Sierra file systems.

IIci/IIsi Monitors: Describes the capabilities of the built-in video card for the Macintosh IIci and IIsi. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

ImageWriter: Enables your computer to print documents on an ImageWriter or ImageWriter II connected to a serial port.

ImageWriter LQ: Enables your computer to print documents on an ImageWriter LQ connected to a serial port.

ISO 9660 File Access: Part of the CD-ROM software that lets you view CDs with ISO 9660 file systems.

LaserWriter: (version 7.2) Enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter 300: Enables your computer to print documents on a Personal LaserWriter 300, LaserWriter Select 300, or a Personal LaserWriter LS.

LaserWriter 8: (version 8.x) A PostScript level II print driver that enables your computer to print documents on a PostScript printer connected to an AppleTalk network.

LaserWriter IISC: Enables your computer to print documents on a LaserWriter IISC connected to a SCSI port. Replaced by Personal LaserWriter SC.

LW Select 310: Enables your computer to print documents on a LaserWriter Select 310.

MacinTalk Pro: Lets your computer read text documents in human-like voices. Older computers (with 68030 or 020 processors) should use MacinTalk 3 instead.

MacinTalk 3: Lets your computer read text documents in human-like voices. Used by MacinTalk version 3. Computers with 68040 or PowerPC processors should use MacinTalk Pro instead.

Macintosh Guide: Contains step-by-step instructions for working in the Finder. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

MacTCP Token Ring Extension: Enables you to connect to a Token Ring network using TCP/IP protocol.

Mailbox Extension: Supports your PowerTalk mailbox. Enables the Mailbox icon to appear on your desktop.

Monitors & Sound Guide Additions: Adds step-by-step instructions for using the Monitors & Sound control panel to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

My Speech Macros: Supports the Speech Macro Editor.

Network Extension: Lets you set Personal File Sharing from the Finder.

Network Guide Additions: Adds step-by-step instructions for using your computer's network to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

ObjectSupportLib: A library developers use to support AppleScript on PowerPC-based computers.

Open Transport Guide Additions: Adds step-by-step instructions for using Open Transport to Macintosh Guide. You access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Open Tpt AppleTalk Library: Used by Open Transport for the AppleTalk communication protocol.

Open Tpt Internet Library: Used by Open Transport for the TCP/IP communication protocol.

Open Transport Library: Used by Open Transport.

OpenTptAppleTalkLib: Used by Open Transport for AppleTalk communication protocol.

OpenTptInternetLib: Used by Open Transport. for the TCP/IP communication protocol.

OpenTransportLib: Used by Open Transport.

PB 500 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 500 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 190 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 190 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 2300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 2300 to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PB 5300 Upgrade Guide Additions: Adds step-by-step instructions for using features specific to the PowerBook 5300 to Macintosh Guide. You can access

Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Personal LaserWriter SC: Enables your computer to print documents on a Personal LaserWriter SC or a LaserWriter IISC.

Portable StyleWriter: Enables your computer to print documents on a Portable StyleWriter.

PowerBook Guide Additions: Adds PowerBook-specific topics to Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

PowerBook Monitors Extension: Describes the PowerBook built-in display. If you remove this file, your computer can still use the PowerBook video card and you can still select the number of colors your screen can display, but certain options (such as gamma settings) may not be available.

PowerPC Monitors Extension: Supports the AudioVision 14 monitor.

PowerTalk Extension: Supports PowerTalk services. Includes information used by the PowerTalk key chain.

PowerTalk Guide: Provides step-by-step instructions for using PowerTalk. You can access the PowerTalk Guide from the Guide (question mark) menu, after you install PowerTalk.

PowerTalk Manager: Manages your PowerTalk mailbox and services.

Printer Descriptions: Contains descriptions for all printers that use the LaserWriter 8 printer software.

Printer Share: Provides the ability to share non-network printers (for example, the StyleWriter II) across a network.

PrintMonitor: Controls the printing process when background printing is activated.

Quadra AV Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Centris AV computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

Quadra Monitors Extension: Describes the capabilities of the built-in video card for the Macintosh Quadra and Macintosh Centris computers. If you remove this file, your computer can still use the video card and you can still select the number of colors displayed on your monitor, but monitor options (such as gamma settings) may not be available.

QuickTime: Provides built-in multimedia support for applications.

QuickTime PowerPlug: Provides native support of QuickTime for PowerPC-based computers when used in combination with QuickTime 2.0. This extension must be

used in addition to QuickTime 2.0.

QuickTime Musical Instruments: Supports 30 Roland Standard MIDI sound samples that can be accessed by QuickTime applications with no additional MIDI equipment.

Scripting Additions: Extends the AppleScript language with special features, such as finding the date or time of day. With scripting additions installed, AppleScript acts as if these features are part of the language. Scripting additions are required only when a script uses them.

Serial (Built-In): Used by Open Transport to allow access to the built-in serial port on your computer.

Shared Library Manager: Provides native support for Open Transport.

Shortcuts: Explains common keyboard equivalents and other shortcuts to use in the Finder. You can access Shortcuts in the Guide (question mark) menu when the Finder is active.

SimpleText Guide: Provides step-by-step instructions for using SimpleText. You can access the SimpleText Guide from the Guide (question mark) menu, after you open SimpleText.

Speech Guide Additions: Adds step-by-step instructions for using speech recognition to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Speech Recognition: Provides support for speech recognition.

SR Monitor: Used to monitor and interpret speech.

Startup Tuner: Ensures correctly starting up from the disk selected in the Startup Disk control panel.

StyleWriter II: Enables your computer to print documents on a StyleWriter II. Replaced by StyleWriter 1200.

StyleWriter 1200: Enables your computer to print documents on a StyleWriter, StyleWriter II, or StyleWriter 1200.

SystemAV: Used for audio-video input.

System Speech Rules: Supports voices and speech dialects.

TokenTalk Phase 2: Used by the Apple Token Ring card.

TokenTalk Prep: Supports TokenTalk Phase II.

Tutorial Items: Provides instructions for learning basic skills on your computer. You can access the tutorial from the Guide (question mark) menu when the Finder is active.

Video Guide Additions: Adds step-by-step instructions for using video to the onscreen help provided in Macintosh Guide. You can access Macintosh Guide from the Guide (question mark) menu when the Finder is active.

Video Startup: Used by the Apple Video Player.

WorldScript Power Adapter: Supports language kit software on PowerPC-based computers.

Macintosh System 7.5.3: About the System Folder Read Me (6/96)

Article Created: 20 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the About the System Folder ReadMe folder for Macintosh System 7.5.3.

DISCUSSION -----

Macintosh System 7.5.3, What's Inside the System Folder?

About this document

If you're curious about the contents of the System Folder, this document provides a brief description of what's inside.

Depending on the type of computer you have, the contents of the System Folder may vary. You might have items that were added by third-party applications, and you don't need all the items described below.

Finder: Displays the desktop area, where you work with files and disks, and keeps track of your files.

Apple Menu Items folder: When you place an item (folder, application, or document) in this folder, it appears in the Apple () menu. To create submenus, you can place folders inside of folders.

Clipboard: Temporarily stores the last item you cut or copied from a document.

Control Panels folder: Contains individual control panels. You use control panels to adjust your computer's settings. See the "About the Control Panels" document in the Apple Extras folder for more information.

Control Strip Modules folder: Contains modules used by the Control Strip. The Control Strip works on Macintosh PowerBooks and Mac OS-based computers that

support AppleVision displays.

Extensions folder: Contains individual extensions that modify the operation of your computer. Unlike a control panel, an extension works automatically, without your intervention. See the "About the Extensions Folder" document in the Apple Extras folder for more information.

Fonts folder: Contains font suitcases or individual font files. You can place up to 128 suitcase or font files in this folder. PostScript fonts are not included in the 128 file limit. Font suitcases can hold any number of font files, up to a limit of 16 MB.

Launcher Items folder: Contains files, folders, and applications that appear in the Launcher window.

Macsbug: A debugger used by programmers to help diagnose problems with programs, extensions, and so on. Unless you're programming, you don't need Macsbug.

Note Pad: Stores text placed on the Note Pad. (The Note Pad is available in the Apple menu.)

Preferences folder: Contains preferences files created by individual applications. A preference file determines application settings.

PrintMonitor Documents folder: Contains printer files of documents waiting to be printed (if background printing is on in the Chooser).

Scrapbook: Stores items placed in the Scrapbook. (The Scrapbook is available in the Apple menu.)

Shutdown Items folder: Contains applications or scripts that run automatically when you shut down your computer. You can add or remove items from this folder.

Startup Items folder: Contains applications or scripts that run automatically when you start your computer. You can add or remove items from this folder.

System file: Contains some system-wide resources, such as sounds and keyboard layouts.

Universal Enabler: Provides additional system software for your computer.

LaserWriter 8.4: Overview of Features & Benefits (8/96)

Revised: 8/8/96
Security: Everyone

LaserWriter 8.4: Overview of Features & Benefits (8/96)

=====

Article Created: 20 June 1996
Article Reviewed/Updated: 08 August 1996

TOPIC -----

This article contains an overview of the LaserWriter 8.4 software.

DISCUSSION -----

The LaserWriter 8.4 printer software ships with the LaserWriter 12/640 PS printer. This a new more powerful version of the LaserWriter driver the Mac OS.

Features
=====

- PowerPC Native.
- Improved Performance
- Single Pass Printing
- Improved User Interface
- Backward Compatible

PowerPC Native

The LaserWriter 8.4 driver is PowerPC native, allowing Power Macintosh users full benefit of the PowerPC processor.

The LaserWriter 8.4 driver also operates on 68xxx-based Macintosh computers.

Improved Performance

In tests performed by Apple on a Power Macintosh computer printing to a LaserWriter 12/640 PS, we have seen improvements in speed using LaserWriter 8.4 over previous versions of the LaserWriter driver. Using the new foreground

printing feature further increases performance compared to background printing. Tests were performed by Apple using mainstream applications and printing medium to high complexity documents.

Note:

If you are using Adobe PageMaker 6.0.1 and are printing to the Apple Color LaserWriter 12/600 PS, you may experience slower printing with LaserWriter 8.4. If this happens, Apple recommends using LaserWriter driver v8.3.4.

Single Pass Printing

With previous versions of LaserWriter software, when you printed a document, the print driver first created a spool file on the hard disk and the file was then parsed out to the printer incrementally. With single pass printing, print jobs are now sent directly to the printer, and no spool file is created on your hard disk.

This feature is very important to the graphic arts and publishing industries where a fast time to first page is very important, and their applications commonly create large spool files. Some of these spool files are larger than the remaining storage capacity of their hard disk. Single pass printing is available by selecting Foreground Printing in the Print dialog. Since Foreground printing does not create spool files, running out of disk space is no longer an issue.

Improved User Interface

The LaserWriter 8.4 provides a new and improved user interface for the print and page setup dialogs. This makes it easier to select desktop printers, and format the page for printing. When using Desktop Printing 2.0 (installed with LaserWriter 8.4), the desktop printer icons can be moved anywhere on the hard disk, and can be selected from the menu bar or control strip, as well as from the Print dialog.

Backward Compatible

All Apple LaserWriter printers--from the original LaserWriter to the Color LaserWriter 12/600 PS are supported using the LaserWriter 8.4 printing software.

Macintosh System Requirements

=====

- Apple Macintosh or Power Macintosh computer with 8MB of RAM.
- Hard Drive with at least 5MB of free space (for printer software and fonts)
- System Software 7.1 or later

This article was published in the 21 June 1996 issue of the Information Alley.

LaserWriter 12/640 PS: Acceptable Paper Sizes & Weights (6/96)

Revised: 6/25/96
Security: Everyone

LaserWriter 12/640 PS: Acceptable Paper Sizes & Weights (6/96)

Article Created: 21 June 1996

TOPIC -----

What paper sizes and weights can I use in the LaserWriter 12/640 PS?

DISCUSSION -----

The LaserWriter 12/640 supports US Letter, A4, B5, Executive and US Legal sized paper in the standard (250 sheet) cassette. The multipurpose tray can hold 80 sheets of standard US Letter paper and other paper sizes from postcard to US Legal. An optional 500 sheet cassette is available that supports US Letter, A4, and US Legal. An envelope cassette that can automatically feed up to 50 envelopes is also available.

The LaserWriter 12/640 PS supports 16 to 28 pound laser quality bond (60-90g/m²) in the paper cassettes and up to 50 pound (190g/m²) stock when fed manually through the multipurpose tray and exited through the face-up output tray. This printer also accepts most textured and colored stock, medium-weight photocopier transparencies, and laser labels. Envelopes can be printed from the multipurpose tray or from the optional envelope cassette.

The paper you use should not scorch, melt, transfer material, or release hazardous emissions when heated to 200 C (393F) for 0.1 seconds.

Begin_Table

Paper Type	Size
-----	----
US Letter	8 1/2 x 11" (215.9 x 279.4 mm)
US Letter Small	8 1/2 x 11" (215.9 x 279.4 mm)
US Legal	8 1/2 x 14" (215.9 x 355.6 mm)
US Legal Small	8 1/2 x 14" (215.9 x 355.6 mm)
A4	8.27 x 11.69" (210 x 297 mm)
A4 Small	8.27 x 11.69" (210 x 297 mm)
A5	5.84 x 8.26" (148 x 210 mm)

Executive	7 1/4 x 10 1/2 (184.2 x 266.7 mm)
B5	7.17 x 10 1/2" (182 x 257 mm)

Envelope sizes and weights:

Envelope	Weight	Size
-----	-----	-----
Comm 10	24 lb	4 1/8 x 9 1/2" (104.7 x 241.3 mm)
Monarch	24 lb	3 7/8 x 7 1/2" (98.4 x 190.5 mm)
EuroPostcard	50lb	4.13 x 5.83" (105 x 148 mm)
DL	80g/m^2	110 x 220 mm
C5	90g/m^2	162 x 229 mm

System 7.5, Version 7.5.3: Open Transport 1.1 Read Me (6/96)

Revised: 6/28/96
Security: Everyone

System 7.5, Version 7.5.3: Open Transport 1.1 Read Me (6/96)

Article Created: 21 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This article is the Open Transport 1.1 Read Me with System 7.5, Version 7.5.3.

DISCUSSION -----

Open Transport 1.1 Read Me

Introduction

This Read Me document contains late-breaking information about Open Transport compatibility, add-on software, and solutions to known problems with third-party software. For instructions about how to use the Open Transport control panels (AppleTalk and TCP/IP), use Macintosh Guide, available from the Guide (question mark) menu. For technical information about Open Transport, see "Open Transport Technical Info."

Network Software Selector

The Network Software Selector (NSS) enables users of most 68030, 68040, and early PowerPC-based computers to choose between Open Transport networking software and classic AppleTalk if both are installed. (You must restart the computer for the change to take effect.) PCI-based computers support only Open Transport. NSS is in the Apple Extras folder; information on using it is built into the application.

NSS is intended to ease the transition to Open Transport by allowing you to use the older networking software if there is a compatibility problem with an application and Open Transport. Once the problem is resolved, you should switch back to Open Transport.

NOTE: Because MacTCP is incompatible with Open Transport v.1.1, MacTCP is disabled any time Open Transport is selected using the Network Software

Selector. (Open Transport uses the TCP/IP control panel instead of MacTCP.) If, however, you reselect classic AppleTalk, MacTCP will be enabled again, but you will need to re-enter the IP settings in the MacTCP control panel.

- For users of the older networking software, this update includes MacTCP 2.0.6, which
 - shortens retransmission delays
 - prevents potential out-of-memory errors
 - makes configuring communications easier
 - gives users more control over which servers to contact and in what order

Network Interface Options

Open Transport 1.1 supports PCI bus, NuBus, communications slot, and PC-card network interface cards as well as built-in LocalTalk and ethernet network adapters. For Macintosh models without expansion options, Open Transport supports SCSI-attached network adapters.

Third party network interface options available for Open Transport include fast ethernet, ATM, and FDDI.

Compatibility

Open Transport is compatible with:

- existing applications that use AppleTalk as specified by Apple Computer, Inc.
- existing applications that use MacTCP as specified by Apple Computer, Inc.
- existing devices (such as printers) that you select in the Chooser
- existing NuBus network interface cards

Open Transport is compatible with existing AppleTalk, TCP/IP LocalTalk and ethernet networks. Macintosh computers running Open Transport can be added to an existing network without upgrading other computers on the network.

Dial-up Network Connectivity

For connectivity to AppleTalk networks, Open Transport supports Apple Remote Access version 2.0.1 or later.

For dial-up connectivity to TCP/IP networks, including the Internet, Open Transport supports third party MacTCP software extensions known as Link Access Modules, or "mdevs." Serial Line Interface Protocol (SLIP) and Point to Point Protocol (PPP) connectivity are provided through mdevs.

With the appropriate mdev installed, you use either SLIP (Serial Line Interface Protocol) or PPP (Point to Point Protocol) to connect to Internet Service Providers and other dial-up IP-access points. However, not all versions of all mdevs are supported by Open Transport 1.1. For best results, be sure to use the versions of software recommended below.

Open Transport 1.1 recognizes the following MacTCP mdevs. When installed on your system, they are available in the "Connect Via:" pop-up menu in the TCP/IP

control panel:

- FreePPP - version 1.0.4 or later
- MacPPP - version 2.1.4 SD or later (version 2.2.0 is not recommended).
- InterPPP - version 1.2.9 or later
- InterPPP II - version 1.1 or later
- InterSLIP - version 1.0.1 or later
- MacSLIP - version 3.0.2 or later
- VersaTerm SLIP - version 1.1.4 or later
- Sonic PPP - version 1.0.2 or later
- AOL Link - the most current version is recommended

In addition, there are a number of third party PPP mdevs (including Pacer PPP, FCR PPP and Tribe PPP) which have a common technology base and as a result are indistinguishable from one another to Open Transport. When installed, these appear in the "Connect Via:" pop-up menu in the TCP/IP control panel as "TCP/IP PPP."

NFS/Share 1.3.x and 1.4 are not compatible with Open Transport. To use NFS/Share with Open Transport, you must contact Intercon to obtain a version of NFS/Share that is compatible with Open Transport.

For more information on Open Transport compatibility, contact the developer of the software you want to use.

Obtaining Connectivity Software

FreePPP is shareware and can be found on a variety of Internet sites; typically at "info-mac" mirror sites in the comm/tcp/conn directory. A list of info-mac mirror sites can currently be found at:

<http://www.mcp.com/hayden/iskm/info-mac-mirrors.html>

Some sites where FreePPP can be found currently include:

<ftp://mirrors.aol.com/pub/info-mac/comm/tcp/conn/>

<ftp://mirror.apple.com/mirrors/Info-Mac.Archive/comm/tcp/conn/>

MacPPP version 2.1.4 is available as a part of the Apple Internet Connection Kit. For fax information in the US, contact Apple Computer Inc., at 800-462-4396. To locate an Apple reseller near you in the US, call 800-538-9696.

InterPPP, InterPPP II, and NFS/Share are commercial software products. For availability and ordering information in the US, contact InterCon Systems at 800-468-7266 or 703-709-5500.

MacSLIP is commercial software developed by Hyde Park Software. For availability and ordering information in the US, contact TriSoft at 800-531-5170 or 512-472-0744.

VersaTerm SLIP is commercial software developed by Synergy Software. For availability and ordering information in the US, contact Synergy at 610-779-0522.

SonicPPP is commercial software developed by Sonic Systems, Inc. For

availability and ordering information in the US, contact Sonic Systems at 408-736-1900 (voice) 408-736-7228 (fax).

MacPPP and FreePPP

If you experience problems using MacPPP or FreePPP when Virtual Memory is turned on, try turning off Virtual Memory. To find out how to turn off Virtual Memory, see the topic "How do I use hard disk space as memory" in Macintosh Guide, available from the Guide (question mark) menu.

PowerBooks that are updated with the PowerPC Upgrade Card

If you have a PowerBook that is upgraded with the PowerPC Upgrade Card, the AutoRemounter control panel may not work when you are using Open Transport. If you select "After Sleep" instead of "Always" in the AutoRemounter control panel, your computer will reconnect to shared volumes when you wake the PowerBook. It may take approximately 20 seconds to remount the shared volumes.

Introduction

Apple Open Transport is the modern networking and communications subsystem for the Mac OS. It is based on industry standards and brings a new level of networking connectivity, control, and compatibility to MacOS systems, while preserving and enhancing the hallmark of the Macintosh and Mac OS built-in support for easy-to-use networking.

Open Transport is designed to make it easier and more cost-effective to develop Macintosh-based applications for a wide variety of customers and markets. With Open Transport, Mac OS has built-in networking and communications based on cross-platform industry standards including the POSIX compliant X/Open Transport Interface (XTI), UNIX STREAMS and Data Link Provider Interface (DLPI).

Applications written to support Open Transport can directly support a wide range of networking environments (serial, dial-up network, LAN, and WAN), and multiple protocols (AppleTalk, TCP/IP, serial, and others) from a common code base. This capability is sometimes referred to as transport independence.

Open Transport 1.1 includes AppleTalk and TCP/IP protocols, and developer access to serial communications. Apple and third parties are working to add support to Open Transport for Point to Point Protocol (PPP), NetWare (NCP/IPX), Windows 95 (SMB/TCP/NetBIOS), DECnet, LAT, and X.25. Some of these additional capabilities may be incorporated or bundled with future releases of Apple Open

Files Added by the Open Transport Installer

The Open Transport Installer adds the following Extension files to Mac OS System Folder:

Open Transport Library contains the Open Transport code resource for 680x0-based Macintosh systems.

Open Tpt AppleTalk Library contains the code resource for AppleTalk communication protocol for 680x0-based Macintosh systems and AppleTalk compatibility support.

Open Tpt Internet Library contains the code resource for TCP/IP communication protocol for 680x0-based Macintosh systems and MacTCP compatibility support.

OpenTransportLib contains the code resource for PowerPC-based Macintosh systems.

OpenTptAppleTalkLib contains the code resource for AppleTalk communication protocol for PowerPC-based Macintosh systems.

OpenTptInternetLib contains the code resource for TCP/IP communication protocol for PowerPC-based Macintosh systems.

Ethernet (Built-In) contains the code resource allowing access to a built-in Ethernet port.

Serial (Built-In) contains the code resource allowing access to built-in serial ports.

Open Transport Guide Additions is an Apple Guide database that adds Open Transport instructions to Macintosh Guide

Open Transport also installs the new AppleTalk and TCP/IP configuration utilities (control panels) into the Control Panels folder in the System Folder.

What's New in Open Transport

The new Open Transport/AppleTalk and Open Transport/TCP both have been implemented as Open Transport STREAMS modules and as native code on Power Macintosh computers. They support the new XTI APIs, and their shared libraries can be dynamically loaded and unloaded as needed.

Both protocols also support dynamic reconfiguration (changed settings without requiring reboot), and feature new configuration applications offering Basic, Advanced, and Administrator tools. The new configuration applications -- AppleTalk and TCP/IP -- replace the older control panel implementations -- Network, MacTCP, and AdminTCP. To enhance ease of use and backward compatibility, the new applications are stored in the Control Panels folder in the System Folder.

Static and Dynamic AppleTalk Address Allocation

Open Transport/AppleTalk includes support for assigned (manually administered) protocol addresses. This allows AppleTalk nodes to be managed using protocol address as a unique and stable identifier. It can also reduce some of the network traffic associated with AppleTalk's dynamic address assignment features (AARP).

Dynamic addressing continues to be available for those customers who prefer the automated address allocation.

Network managers who prefer to have the network infrastructure automatically assign unique protocol addresses can continue to rely on AppleTalk Address Resolution Protocol (AARP). Network managers who find advantages in having fixed and well-known protocol addresses for each end-node can implement manual addressing.

When manual addressing is selected it is necessary to allocate and assign the initial protocol addresses, which will subsequently be "locked". Some administrators may prefer to do this allocation based on a central numbering plan, creating individual configuration templates (recommended or required settings) for each user. Others may prefer to allow the network to determine the initial address configuration (i.e., use dynamic addressing once), and then lock the uniquely assigned addresses after initialization.

It is important that all nodes on each individual AppleTalk subnet (a given

cable segment assigned a unique network number or network number range) be administered consistently -- either all with dynamic addressing or all with pre-assigned static addresses. This avoids a potential conflict between a new dynamic node acquiring an address assigned to an off-line, manually-addressed node. Administrators can enforce the addressing policy for a subnet by locking the addressing mode in the "dynamic" or in the "manual" state. As an administrative precaution, however, Open Transport/AppleTalk does continue to check for the presence of duplicate protocol addresses on the LAN when static addressing is configured.

Use of Parameter RAM

Under the classic AppleTalk networking architecture, AppleTalk's ON/OFF state, the selected network interface, the previous network (protocol) address, and the previous AppleTalk zone name were saved in persistent memory (parameter RAM) for reuse at boot time. To ensure backward compatibility, this information is still stored and retrieved on systems using Open Transport/AppleTalk. However, there are some changes made with Open Transport to accommodate the expanded capabilities of multiple, saved configuration files, and required network settings.

- At boot time, Open Transport reads the current AppleTalk configuration file to determine if AppleTalk should be set to ON or OFF. This value will override the value saved in parameter RAM.
- If the network interface specified in the current AppleTalk configuration file is locked (it is a required setting) and if the specified port is not available or cannot be initialized, AppleTalk compatibility will not automatically switch the port back to LocalTalk. Instead, AppleTalk will remain OFF. The user will receive a dialog notification in the event this occurs.

Open Transport TCP/IP Features

With the broad adoption of TCP/IP -- and the tremendous excitement and visibility of the Internet -- Apple has made a significant investment in bringing a workstation-class implementation of TCP/IP protocols to Mac OS. As with MacTCP, Open Transport/TCP is a full 32-bit stack. Open Transport/TCP adds support for:

- dynamic path MTU discovery, for more efficient network use in heterogeneous network topologies;
- Dynamic Host Configuration Protocol (DHCP), for centralized IP address configuration management. DHCP is an Internet Engineering Task Force (IETF) standards-track protocol;
- IP multicast, for participation as an MBone client;
- simultaneous TCP connections limited only by installed memory and processor power, for increased functionality as a Internet or other TCP/IP network server;
- a new, more robust and standards-compliant domain name resolver (a caching stub DNR);
- support for developer access to raw IP services, as well as TCP and UDP;
- Ethernet version 2 and IEEE 802.3 framing, for better interoperability with a wider range of TCP/IP hosts;

- implicit and explicit domain name search paths, for increased control of domain name resolution; and,
- multiple IP routers with fail-over, for increased robustness in mission critical applications.

DHCP Server Support

Apple's implementation conforms to the current versions of the applicable specification documents (RFCs). To date, Open Transport/TCP has been tested with the following DHCP server implementations:

- Competitive Automation,
- FTP Software (<http://www.ftp.com>),
- Hewlett Packard HP-UX (<http://www.hp.com>),
- Microsoft Windows NT Advanced Server,
- Silicon Graphics (<http://www.sgi.com>),
- Sun Solaris and SunOS (<http://www.sun.com>), and
- TGV (<http://www.tgv.com>).

DHCP Address Lease Support

Open Transport/TCP fully supports DHCP address leases. Open Transport/TCP will automatically attempt to renew any address lease that reaches its Renewal Interval, which defaults to half of the lease's lifetime. The Renewal Interval may be configured to a different value by making changes to the configuring DHCP server. Renewal will be attempted regardless of how many times the lease has already been renewed. Should an interface's IP address lease expire, the interface will be closed down.

Windows NT Advanced Server Support

With Open Transport 1.1, Mac OS clients are fully interoperable with the Windows NTAS DHCP server.

Macintosh clients running earlier versions of Open Transport (1.0.x) could experience some interoperability problems due to significant differences between the Microsoft implementation and that of a typical UNIX-based server.

Local HOSTS File Support

Open Transport/TCP supports a HOSTS file, stored in the System Preferences folder, that may be used to supplement and/or customize the Domain Name Resolver's initial cache of information. This file is parsed when Open Transport/TCP is initialized. As in MacTCP, the supported HOSTS file features follow a subset of the Domain Name System Master File Format (RFC 1035).

Should a HOSTS file be used, every effort should be made to keep it as small as possible, and to only include entries that will be accessed frequently. This reduces the total memory footprint required to cache the DNS information and minimizes the need to maintain and update the HOSTS files as system information changes over time.

In order to activate a HOSTS file, Open Transport/TCP must be configured using either the Advanced or Administrator mode to select the appropriate file. The

text file must already exist, and can be created with any text editor or word processor. Also note that the HOSTS file selection is tied to the selected configuration. An administrator might, for example, specify different HOSTS files for use when a user connects via Ethernet on the campus LAN and that same user when dialing-in from a remote location.

Human Interface Design

The Open Transport/TCP configuration application represents a complete overhaul of the human interface from the MacTCP software it replaces. In addition to generic new features noted elsewhere (multiple saved configurations, recommended and required settings, on-line documentation, etc.), key new features include:

- direct entry of IP addresses and subnet mask in standard "dot notation";
- explicit selection of desired configuration method, now including Manual, RARP, BootP, MacIP, and DHCP;
- support for attachment to networks using Classless InterDomain Routing (CIDR);
- support for multiple entries in the router, name server, and explicit domain search lists; and
- improved support for large AppleTalk networks when using MacIP server/gateways.

MacTCP "Server" Addressing Support

MacTCP Server mode addressing is a combination of the Bootstrap Protocol (BootP) and Reverse Address Resolution Protocol (RARP) configuration methods. When Server mode is selected, MacTCP uses BootP to attempt to acquire an IP address. If BootP fails to provide a valid address, MacTCP tries RARP. Whichever protocol is successful is stored as a preference, and is used first on next system startup. While this "fall-back" approach adds a degree of robustness from the user's point of view, it also adds a degree of unpredictability from a network administrator's point of view.

Based on customer feedback, Open Transport/TCP allows a network administrator to explicitly specify the single method they prefer to use. Thus while both RARP and BootP are supported, the Server mode does not appear as a choice in the Open Transport/TCP configuration utility.

MacTCP "Dynamic" Addressing

Open Transport 1.1 does not support MacTCP "Dynamic" addressing. MacTCP "Dynamic" mode addressing was based on an Apple-proprietary extension to TCP/IP protocols. It applied the address negotiation and assignment rules used by the AppleTalk protocols to TCP/IP networks, making it very easy to set-up a Macintosh-only standalone TCP/IP network. Use of this Dynamic Addressing method in other scenarios, however, could create additional work for a network administrator.

The Internet community (the IETF) has since developed a multivendor standard for the dynamic assignment of IP addresses, known as Dynamic Host Configuration Protocol (DHCP). Apple has adopted the industry standard DHCP and dropped support for the earlier "dynamic" mode addressing with Open Transport/TCP.

MacIP Support

MacIP, sometimes also referred to as KIP (Kinetics Internet Protocol), is a protocol specification developed as a method for carrying TCP/IP traffic on AppleTalk-only networks -- originally LocalTalk networks. MacIP is today frequently used with AppleTalk Remote Access Protocol (ARAP) to provide mobile users access to TCP/IP network services. MacIP specifies encapsulation of TCP/IP datagrams in AppleTalk packets for transmission over such connections.

Use of MacIP requires a gateway. AppleTalk encapsulated IP packets are sent to the MacIP gateway using AppleTalk protocols (DDP). The gateway strips off the AppleTalk encapsulation and places the IP packet on the TCP/IP LAN. When packets are destined for the MacIP end-node, that gateway provides the needed encapsulation services.

MacIP gateway support is most frequently offered as an integrated service within a multiprotocol router. The gateway (router) attaches to both an AppleTalk and a TCP/IP network, acting as a middleman between the MacIP end-node and the appropriate TCP/IP-based hosts on the LAN or WAN.

Open Transport includes end-node support for MacIP. A end-node is configured to use MacIP using the TCP/IP configuration utility by selecting "AppleTalk (MacIP)" in the "Connect via:" pop-up menu. The user (or network administrator) must also specify where on the network (in which zone) to look for the MacIP gateway. Once selected, TCP/IP will be encapsulated in AppleTalk and will be sent out the "Connect via:" interface selected using the AppleTalk configuration utility.

Open Transport/TCP includes a new human interface for selecting the MacIP server which offers the following new features:

- AppleTalk zones are now displayed in a true scrolling list in a movable window. This display is easier to view compared to MacTCP's pop-up menu when there are a large number of zones in the network.
 - The Zone list window now supports selection using the mouse, the arrow keys, and/or "type-select", allowing the user to more quickly select a specific zone from the list.
 - There is an option to display only those AppleTalk zones containing MacIP servers. When selected, this creates a background search task which when completed filters the zone list display to show only those zones containing active MacIP servers.
 - There is a short cut "Current Zone" option which causes the Mac to check the current AppleTalk zone for a MacIP server without requiring the user to select a specific zone. This can be a time-saver for the user and a potential bandwidth-saver on the network, especially when there are mobile users that connect in different locations to a enterprise-wide network for MacIP services.
- Network Interface Options

PPP Connectivity

PPP (Point to Point Protocol) connectivity is not bundled with Open Transport at this time. AppleTalk and TCP/IP connectivity over Open Transport/PPP is planned

to first be offered as a feature of upcoming Apple Remote Access products. ARA products would include necessary Open Transport components.

Apple currently plans to fully merge ARA client and personal server capabilities with basic Open Transport capabilities to offer an integrated communications package for LANs, WANs, and remote networking. These integrated capabilities are also expected to be delivered as a part of a future update to Mac OS. This timetable has not been finalized; details will be announced at a later date.

Application Compatibility with Open Transport

Apple has defined three levels of interoperability with Open Transport. The first -- known as Open Transport Compatible -- is used to describe a network application originally developed for "classic" AppleTalk or MacTCP, that now takes advantage of Open Transport Compatibility Services. These applications automatically gain the benefits associated with the new Open Transport configuration utilities. However, they will not realize a significant performance increase on Power Macintosh systems, nor can they take advantage of Open Transport's transport-independence capabilities.

Open Transport Ready applications are those that have been modified to adopt the new Open Transport APIs (XTI). They are PowerPC native, in addition to running on 680x0-based Macintosh systems. Open Transport Ready applications not only benefit from the new configuration utilities, but have the opportunity for a significant performance boost when running on Power Macintosh.

The third (highest) category of interoperability is referred to as Open Transport Enhanced. In addition to adopting the new Open Transport APIs and being Power PC native, these applications have been modified to exploit the transport-independent capabilities of Open Transport, i.e., they can be dynamically configured to support AppleTalk, TCP/IP, or serial communications.

Backward Compatibility

Applications that rely on undocumented APIs or examine private data structures in current the AppleTalk or MacTCP may not be fully compatible with Open Transport. Examples include the MacSNMP AppleTalk and TCP/IP Agents (however, MacSNMP and the Macintosh System Agent are compatible), the Apple Internet Router 3.x and some utilities like MacTCP Watcher and MacTCP Spy. Updated versions of these software products will be required for full compatibility.

Performance

Open Transport is written to take advantage of the PowerPC processor -- it is native code. This provides the necessary foundation for increased networking performance in Mac OS. To realize performance gains, however, it is equally important that networking applications also be accelerated for Power Macintosh, and that applications adopt the new Open Transport XTI-based programming interfaces.

The built-in "backward compatibility" support for existing AppleTalk and TCP/IP applications must continue to run as 680x0 code in emulation on Power Macintosh. This protects a customer's investment in networking applications, but also

obscures underlying performance increases from the native protocol implementations.

In general, current Mac OS networking applications are written for the 680x0 processor, and use the "classic" (68K-based) networking programming interfaces. These applications are not likely to see performance boosts with Open Transport, as most of the performance potential is based on the move to native code for the PowerPC processor. Even for Power Macintosh native applications, a continued use of the Open Transport backward compatibility libraries offsets most of the performance gains in the low level protocol handling.

Users who select Power Macintosh native applications that are Open Transport-ready will realize the greatest performance gains. Performance of specific network applications may also be significantly influenced by the processor speed of the system. Customers with demanding, network I/O intensive applications should give strong consideration to the higher performance PowerPC-based Macintosh systems.

However, even with 68K emulated applications using backward compatibility, TCP/IP users are more likely to see some performance improvements with Open Transport. This is because of the differences in the way compatibility is provided for MacTCP vs. AppleTalk, and differences in the two protocol architectures.

Performance will be greater with protocols that use larger datagram sizes -- such as TCP/IP -- than with AppleTalk (which has a fixed and limited datagram size). On high-speed datalinks such as fast Ethernet, FDDI, and ATM, the performance of the network interface card (NIC) driver code is also a significant factor. Comparative shopping for NICs -- based on price, service, reliability, and performance -- will be in order.

Open Transport running on the built-in Ethernet of the Power Macintosh 9500 has been clocked at 9.3 Mbps throughput using low-level TCP/IP benchmarks. A pre-release version of a third party Open Transport-native implementation of 'NFS' protocols was benchmarked at 8.4 Mbps. Both figures approach theoretical maximum performance for 10 Mbps Ethernet. AppleTalk performance is somewhat lower, with low-level benchmarking coming in at a bit over 7.5 Mbps throughput.

The Open Transport engineering team is continuing to work with NIC developers to realize high-performance DLPI drivers for high-speed datalinks. This is a cooperative effort, with work being done on both driver code and on Open Transport. We expect that high-speed datalink NIC drivers based on Open Transport 1.1 can be fully competitive with other PCI networking products. Of course, performance tuning will be an ongoing priority, as Apple intends to always offer a platform capable of industry leading network performance.

Benchmarking on these types of datalinks, with pre-release Open Transport 1.1, has been underway for some time. Some sample results include:

- 48 Mbps with a Rockwell fast Ethernet card and driver (1500 byte block size)
- 72 Mbps with a Rockwell FDDI card and driver (4K block size)
- 93 Mbps with an Interphase ATM-155 card and driver (8K block size)

These tests were performed using Open Transport/TCP 1.1 beta software, running on a Power Macintosh 9500/132, and reflect memory to memory, point to point transfers (the "SpudPPC" test tool) on a dedicated test bed. In addition to these numbers, we've seen even higher throughput from Fore Systems on their ATM card, using UDP.

AppleTalk performance is expected to be lower than TCP/IP performance due to various technical issues, including DDP packet size and the ATP retry-acknowledgment algorithm. Current testing on fast Ethernet is turning in figures around 35-40 Mbps with a PowerPC native ATP test tool.

Large Datagram Support

Maximum allowable datagram size is dependent on both the selected datalink and the selected protocol stack. Open Transport supports the use of large datagram sizes as appropriate to the protocol and datalink in use.

Because Open Transport/AppleTalk is based on the Phase 2 architecture, datagram size for AppleTalk is limited to a maximum of 617 bytes. Open Transport/TCP supports larger datagrams; up to 1,500 bytes on Ethernet and fast Ethernet, and up to 16K on token ring. Even larger block sizes can be used on FDDI and ATM.

Block size does play a role in maximum throughput; the larger the block size used, the greater the potential end-to-end throughput. Users demanding the highest network throughput may find FDDI to be a more attractive alternative than fast Ethernet because it can support larger block sizes at the same bit rate.

CLW 12/600 PS: Windows Color Management Software (3/97)

Article Created: 21 June 1996
Article Reviewed/Updated: 24 June 1996

TOPIC -----

I am using the Apple Color LaserWriter 1200/600 PS printer with a Microsoft Windows 3.1 computer. When I print using RGB, blue prints a purple, red a magenta, and green a pea green color. Since Windows 3.1 does not include any color management software, is there any way to get the colors I see on my computer screen to match those of the Color LaserWriter printer?

DISCUSSION -----

Color management technology is just starting to become a mature and rich technology. Although this technology is more prevalent on the Macintosh platform because of its desktop publishing/graphics marketshare and ColorSync software, color management systems (CMSs) are making their way into the PC/Windows platform.

You may be able to find a very small handful of CMSs that work with Windows 3.1, though the industry is heading towards color management solutions using Windows 95 since it has a built-in CMS called ICM (Image Color Matching). ICM adopts the platform independent ICC (International Color Consortium) device profiles which the industry has accepted.

The basics of color management are to have an ICC profile of the input device (which characterizes the color range of that device), and an ICC profile of the output device (again which characterizes its own color range). The CMS then is responsible for "matching" as close as possible the two different ranges so that you get WYSIWYG color. Below is how the Macintosh CMS works.

Macintosh Color Management System

The Macintosh uses ColorSync as its CMS. All of the ICC profiles for Macintosh devices reside in the ColorSync Profiles folder. You select the appropriate

monitor the ColorSync Profile control panel, then select the appropriate output color device profile in the Print Options. For the Color LaserWriter 12/600 PS printer or Color LaserWriter 12/660 PS, you would select ColorSync Color Matching and the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS as your output device. ColorSync automatically performs color matching for you.

Microsoft Window CMS Options

=====

Since you are using Microsoft Windows, you should contact the vendors below to obtain additional information on their Color Management Systems for Windows. Some of these products are only available when you use Windows 95.

+=====+	
Vendor	Product/CMS
+=====+	
Adobe Systems, Inc.	PageMaker 6.0 (includes Kodak's Precision CMS)
+-----+	
Agfa Division,	FotoTune
Bayer Corporation	
+-----+	
Canon USA, Inc.	Calibration for CLCs (for Canon Color Laser Copiers.)
+-----+	
Microsoft Corp.	Windows 95 (includes Image Color Matching engine and ICC device profiles)
+-----+	
Pantone Inc.	ColorDrive 1.5
+-----+	

End_Table

This article also pertains to the Color LaserWriter 12/660 PS printer.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

This article appeared in the 21 June 1996 issue of the Information Alley.

Article Change History:

System 7.5, Version 7.5.3: About Desktop Printing (6/96)

=====

Article Created: 21 June 1996
Article Reviewed/Updated: 28 June 1996

TOPIC -----

This Article Is The About Desktop Printing Document With System 7.5, Version 7.5.3.

DISCUSSION -----

About Desktop Printing

Your New Software Comes With Desktop PrintMonitor Version 1.0.3. You Use Desktop PrintMonitor To Create Printer Icons (or "desktop Printers") On Your Macintosh Operating System (Mac OS) Desktop. You Can Print A Document By Simply Dragging It To A Desktop Printer Icon. Desktop Printers Also Give You More Control Over Printing, Including Setting Printing Priorities And Choosing Specific Times For Printing.

Creating Desktop Printers

You Create Desktop Printers By Selecting A Printer In The Chooser. A Desktop Printer Icon Appears On Your Desktop When You Close The Chooser.

You Can Drag This Icon To Any Position You Want On Your Desktop. You Cannot Move It Off The Desktop.

If You Want, You Can Select Other Printers In The Chooser And Create Other Desktop Printers For Easy Access. You Must Close The Chooser Each Time To Create A Desktop Printer.

The Last Desktop Printer Created Becomes The Default Printer. Your Documents Will Automatically Be Printed On The Default Printer.

Printing With Desktop Printers

You Can Print Documents Within Your Applications As You Normally Do. You Can

Also Print Documents Without Leaving The Finder, Using One Of The Two Methods Described Here. These Methods Are Particularly Efficient When You Have A Number Of Documents You Want To Print At Once.

- Drag The Icons Of The Documents You Want To Print To The Desktop Icon Of The Printer You Want To Use.
- Select The Icons Of The Documents You Want To Print And Choose The Print Command From The File Menu.

The Computer Will Show You The Print Dialog Box So You Can Choose Printing Options. Make Your Choices, Then Click The Print Button.

After A Few Moments, The Document Starts To Print. If Background Printing Is Turned On, You Can Continue Working While The Document Is Printing.

Selecting A Default Printer

If You Have More Than One Printer Available, You Can Select Which You Want To Use. The Printer You Select Is Called The "default Printer." All Your Documents Will Be Printed On The Default Printer Until You Select A New One.

To Change The Default Printer, Use One Of These Three Methods:

- Drag The Document You Want To Print To A Desktop Printer Icon, And It Will Automatically Become The Default Printer.
- Select The Desktop Printer Icon And Use The Printing Menu To Set The Printer As The Default.
- Select A New Printer Using The Chooser.

NOTE: Switching Between Printers May Change How Much Information You Can Fit On A Page. It's Best To Choose A Printer Before You Spend Much Time Formatting The Document.

Working With Desktop Printer Icons

Desktop Printer Icons Change To Indicate Printing Status:

- Plain icon indicates a printer that is not currently chosen for printing.
- Default icon indicates the printer you have currently chosen to print on.
- Printing icon indicates a document is printing on this printer.
- Stopped icon indicates you have stopped the print queue.
- Error icon indicates there is an error on this printer. double-click the icon to see a message.
- Disabled icon indicates this desktop printer is not available.

You Can Do The Following With Desktop Printer Icons:

- Throw Away The Icon. Drag The Icon To The Trash. You Can't Throw Away A Desktop Printer Icon While The Printer Is Printing A Document. (You Can Create Another Desktop Printer Icon For That Printer Whenever You Like.)

Note: You Must Always Have At Least One Printer Icon On Your Desktop. If You Throw Away The Last Icon, It Will Immediately Be Created Again.

- Rename The Icon. Rename The Icon As You Would Any Other Finder Icon. Click The Name To Highlight It, Then Type The New Name. This Changes The Name Of The Icon, Not The Name Of The Printer.

- Move The Icon. You May Drag The Icon Anywhere You Like On The Desktop. However, You May Not Move It Off The Desktop.

- Create An Alias For The Icon. You May Create An Alias For The Icon As You Would Any Finder Icon, By Selecting The Icon And Choosing The Make Alias Command From The File Menu. The Alias May Be Moved Anywhere On Or Off The Desktop.

Monitoring Printing

If You Are Using Background Printing, You Can Use The Desktop Printer Features To Monitor And Control The Documents That Are Waiting To Print. To Learn How To Turn Background Printing On And Off, See Your Printer Manual.

To Monitor The Printing Of Documents:

1) Double-click The Desktop Printer Icon You're Interested In.

A Window Opens Listing The Documents That Are Printing Or Waiting To Print.

Watching The Status Messages Can Be Helpful When Troubleshooting Printing Problems. When More Than One Job Is Waiting To Be Printed, A List Of Print Jobs Appears In The Waiting List, Showing The Order In Which They Will Be Printed (when Sorted By Print Time.)

2) Choose What You'd Like To Do.

- To Cancel A Print Request, Select It By Clicking Its Icon And Click The Remove Button.

You Can Only Select The Currently Printing Document By Clicking Its Icon. (You Can Select More Than One Item At A Time By Holding Down The Shift Key While Clicking.) You Can Also Drag The Icon For The Print Request To The Trash. Note That These Methods Delete Only The Print Request (also Referred To As A Spool File), Not The Document Itself.

- To Put A Print Request On Hold, Select It And Click The Hold Button.

The Print Request Will Stay On Hold Until You Select It Again And Click The Resume Button. You Can Also Put The Document That's Currently Printing On Hold By Dragging It To The List Of Documents Waiting To Print (lower Part Of The Window).

- To Indicate That A Print Request Is Urgent, Select It And Choose Set Print Time From The Printing Menu. In The Dialog Box That Opens, Click Urgent.

- To Indicate That A Print Request Should Not Print Until A Future Time, Select

It And Choose Set Print Time From The Printing Menu. In The Dialog Box That Opens, Click At Time, Then Set The Time You Want.

- To Change The Order Of The Items Waiting To Print, Move Their Place In The List By Dragging Their Titles Up Or Down In The List.
- To Sort The List Of Documents Waiting To Print, Click The Title Of The Column You Want To Sort By.

For Example, To Sort By The Name Of The Document, Click "Document Name." (You Can Also Sort By Choosing The Commands In The View Menu.) The Column Title You Sorted By Is Underlined. Sorting The Items Does Not Change The Order In Which They Will Print. To See That Order, Sort By Print Time.

- To Temporarily Stop All Documents From Printing On This Printer, Choose Stop Print Queue From The Printing Menu.

To Resume Using The Printer, Choose Start Print Queue From The Printing Menu. If The Desktop PrintMonitor Window Is Open, You Can Begin Printing The Document From The First Page By Option-clicking The Resume Button (holding Down The Option Key While Clicking The Resume Button).

Shortcut: The Printing Menu For Starting And Stopping The Print Queue Is Available Without Opening The Window For The Printer, As Long As The Printer's Icon Is Selected On The Desktop.

- To Move A Print Request From One Printer To Another Printer Of The Same Type (for Example, From A LaserWriter 4/600 PS To A LaserWriter 16/600 PS), Drag The Icon For The Print Request To The Icon Of The Printer Where You Want To Move It.

You Can Only Move A Print Request From A PostScript Printer To Another PostScript Printer. The Printing Software Won't Let You Move A Print Request To An Incompatible Printer. For Example, You Can't Move A Request From A LaserWriter Printer To A StyleWriter Printer.

Turning The Manual Feed Notification On Or Off

The Desktop PrintMonitor Is Set Up To Notify You About Manually Feeding Paper The Same Way Your PrintMonitor Was Set. For Example, If You Turned Off Notification For Manual Feeding In Your PrintMonitor, The Desktop PrintMonitor Will Also Have Manual Feed Notification Turned Off.

If You Want To Change How The Desktop PrintMonitor Notifies You About Manual Feeding, Follow This Procedure:

- 1) Hold Down The Shift Key And Restart Your Computer, Keeping The Shift Key Depressed Until The Message "Extensions Off" Or Your Normal Desktop Appears.
- 2) Open Your System Folder And Then Open Your Extensions Folder.
- 3) Double-click The PrintMonitor Application.

- 4) Choose Preferences From The File Menu.
- 5) Select Your Manual Feed Option And Click OK.
- 6) Close The PrintMonitor.
- 7) Restart Your Computer.

Turning Off Or Removing The Desktop Printing Software

----- Removing A Desktop Printer Icon

You Can Remove An Individual Desktop Printer Icon By Dragging It To The Trash. If You Have Only One Desktop Printer, You Can't Get Rid Of The Icon By Dragging It To The Trash. (The Icon Will Reappear If You Do.) To Get Rid Of The Desktop Printer, You Must First Select A Different Desktop Printer As The Default Printer And Then Drag The Desktop Printer Icon To The Trash. If You Don't Want To Use Desktop Printer Icons, See "Turning Off The Desktop PrintMonitor" Or "Removing Desktop Printing Software" For Information About How To Remove The Desktop Printer Software.

Turning Off The Desktop PrintMonitor

If You Don't Want To Use Desktop Printers, You Can Turn Off The Desktop PrintMonitor Using The Extensions Manager (available On Macintosh System 7.5, The Current Version Of The Mac OS).

To Turn Off The Desktop PrintMonitor:

- 1) Open The Extensions Manager Control Panel In The Control Panels Folder.
- 2) Click To Deselect (uncheck) The Desktop PrintMonitor, Desktop Printer Extension, And Desktop Printer Spooler Extensions In The Panel.
- 3) Click The Close Box To Close The Control Panel.
- 4) Restart Your Computer.

Removing The Desktop Printing Software

The Desktop Printing Software Uses Both The Desktop PrintMonitor And The PrintMonitor Software. The Desktop PrintMonitor Requires 200-400K Bytes More Free System Memory In Addition To The Memory Required By The PrintMonitor. If You Don't Want To Use The Desktop Printing Software, You Can Remove It.

To Remove Desktop Printing Software:

- 1) Restart Your Computer With The Extensions Off By Holding Down The Shift Key And Choosing Restart From The Special Menu. Hold The Shift Key Down Until The Message "Extensions Off" Appears Or Until Your Normal Desktop Appears.
- 2) Drag The Following Files From The Extensions Folder To The Trash:

Desktop PrintMonitor 1.0.3
Desktop Printer Spooler 1.0.3
Desktop Printer Extension 1.0.3

3) Restart Your Computer.

Using Save Or Open With Desktop Printers

When You Choose Save Or Open In Your Application Programs, You Will See Your Desktop Printers Listed As If They Were Folders, But You Should Not Save Or Open Any Documents In Them. If You Do, You Will Not Be Able To Access Your Documents.

Having More Than Five Desktop Printers

If You Want To Have More Than Five Or Six Desktop Printers, You Must Increase The Desktop PrintMonitor Memory Allocation By 12K For Each Additional Desktop Printer You Want. To Do So, Select Its Icon (it's In The Extensions Folder Inside The System Folder), Choose Get Info, Type A Larger Number In The Preferred Size Box, Then Close The Get Info Window.

About Creating Duplicate Desktop Printer Icons

If You Use Different Versions Of The LaserWriter 8 Software And Print Using The Desktop PrintMonitor, You May Create Duplicate Desktop Printer Icons For The Same Printer. For Example, Say You Use The LaserWriter 8.3 Driver For Printing And Also Use The LaserWriter 8.2.2f Driver For Faxing. If You Select Your Printer In The Chooser Using The LaserWriter 8.3 Driver, And Select It Later Using The LaserWriter 8.2.2f Driver, Two Desktop Printer Icons Will Appear For That Printer. To Avoid Creating Confusing Duplicate Printer Icons, Primarily Use One Version Of Your Printer Software Driver, Or Rename The Icons With Distinguishing Names.

TOPIC -----

This article is the System 7.5 Technical Details (part 1 of 3) document.

DISCUSSION -----

System 7.5 Technical Details (part 1 of 3)

This file is one of several Read Me files that describe technical details between system software 7.5 and system software 7.5.3. This information is most appropriate for advanced users. For less technical information, see the About System 7.5 document, the Installing System 7.5 document, or the What's New in version 7.5.3 document.

What's in this document (part 1 of 3)

- General information about system software version 7.5.3
- Changes to the Finder
- Changes to Find File
- Changes to Standard File
- Changes to control panels
- Changes to Apple Guide
- Changes to Apple Menu Options

General information about system software version 7.5.3

System software version 7.5.3 provides the enhancements introduced in System 7.5, System 7.5 Update 1.0, System 7.5 Update 2.0, and System 7.5, Revision 2.

This software installs the latest versions of all components it finds on the disk it is updating, including any components that you disabled using the Extensions Manager. After you run the Installer, the updated components will be in the same folders as they were before you installed the update. For example, new versions of disabled extensions will be in the Extensions (Disabled) folder,

and new versions of disabled control panels will be in the Control Panels (Disabled) folder.

The file called "System 7.5 Update" replaces the enabler on all computers capable of running system software versions 7.5 and/or 7.5.1. Computers that did not previously need an enabler to work with system software versions 7.5 and 7.5.1 still need the System 7.5 Update file since it contains most of the fixes delivered in this update.

The file called "System 7.5.2 Update" replaces the enabler file on all computers capable of running system software version 7.5.2.

If you use the Custom Install option to install a system for Any Macintosh, both updated enablers are installed. This is normal for the Any Macintosh option. Do not delete one or both of these enablers.

This update includes all of the fixes included with the previously released 7.5.2 Printing Update, the PowerBook 5300 System Software Update, and the PowerBook 2300c Update. You do not need these updates if you install this software. If you previously installed any of these updates, you should install this software, since it contains additional fixes.

After you install the update, the About This Macintosh window says "System Software 7.5.3." The window also says "Revision 2" to indicate the source of the system software.

Changes to the Finder

This software includes a new version of the Finder with the following changes:

- When you rebuild the desktop, comments typed in a file's Get Info window are no longer deleted. (Of course, if you delete the desktop database -- for example, by making it visible using a utility and then moving it to the Trash -- the comments will be lost because the Finder will have to build a new desktop at startup.)
- The Name field (used in Finder windows set to one of the list views) is wider, allowing you to see more characters in filenames.
- On PowerPC-based computers, icons are translucent while you drag them (rather than simply appearing as outlines). If you drag several icons at once, only the icon under the mouse will be translucent -- the others will still be outlines.
- Copying large numbers of small files is faster. (Previous versions of the Finder updated the bar in the copy progress dialog box approximately thirty times per second; the new version updates the copy progress bar far less frequently.)
- The Finder Update file (once named PowerPC Finder Update) is now part of the Finder. This update deletes all old versions of this file.
- When the Clipboard is active, the Clean Up Window command is dimmed. This eliminates a crashing bug in the Finder.

- The Finder flushes the processor's cache more intelligently, improving the Finder speed on all 68040- and PowerPC-based computers.
- Fixes a problem that caused an out-of-memory error when emptying the Trash if QuickDraw GX was installed.
- Fixes a problem that caused seemingly false out-of-memory messages when trying to open or close Finder windows. This problem sometimes occurred when the desktop had very few icons on it, a window with the Kind column was visible, and a large number of different kinds of documents had been displayed since the last restart.
- Fixes a problem introduced by the Finder that shipped with System 7.5 Update 1.0. The Find window of Find File will now be made active if Find File is already open and you choose Find from File menu (or Find File from the Apple menu).
- If use an alias to connect to a server and your server password has expired or needs to be changed, you'll see a message that the password needs to be changed. (Prior versions told the user that the server couldn't be found.)
- File copies are now done asynchronously, which makes the CPU more available to other applications during copying. If another application is made active during a file copy, the computer does not slow down as much. This effect is most noticeable when using Apple Remote Access.
- Finder window titles are now erased before they are overwritten. (Previous versions rendered window titles unreadable in some circumstances.)

This new version of the Finder also includes the following fixes from the prior update's Finder:

- Corrects a problem at startup that could cause the Finder to open the same list of windows over and over again.
- With QuickDraw GX installed, AppleEvents or AppleScript scripts that send Print or Page Setup commands to the Finder are now handled correctly.
- When you try to make changes to a System or Applications folder that is protected by the General Controls panel, the Finder no longer claims there's an access privileges problem. The warning message now describes why the folder can't be changed and how to turn off folder protection.
- Fixes a problem that occurred the first time you started up your computer after installation (or any time you deleted the old Finder Preferences file). One symptom of this problem was a dialog box stating that the Network control panel could not be used.
- Fixes a problem that caused a crash if a sound and a control panel were both in the Startup Items folder and the sound was opened first. (Items in this folder are opened in alphabetical order.)

- The Finder no longer rebuilds the desktop if it finds a folder named Desktop at the root level; now it rebuilds the desktop only if it finds a file called Desktop.
- Improves the way the Finder handles server volumes that are unexpectedly disconnected while files from the server are still open. Now you can save the contents of most files by using the Save As command (in the File menu of most applications). Large files (those that don't fit entirely in memory) might be lost if the server disconnects unexpectedly. With some applications, however, you can copy the contents that are in memory and paste them into a new document, later merging this document with the original file on the server. (With prior versions of the Finder, this situation could lead to serious problems if the user tried saving the document after the server was disconnected.)
- Changes the way the Finder invokes the Find File extension (of System 7.5) instead of the built-in Find feature introduced in System 7.0. The Find File extension now contains a simple "flag" that tells the Finder to use the new Find File. If you disable or remove this extension, the Finder uses only the older built-in Find. This change enables users to choose between the full-scale Find File and its stripped-down version (the built-in Find command).
- Fixes a problem that caused an out-of-memory error if too many Get Info windows were open at the same time.
- Enables users to open a document that belongs to an already-running background-only application. (In previous versions, the Finder searched only through the list that showed up in the Application menu.)
- The Finder Update file was renamed. (It was previously known as the PowerPC Finder Update file.) This file handled Code Fragment Manager (CFM) error-reporting for missing dynamically linked libraries.
- Speeds up copying from servers by letting the server set its preferred block size for copy requests. (Previously, the Finder always requested 4.5K blocks of data from AppleShare or FileShare volumes.)
- Speeds up copying to and from servers by greatly reducing the number of times the Finder checks for user activity during copy operations.
- Speeds up the copying of small files by changing the way the Finder writes parts of the files. (Previously, the Finder rounded up the size of the file being copied to the minimum allocation block size, which, on a 2GB disk, is 64K.) Now the Finder rounds up small files to a multiple of the size of a disk sector (that is, to increments of 512 bytes).
- Fixes a problem in rebuilding the desktop that caused the Finder to skip applications if it encountered a background-only application while rebuilding the desktop database.
- Eliminates problems in opening some applications or having the wrong icon appear. These problems sometimes occurred when, during rebuilds of the desktop, the Finder included applications that did not have the necessary bundle resources. The Finder no longer includes applications that do not have the

necessary bundle resources, eliminating confusion within the desktop database.

- The Finder now ignores aliases to applications when rebuilding the desktop database.

Changes to Find File

- The following are the changes in Find File 1.1.2:
 - Includes a list of Shortcuts, available from the Guide menu (with the question-mark icon) when Find File is active.
 - Includes a new preference used in sorting by Kind, "Use full descriptions for found items," which gives more specific Kind descriptions. Using this checkbox results in slower sorts; not using it results in faster sorts but with less specific Kind descriptions.
 - Fixes a crashing bug that occurred if the same item was dragged to the same location before the Finder finished the earlier move.
 - Fixes a bug that allowed non-numeric data to be input into the Size search field.
 - Fixes a bug that allowed a pasted item to exceed the length of several search fields.
 - Fixes a bug that allowed too many digits to be entered in the Size search field.
 - Allows you to drag a volume icon onto the Location pop-up menu.
 - Fixes the zoom box on 68K systems.
 - Changes the alert message to be more informative when a server being searched is disconnected.
 - Changes the way the Found Items list displays items that are in the Trash after the Trash has been emptied.
 - Fixes a searching bug that occurred when the Kind requested was "font."
 - Fixes a crash that sometimes occurred when clicking the Stop button in the sorting dialog box. This dialog box now displays a spinner during a sort.
 - Fixes a memory bug that sometimes occurred after several consecutive searches.
 - Fixes a display bug with Found Items that occurred when using large font sizes.
 - Fixes the CD-ROM icon in the Drives pop-up menu.
 - Enables Find File to find invisible files, some of which you can move (such as the Desktop, Desktop DB, and the Desktop DF files).
 - The Clear menu item now deletes only the selected text. (The Clear key no longer deletes anything.)
 - Fixes a bug that occurred when dragging a file onto the Kind search field. Fonts and applications now show up as such, not as documents.
 - Fixes a crash that sometimes occurred when dragging an item from the Found Items window to the desktop.
 - Changes the prompt message when search fields are empty.
 - Cleans up Balloon Help.
 - Includes a new preference to specify transliteration.
 - Speeds up searches in 2-byte languages if no transliteration is necessary to perform the search.
 - Fixes a bug where the filename input for 2-byte languages could exceed maximum length.

• The following are changes introduced with System 7.5 Update 1.0 (Find File 1.1.1):

- Fixes a drag problem with large groups of items. Now Find File displays a confirmation dialog box when you drag more than 50 items.
- Fixes a crashing bug when searching for items whose names contain "desktop." Find File no longer finds invisible desktop files unless explicitly requested.
- Fixes a bug that prevented exact-name matches with foreign file systems.
- Fixes the "spontaneous search" bug, whereby Find File could start searching without any criteria entered. Find File now displays an alert prompting for search information.
- Fixes a bug that sometimes prevented an item in the Found list from being selected by clicking its icon.
- Fixes a memory problem in sorting more than 1100 items.
- Fixes a highlighting problem with the Keyboard menu.
- Scroll bars are now properly drawn.
- Fixes a cosmetic problem with drag-selecting items in the Found list.
- Properly updates the path in the bottom of the Found list window after the user drags items from the list.
- Fixes a hanging bug that could occur when dragging a folder onto the search fields.
- Fixes a pop-up menu bug that sometimes showed the wrong value after switching to the Finder and back to Find File.
- Fixes the search when the Comments field is left blank.

Changes to Standard File

- Fixes an occasional crash in Standard File that occurred when the data cache was not flushed before being disabled.
- Fixes a memory leak with some of the dialog boxes used for opening and saving documents in Standard File.
- Fixes a problem in the dialog box used for opening files that could allow the pop-up menu to be dimmed in Standard File.

Changes to control panels

- PowerPC-based computers with PCI slots now use the Monitors & Sound control panel, instead of the Sound & Displays control panel, to control monitor and sound settings. (System Update 2.0 removes Sound & Displays.) You can do a custom installation to install the Sound control panel if you need it for older applications. (The Monitors & Sound control panel works only on PCI-based computers.)
- The Memory control panel now displays "Will be off after restart" if Virtual Memory is turned off, as a reminder that just turning Virtual Memory off does not fully deactivate it.
- The Memory control panel now uses a larger default setting for the disk cache. After you install this software, the new setting will be used only if the Use

Defaults button in the Memory control panel is clicked. The new default is 32K for each megabyte of physical RAM installed, up to a maximum of 4096K. (Virtual RAM is ignored for this calculation.) Thus, a computer with 16MB of physical RAM would use 512K for its default disk cache size, resulting in better performance for disk-intensive tasks than the original default of 96K.

- Fixes a bug in resizing a RAM disk in the Memory control panel while file sharing is on.
- Fixes a problem in General Controls panel that caused problems with Retrospect Remote if either application or System Folder protection was turned on.
- When you open an application by double-clicking a document, you can set the default location of saved items to the folder containing the document you opened, instead of the Documents folder or the folder containing the application. You set this preference by turning on the "Folder that is set by the application" option in the General Controls panel.
- Fixes a problem in General Controls panel that could hang the computer if Applications folder protection was turned on and there was a document or alias named "Applications" at the root level of the startup disk.
- Fixes a problem in the General Controls panel's folder-protection code that could cause folders to become invisible if Stuffit Spacesaver was installed.
- CloseView no longer uses keyboard shortcuts that were already used by the Finder. The new keyboard shortcuts for CloseView are:
 - Command-Option-K: turns CloseView on or off
 - Command-Option++ (the plus sign): increases magnification
 - Command-Option-- (the minus sign): decreases magnification
- If CloseView is active, it remains active after you change the number of colors on your monitor.
- CloseView no longer hangs the system if Balloon Help is on and an audio CD is inserted.
- Includes the following new international keyboard layouts:
 - French Canadian
 - ISO Canadian
 - Spanish
- Installs the updated versions of the following international keyboard layouts if older versions are already installed:
 - Dutch
 - Flemish
 - German

Changes to Apple Guide

- Includes Macintosh Guide 1.3 (and several new Guide Additions files), which provides updated on screen help for system software.

- Includes Apple Guide version 2.0.2, which includes the following improvements:
 - Fixes problems with displaying coach marks in modal dialog boxes.
 - Fixes a serious memory leak that occurred every time a Guide file was opened.
 - Fixes a problem that caused every twenty-first index item to disappear when multiple additions were in use.
 - Fixes a problem that occurred when Apple Guide encountered additions files that did not apply to the current configuration of hardware and system software (for example, if the QuickTime Guide was installed, but QuickTime itself was not installed or had been turned off with Extensions Manager).
 - Defaults to US ASCII sorting only if the current script is Roman and the current language is English. (Apple Guide 1.2.5 defaulted to US ASCII on any Roman script system.)
 - Fixes problems with coach marks on 68K computers. (Coach marks were sometimes drawn on the wrong menus.)
 - Fixes a Look For problem in Japanese computers by first trying to use the script code from the current database.
 - Fixes a bug in <Delete Index> that affected Japanese computers.
 - Fixes problems with mixed-mode handling of installed coach and context handlers.
 - Fixes a problem that sometimes caused Apple Guide to shut down completely on PowerPC-based computers. For example, if a PowerBook additions file was present on a PowerPC-based desktop computer, Apple Guide 1.2.5 would completely shut down because the additions file couldn't be used. Now, Apple Guide ignores the PowerBook addition and continues running.
 - Fixes a problem that prevented Apple Guide 1.2.5 from starting up if QuickTime wasn't installed on the computer. This problem occurred only on PowerPC-based computers.
 - Includes localizable error strings for use in various abort messages.
- Also includes all the improvements to Apple Guide introduced with System 7.5 Update 1.0 (Apple Guide 1.2.5):
 - Works faster than prior versions on all Mac OS-based computers.
 - Is native on PowerPC-based computers, which also improves performance.
 - Is compatible with At Ease.
 - Makes additions files available in the Guide menu even if the application was opened with AppleScript.
 - Fixes a memory leak of an international resource, which occurred every time a Guide file was opened.
 - Makes windows redraw correctly after coach marks are drawn.
 - Updates no more of the screen than it needs to.
 - Properly draws coach marks in black and white and on a mirrored monitor.
 - Keeps scroll bars active when they should be active.

Changes to Apple Menu Options

- Includes Apple Menu Options v.1.1.2, which introduces the following changes:

- Performs better, with improved stability.
 - Fixes a problem that could hang the computer when the Apple Menu Options preference file was dragged to the Trash.
 - Fixes a problem that could hang the computer if there was a locked alias in the Recent Documents, Recent Applications, or Recent Servers folders. The new version ignores locked aliases.
 - Moved a large 68K patch that caused a general slowdown on PowerPC-based computers. This patch is now active only while the mouse button is held down on the menu bar or in a menu.
 - Increases the height of the editing field used for entering the number of documents, applications, and servers.
 - Fixes a problem that could prevent the Recent Documents, Recent Applications, and Recent Servers folders from being deleted when tracking of those items is turned off.
 - Fixes a problem that could cause Apple Menu Options to hang if its settings were changed and the System Folder was on a locked volume (such as a startup CD or locked floppy disk). The hang would occur when Apple Menu Options tried to write the new settings into the locked preferences file. The new version does not try to record new settings on a locked volume.
 - Fixes a problem with sorting order; Apple Menu Options no longer uses the U.S. standard for modified Roman and Scandinavian alphabets.
 - Prevents Apple Menu Options from deleting original files -- it can now only delete aliases. (This change solves a problem that occurred when users saved documents directly into the Recent Documents folder. Once the document was saved, Apple Menu Options replaced the file with an alias to that file.)
 - Fixes a problem that sometimes caused the contents of the Apple menu to show up in place of the proper contents for submenus.
- Incorporates all of the prior fixes to Apple Menu Options:
- Improves performance.
 - Fixes a problem that could cause an application's menus to disappear.
 - Fixes a problem that could leave the Apple menu highlighted if an application was opened from a submenu within the Apple menu.
 - Shows non-AppleShare servers in the Recent Servers sub-menu.

TOPIC -----

This article is the System 7.5 Technical Details (part 2 of 3) document.

DISCUSSION -----

System 7.5 Technical Details (part 2 of 3)

This file is one of several Read Me files that describe technical details between system software version 7.5 and system software version 7.5.3. This information is most appropriate for advanced users. For less technical information, see the About System 7.5 document, the Installing System 7.5 document, or the What's New in version 7.5.3 document.

What's in this document (part 2 of 3)

- Changes to SimpleText
- Changes to the Launcher
- Other new or changed components
- Miscellaneous fixes and enhancements
- Files no longer needed

Changes to SimpleText

- Includes SimpleText version 1.3.1, which supports QuickDraw 3D.
- Includes the following enhancements introduced with the version of SimpleText provided with System 7.5 Update 1.0:
 - Large documents, PICT files, and page ranges (for example, pages 2 and 3 of a 5-page document) print correctly.
 - Page Up, Page Down, and scrolling work better with Portable Digital Documents (PDDs) and other documents.

- Editing features (such as Cut, Copy, the forward delete key on extended keyboards, underlining, and selected text highlighting) work correctly.
- SimpleText documents that use system fonts now retain their fonts when opened on a computer with a different system font.
- Remote program linking (controlling SimpleText with AppleScript from another computer) is enabled by default.
- In the Don't Save/Save/Cancel dialog box, you can type "D" or Command-D for Don't Save.
- If you choose Quit with an unsaved document, and want to cancel the quit, you can do so by choosing Save in the Don't Save/Save/Cancel dialog box, then choosing Cancel in the Save dialog box.

Changes to the Launcher

- Includes Launcher version 2.8, which incorporates minor "behind the scenes" changes not likely to be visible to users.
- Launcher version 2.8 also includes the following fixes and features, introduced in System 7.5 Update 1.0:
 - Supports Macintosh drag and drop, making it easier to add or remove items.

To add an item: Open the Launcher and drag the item into the Launcher window or onto a category button. The system creates a new Launcher button for the item by placing an alias in the Launcher Items folder. The original item remains on your hard disk.

To remove an item from the Launcher: Hold down the Option key and drag the button out of the Launcher.

To move a Launcher button to a new category: Hold down the Option key and drag the button to a category button along the top of the Launcher window.

To open a file using the Launcher: Drag the file's icon onto a Launcher button that represents an application program. For example, you can open a SimpleText file by dragging its icon onto the SimpleText button. If the program the button represents can open the file, the button is highlighted when you drag the file to it.

To put a file into a folder: Drag the file's icon onto the Launcher button that represents the folder.

To resize the currently visible Launcher buttons: Hold down the Command key and click inside the Launcher window. Then choose a new size from the pop-up menu.

To open a category button's folder (located in the Launcher Items folder): Hold down the Option key and click the category button.

Other new or changed components

- Includes Open Transport v.1.1, a major re-implementation of the network system software for use on all 68030-, 68040-, and PowerPC-based computers except the desktop 5200, 5300, 6200, and 6300 series computers. If you choose the Easy

Install option, Open Transport will be turned on only if it you were using it before you installed this version of system software.

For more information, see the Open Transport Information folder, inside the Apple Extras folder.

- The Network Software Selector (NSS) enables users of 68030-, 68040-, and early PowerPC-based computers to choose between Open Transport and classic AppleTalk if both are installed. (You must restart the computer for the change to take effect.) PCI-based computers support only Open Transport.

NSS is in the Apple Extras folder; information on using it is built into the application. NSS is intended to ease the transition to Open Transport by allowing you to use the older networking software if there is a compatibility problem with an application and Open Transport. Once the problem is resolved, you should switch back to Open Transport.

Note: Because MacTCP is incompatible with Open Transport v.1.1, MacTCP is disabled any time Open Transport is selected using the Network Software Selector. (Open Transport uses the TCP/IP control panel instead of MacTCP.) If you reselect classic AppleTalk, MacTCP is enabled again.

- For users of the older networking software, this update includes MacTCP 2.0.6, which

- shortens retransmission delays
- prevents potential out-of-memory errors
- makes configuring communications easier
- gives users more control over which servers to contact and in what order

- Includes SerialDMA 2.0.2 for use on all PowerPC-based computers, the Centris 660AV, Quadra 660AV, Quadra 840AV, as well as the corresponding Performa and Apple Workgroup Server products. SerialDMA provides a complete rewrite of the DMA serial driver, which originally accompanied these computers, thus fixing the occasional system hang, communications time outs, poor communications performance, and other glitches. The new SerialDMA 2.0.2 driver also exceeds the performance and reliability standards for serial communications on the Mac OS platform, providing support for speeds of up to 230,400 baud.

- SerialDMA 2.0.2 is native on PowerPC-based computers.

- Includes a new version of Apple Modem Tool (1.5.5), which supports 115.2K and 230.4K connections on SerialDMA 2.0 machines.

- Includes the latest version of PC Setup (v1.0.7) for use with all DOS Compatible Mac OS computers.

- Includes Screen control panel version 1.0.7. This new version does not crash if it's in the System Folder of a Macintosh SE during startup or when it's opened on any 68000-based Mac OS computer.

- Includes File Sharing 7.6.2. Now, when file sharing is turned on, removable disks and CD-ROM discs will automatically be shared (except for audio CDs, which will no longer be shared). You no longer have to turn off file sharing to eject

a removable disk or CD-ROM disc, as long as no one is currently connected to that volume.

- Includes a faster version of the AppleShare Workstation client software. The new version performs read-ahead and write-behind caching, allowing the Finder to write to a local volume while reading from a remote volume (and vice-versa). The new version also briefly caches some information from the desktop database to avoid unnecessary hits to the disk.

- Includes Apple Video Player 1.4.

Miscellaneous fixes and enhancements

- The Shut Down warning, which appears during startup if the computer was shut down improperly, dismisses itself after two minutes so that startup isn't further delayed. Note that this warning can be turned off completely in the General Controls panel.

- Includes Macintosh Easy Open 1.1.2, which fixes delays when dragging Finder folders.

- The dialog box displayed after the keyboard Power key is pressed cancels itself after one minute.

- Fixes a problem with the Power key. In previous versions, if the Power key was held down just a little too long, the hardware could miss the release of the key. If the next key pressed was the Command key, the hardware would mistakenly think that Command-Power had been pressed and would bring up the programmer's window (or MacsBug if it was installed).

- Color Picker no longer crashes during startup. There is a problem with certain third-party SCSI drivers that mark the drive as removable at the beginning of startup and later mark it as non-removable. Because Color Picker creates an alias to itself during startup, the change to non-removable prevented the Color Picker alias from being resolved later. Color Picker now handles the failure to resolve this alias.

- Fixes a problem introduced by System 7.5 Update 1.0 that prevented 2-byte characters from being used when naming a DOS disk.

- Fixes a problem that allowed the Menu Manager to use an unlocked handle. This fix will eliminate some crash problems, especially when using certain pop-up menus.

- Changes several video drivers to provide better support for new monitors introduced since System 7.5 was released.

- Handles low-memory situations better than previous releases of Sound Manager.

- Fixes a problem that allowed the sound volume to be lower after restarting than it was before restarting; volume should now be properly preserved when restarting.

- The state of the Mute checkbox in the Sound control panel's Volume window is now preserved across restarts.
- Fixes a problem that allowed QuickDraw to leak about 50 bytes of memory in some isolated circumstances.
- Fixes a problem that allowed a nonexistent disk drive to show up in Disk First Aid.
- Fixes a crash problem in the Communications Toolbox that happens if there are more than about 600 zones on a single network. The new limit is just over 8000 zones.
- Fixes a problem on the 630 and 5200 series computers that would cause them to ignore the infrared remote control.
- Fixes a problem that made it take two attempts to unmute the sound using the infrared remote control on 630 and 5200 series computers.
- Presents a dialog box that advises users that audio CDs cannot be shared if an audio CD is selected and the "Share a Folder" or "Share a Folder (no Guest)" automated task is executed. (In the past, the system would hang in this situation.)
- Fixes a bug that caused the wrong font to be used in some cases.
- Fixes a problem that allowed a garbage pattern to be used when redrawing the pattern in a scroll bar.
- Fixes a problem with submenus drawn too large or not drawn at all.
- Fixes a problem that sometimes caused the startup progress bar to draw improperly.
- Fixes a problem in WorldScript Power Adapter that could cause text to wrap randomly in Text Edit fields, or to appear garbled.
- Plugged a small memory leak that sometimes occurred when resizing a window.
- The Power key can now be used to turn the computer off. To shut down the computer, press the Power key. When the dialog box appears, you can shut down your computer, restart your computer, put it to sleep (if it supports sleep), or cancel the shutdown. PowerBook 100 series computers do not have a Power key on their built-in keyboard, but if you attach an external keyboard, you can use the keyboard's Power key (as just described) to turn off the computer. This functionality is not supported on the Macintosh Plus.
- The Synchronize Folders AppleScript automated task handles nested folders properly.
- A new AppleScript automated task-Share a Folder (No Guest)-lets you automatically share a folder with the Guest access disabled.

- Improves system stability when memory is very low.
- Fixes a potential crash problem when shutting down or restarting Japanese systems with QuickTime 2.0 installed.
- Fixes a potential crash problem when pasting large amounts of data.
- No longer opens the wrong original when you select an alias on the desktop of a disk other than the startup disk.
- No longer interferes with custom colors that some applications use in the Open and Save dialog boxes.
- Fixes a potential crash problem that occurs when Stickies opens with a "collapsed" note window.
- Fixes a problem that would allow the Options button in Sound control panel's Sound In window to be dimmed when it should be enabled.
- Fixes sound problems in the Jigsaw Puzzle (caused by a third-party extension).
- PowerTalk Catalogs Extension version 1.1.1 no longer displays an out-of-memory error when you open a catalog.
- PowerTalk AppleMail version 1.1.2 works better on systems with many fonts installed and defaults to "sender only" for mail replies.
- PowerTalk DigiSign Utility version 1.1.1 improves printing on HP DeskWriter C and 550-style printers.
- Direct Dialup version 1.1.1 works better when dialing using a long string and won't time out while sending a large letter or a letter with a large enclosure.
- Fixes a potential crash problem that occurs if both PowerTalk and At Ease are installed. While PowerTalk and At Ease no longer crash when used together, accessing all of Power Talk's functionality requires the Finder (open the Special menu in At Ease and choose Go To Finder).
- Command-Option-Space bar no longer changes the keyboard layout if multiple layouts are installed. This avoids a conflict with some popular games that used these keys for controls within the game, resulting in a seemingly random layout being selected once the game is finished (during the game, the selected layout would change any time the three keys were pressed at once). If you want this functionality restored, open the Keyboard control panel and click the checkbox at the bottom. The conflict with certain games will exist as long as this box is checked.
- WindowShade version 1.3.1 fixes a potential crash problem that occurs when memory is very low.
- Macintosh Easy Open version 1.1.1 works better with drag-and-drop on document converters.

- Fixes a problem in the Menu Manager that could cause memory fragmentation within an application's heap.
- File Sharing no longer causes a crash when Find File is searching a remote volume using Apple Remote Access.
- Fixes a problem in file sharing that caused some files not to get copied. (The symptom of this problem was a dialog box stating that the file could not be copied because it couldn't be found.)
- Fixes a problem causing Type 8 errors on PowerBooks.
- Fixes a problem causing the cache to be erased on PowerBooks.
- PC-formatted floppy disks on PowerBooks will no longer be unreadable on PCs after use on a PowerBook 500 series computer that has been upgraded to a PowerPC.
- Fixes a problem with the DREmulator on PCI-based computers, and the PowerBook 5300 and 2300 series computers.
- Fixes a problem with correctly starting up from the disk selected in the Startup Disk control panel.
- Fixes a problem using SCSI devices on PCI-based computers with 1 gigabyte hard disks.

Files no longer needed

The software automatically deletes the files listed below -- unless you renamed any of them, in which case, you should remove the files.

- Several standalone files are now merged into the System 7.5 enabler, the System 7.5.2 enabler, or the System file. This software deletes the old (standalone) versions of the following files:

- 7.5.2 Printing Fix
- 040 VM Update
- 601 Processor Card Enabler
- 630 SCSI Update
- CFM Updater
- Color Classic Update
- Color Classic Update
- Display Enabler 2.0
- EM Sound Update
- MathLib
- Mount IDE Drive
- Network Software Installer (v1.5.1 and later)
- PowerBook 150 Update
- PowerBook 2300c Update
- PowerBook 5300/2300/190 Enabler
- PowerPC Enabler

- SCSI Manager
- SCSI Manager 4.3 (a renamed version of SCSI Manager)
- Serial Update 406
- SerialDMA
- Sound Manager
- System Enabler 406
- ThreadsLib
- Workgroup Server Enabler

• Several standalone files have been merged into the System 7.5.2 Update enabler. The update deletes the old (standalone) versions of the following files:

- 7.5.2 Printing Fix
- CFM Updater
- PowerBook 5300 Enabler
- PowerBook 5300/190 Enabler
- SerialDMA
- Sound Manager
- System Enabler 701
- ThreadsLib

•• Several standalone files have been merged into or been replaced by various other pieces of the system. The update deletes the old (standalone) versions of the following files:

- Sound & Displays (replaced by Monitors & Sound)
- Apple Multimedia Tuner (rolled into QuickTime 2.1)
- LaserWriter 8.0 (replaced by LaserWriter 8)
- PowerPC Finder Update (renamed in System 7.5 Update 1.0 and merged into the Finder)
- Finder Update (rolled into the Finder)

System 7.5 v7.5.3 Technical Details: Part 3 of 3 (8/96)

Article Created: 21 June 1996
Article Reviewed/Updated: 5 August 1996

TOPIC -----

This article is the System 7.5 Technical Details (part 3 of 3) document.

DISCUSSION -----

System 7.5 Technical Details (part 3 of 3)

This file is one of several Read Me files that describe technical details between system software version 7.5 and system software version 7.5.3. This information is most appropriate for advanced users. For less technical information, see the About System 7.5 document, the Installing System 7.5 document, or the What's New in version 7.5.3 document.

What's in this document (part 3 of 3)

- Changes for PowerPC-based models
- Changes for PowerBook and Duo models
- Changes for other 68K-based models
- Changes for PC cards
- Changes for AppleVision monitors
- Changes related to printing
- Known problems and their workarounds
- Tips

Changes for PowerPC-based models

• PowerPC-based computers with PCI expansion slots now use the Monitors & Sound control panel to control monitor and sound settings instead of the Sound & Displays control panel. You can do a custom installation to install the Sound control panel if you need it for older applications.

• Includes native SCSI (not on desktop 5200, 5300, 6200, and 6300 series

computers).

- Fixes a SCSI

Manager problem that would hang any PowerPC-based computer if a Sony or WangDAT DAT drive was used with Retrospect.

- Fixes a problem on desktop 5200, 5300, 6200, and 6300 series computers running QuickTime 2.1 that would prevent sound from being heard in Fusion Recorder's Record window until either a recording was started or the TV volume in the Sound control panel was unmuted.

- Includes both native and 68K versions of common Modern Memory Manager routines, improving performance of emulated applications by speeding up calls to common routines. (System software versions 7.5 and 7.5.1 included only the native implementations, while system software version 7.5.2 included both native and 68K versions.)

- Includes a rewritten fixed-point math library to provide better performance for QuickDraw, other parts of the system, and all applications that use this library. Because QuickDraw and other parts of the System use this library extensively, installing this update will cause noticeable performance gains.

- PowerPC-based computers with PCI expansion slots might have a different physical Ethernet address after you install this software. The software fixes a bug that caused an incorrect physical Ethernet address to be used in environments where TCP/IP addresses are obtained using BootP, DHCP, or RARP. To see the new Ethernet address after you install this software, open the File menu in the AppleTalk or TCP/IP control panel and choose Get Info. If you install this software and are no longer able to use your TCP/IP-based applications, contact your network system administrator.

- On PowerPC-based computers (including those with PowerPC Upgrade cards) running system software version 7.5 or 7.5.1, this software version introduces the Native Resource Manager. This version of the Native Resource Manager is slightly newer than the version released with system software version 7.5.2. The System 7.5.2 Update file includes the same improved version of the Native Resource Manager.

- Reduces times to open applications on PowerPC-based computers with virtual memory turned on. System 7.5.2 (not 7.5 or 7.5.1) would significantly slow down while opening certain applications, such as Microsoft Excel version 5.0, if virtual memory was turned on. With this system software version installed, launch times should be about the same whether or not virtual memory is turned on.

- Fixes a bug affecting plug-ins that import from an application. This problem existed in all PowerPC-based computers running system software versions 7.1.2, 7.5, 7.5.1, and 7.5.2. and was originally fixed by the CFM Updater extension (distributed with QuickDraw 3D). This version of system software deletes this extension, which is no longer needed.

- Fixes a bug in starting up from removable media with virtual memory on. (Although this bug was fixed in 7.5.2, it still exists in 7.1.2, 7.5, and 7.5.1

PowerPC computers.)

- Fixes problems with the DR Emulator. (The DR Emulator works only on PCI-based computers and the PowerBook 2300, 5300, and 500 upgrade.)
- Fixes a problem in certain IDE drives that resulted in cached data not being written to the disk at shutdown.
- Fixes anti-aliasing errors for Kanji Type 1 fonts.
- Fixes a problem that resulted in off-white often being drawn as white. (This effect, while generally subtle, was significant enough for some applications to merit a fix.)
- Fixes a crash problem (a Type 11 error) in Native QuickDraw; this error occurred when using Quark XPress v3.1.1 with system software versions 7.5 and 7.5.1. System 7.5.2 and later versions corrected this problem. If you have Type 11 errors when using Quark XPress 3.3.1 with System 7.5.3 on a PowerPC-based computer, one suggested solution is upgrading to the latest version of Quark Express.
- Fixes a problem in the Dialog Manager that caused some applications to crash after a dialog box was dismissed.
- Supports DayStar Turbo 601 cards in a Macintosh IIci or IIsi.
- If you use Microsoft Office 4.2.1, you need the extension "Office 4.2x Update For Power Mac," version 1.0.1, and the Microsoft Office Manager control panel, version 4.2.1b. You can download these files from the Internet. Download the MC1164.HQX and MOMPATCH.HQX "patch" (update) files from Microsoft. The patches are available on the Internet at

<ftp://ftp.microsoft.com/softlib/mslfiles>

- Includes changes to native QuickDraw which speed up operations such as scrolling, image filtering, and pattern and text drawing. ("Native QuickDraw" refers to time-critical portions of QuickDraw that have been native since the initial release of PowerPC-based computers.
- Updates video software, thus prevent video scrambling during computer startup.

Changes for PowerBook and PowerBook Duo models

-
- Contains a new version of password security software. The version that shipped with the PowerBook 5300 and the PowerBook 190 computers could lock out international users since the software to handle international keyboards does not load until after the password is requested during startup. If the password contained a character that was not available on a U.S. keyboard, it could not be entered and the computer could not finish starting up. The new version of the password security software fixes this problem.
 - Fixes a problem in the Assistant Toolbox that caused the Assistant Toolbox to

be incompatible with Open Transport.

- Fixes a problem that prevented PowerBooks and PowerBook Duos from going to sleep if SimpleText or certain other applications were running in the background.
- Fixes problems with the DR Emulator. (The DR Emulator works only on PCI-based computers and the PowerBook 2300, 5300, and 500 upgrade.)
- PowerBook Duo docks: Pressing the eject button automatically opens items in the Shutdown Items folder and shuts down the computer. No dialog box appears.
- PowerBook 500 models: Improves trackpad performance.
- PowerBook 150: Extends battery life by reducing power requirements during sleep mode. It also prevents the system from freezing when you repeatedly use the internal modem without restarting the computer.
- PowerBook 150: Eliminates the need for the PowerBook 150 Update system extension. Installing Update 2.0 automatically removes this extension from the Extensions folder (inside the System Folder).
- PowerBook 150: Fixes a problem that prevented the internal IDE disk from appearing on the desktop. The problem occurred if the internal IDE disk was selected as the startup disk, and the Command-Shift-Option-Delete keys were held during startup (to start up from an external hard disk).

Changes for other 68K-based models

-
- Quadra 900 and 950: Fixes a problem in the Sound control panel. Before this version of system software, the External Line and Internal CD buttons in the Sound control panel were reversed, so that clicking the Internal CD button was interpreted as though the External Line button had been clicked (and vice-versa).
 - Quadra 950: Fixes a problem with the Sound control panel. Before this software version, clicking the Add button sometimes caused the computer to crash.
 - Centris 660AV, Quadra 660AV, and Quadra 840AV: Includes Apple Video Player v.1.4, which replaces the Video Monitor application (which is no longer supported).
 - Quadra 840AV, Quadra 660AV, and Centris 660AV: Includes new video software that prevents video scrambling during computer startup.
 - Quadra 840AV, Quadra 660AV, and Centris 660AV: Fixes a problem in the Dialog Manager that caused some applications to crash after a dialog was dismissed.
 - Performa 630, Quadra 630, and LC 630 with internal IDE drives: Fixes a problem that prevented the internal IDE disk from appearing on the desktop. The problem occurred if the internal IDE disk was selected as the startup disk, and the Command-Shift-Option-Delete keys were pressed during startup (to start up from an external hard disk).

- Quadra 700: Fixes a potential problem that could slow down the mouse or trackball.
- Quadra 840AV: Includes an updated Display Manager which ensures that a multi-sync monitor is set to the correct resolution when you restart the computer.

Changes for DOS Compatibility Cards

- Macintosh Easy Open version 1.1.1 fixes problems with cut and paste between Mac OS and PC applications on Mac OS computers with a DOS Compatibility Card installed.
- Quadra 610 and Centris 610 computers with the 610 DOS Compatibility Card installed receive PC Setup version 1.0.2 (software that was inadvertently not provided with the upgrade disks for System 7.5).

Changes for AppleVision monitors

- If you use AppleVision software, use version 1.0.2 or later. Earlier versions of AppleVision are not compatible with this software.
- If you have a 1710AV monitor and a PCI-based computer, use AppleVision 1.0.4 and the Monitors & Sound control panel.
- If you have a 1710AV monitor and a non-PCI-based computer, use AppleVision 1.0.2, the Sound control panel, and the Monitors control panel.

Changes related to printing

- Includes version 2.1.1 of the StyleWriter 1200 driver, which fixes a crash bug on System 7.5.2-capable computers.
- Includes the LaserWriter 8F (version 8.2.3F) driver, which supports all the fax options on the LaserWriter 16/600. The LaserWriter 8 (version 8.3.3) driver does not support all these fax options.
- Supports QuickTime compressed images and ColorSync 2.0 through the LaserWriter 8 (version 8.3.3) driver.
- The LaserWriter 8 (version 8.3.3) and LaserWriter 8F (version 8.2.3) drivers contain fixes for two common printing problems found on PCI-based computers: freezing when trying to print to a printer that's busy, and freezing when trying to print large documents or printing to LocalTalk-based printers.
- The LaserWriter 8F, version 8.2.3, printer driver provides the following enhancements (introduced in version 8.2):
 - Improves the function of the Setup button in the Chooser; this button automatically looks for the selected printer, selects the appropriate PostScript Printer Definition (PPD) file, and configures the paper trays. (If you prefer to manually configure the PPD files and paper trays, you can do so by clicking the

Setup button a second time.)

- Resets the destination in the Print dialog box to Printer instead of retaining the previous print job's destination. For example, if the previous destination was Fax, the destination automatically resets to Printer for the next job.
- Enables you to tab backwards through the fields in all print dialog boxes by pressing Shift-Tab.

Note: Installing the LaserWriter 8F version 8.2.3 printer driver removes the LaserWriter 8 Prefs file from your system. Thus, after you install, you need to set up your printer using the following steps:

1. Open the Chooser.
2. Click the LaserWriter 8 icon.
3. Click the printer you want to use.
4. Click the Setup button.

Known problems and their workarounds

- Apple Video Player displays an incorrect dialog box if it's opened on a computer that does not have video-in capability. Apple Video Player complains that the Video Startup extension was not installed properly instead of stating that video-in is required for this application to run.
- If, when you try to print, you see a message that your printing preferences are missing or damaged, open the Chooser and select a printer.
- Some versions of the LaserWriter driver (version 7.2 and earlier) and the QuickDraw GX printer drivers still have the problems that interfere with PCI-based computers trying to print on a busy printer or trying to print large documents. If you experience these problems, select the LaserWriter 8.3.2 driver from the Chooser.
- Two different control panels are named "Energy Saver." The older version worked by dimming the external screens of certain computers. The newer Energy Saver, which works differently, works only on PowerPC computers with PCI slots.

The universal System Folder (created by choosing Any Macintosh in the Custom Install option) that can be created by this system software version contains only the newer Energy Saver. If your universal System Folder requires both versions of the Energy Saver, do the following:

1. Rename the newer Energy Saver.
 2. Use the Custom Install option to install the older Energy Saver.
- The new minimum RAM disk size is 416K. If a smaller RAM disk exists during the installation of this software, it will be turned off and its contents lost when the computer is restarted. Therefore, before installing this software on a computer with a RAM disk smaller than 416K, move all the contents of the RAM disk to another disk.
 - Digital audio recording and playback can occasionally "skip" if virtual memory

is turned on. To reduce this skipping, turn off virtual memory.

- HyperCard version 2.3.3 or earlier does not record sound properly on computers with PCI slots. Other sound-recording application programs, including SimpleSound and the Sound control panel, can record sounds that you can import and play within HyperCard 2.3.

- When used with SerialDMA, DOS Compatibility software will not be able to use hardware handshaking on the PC serial port.

- There is an incompatibility between AppleShare Workstation software version 3.6.1 and Connectix Speed Copy (part of Speed Doubler version 1.1 or earlier). Use the Extensions Manager to turn off Speed Copy before you install this software, and contact Connectix to get the latest version of Speed Doubler. (You can contact Connectix at <http://www.connectix.com>, 415-571-5100, or 800-950-5880.)

- If you are using the IR port and Open Transport on a PowerBook 190, and networking doesn't work after you restart the computer, try putting the computer to sleep and waking it up, or choose the printer/modem port and then switch back to the IR port.

- The Ethernet Compatiblity extension version 1.0.3 fixes a problem in the Macintosh system shutdown code for PCI-based PowerPC computers running some network software, including Novell Netware. The side effect of this fix is a two-minute delay in shutting down the computer.

- When using Drive Setup (version 1.0.4 or earlier) on some IDE hard drives, the "Update driver," "Customize volume," and "Test disk" options are dimmed. To use these options, back up all data from the IDE disk onto another disk, and use Drive Setup to reinitialize the IDE disk.

- If you have a Macintosh Centris 660AV, Quadra 660AV, or Quadra 840AV, some system alert sounds may not play correctly with the alert volume turned down. To avoid the problem, keep the alert volume turned all the way up and adjust the Built-In system volume:

1. Open the Sound control panel.
2. Choose Volumes from the pop-up menu.
3. Adjust the volume.

- Speech version 1.4.1 can cause a Macintosh Plus (a model which does not support speech) to hang during startup. If your Macintosh Plus hangs during startup, do the following:

1. Restart the computer while holding down the Space bar.
2. When the Extensions Manager dialog box appears, turn off Speech.

- If your computer has a 68000 processor and the computer won't start up, try pressing the Shift key (to turn off extensions) while you restart. If there is a "Color StyleWriter 2000 CMM" file in your Extensions folder (inside the System Folder), take this file out of the Extensions folder and restart your computer. (To use the Color StyleWriter 2000 series printer, you need a 68020 or higher

processor.)

Tips

- Many LaserWriter LS users are unaware that this printer is supported by the LaserWriter 300 driver. To make this clear, future system releases will rename this driver to LaserWriter 300/LS. For now, you can either rename this driver or wait for a future release to do it for you. If you rename it, you must select the new name from the Chooser before you can print using this renamed driver.

- Recent-documents tracking (in Apple Menu Options) tracks all files that are opened -- even those opened by an application as part of its launch sequence (such as drop-in filters used by desktop publishing packages). This tracking can significantly slow down the launching of these applications. To reduce this overhead you can:

- turn off "recent documents" tracking in the Apple Menu Options control panel
- turn off Apple Menu Options in the Extensions Manager

- This update resets all settings in the Apple Menu Options control panel to their default values. If you have made changes to Apple Menu Options, you will need to select them again after installing this update. If you have set Apple Menu Options to track more than ten items in any category, you may want to move some of those aliases out of their folders before you install the update, which deletes all but the ten most recent items in each category.

MacDNS: Number of Domains Supported (6/96)

=====

Article Created: 24 June 1996

TOPIC -----

I am setting up a WWW server on my Macintosh. I want to use MacDNS for all of my DNS services, which needs to serve 20 domains. Can MacDNS handle this?

DISCUSSION -----

There is no limit set in MacDNS, however, there is a limitation in the Mac OS file system of 346 open files. Each zone file counts towards this limit. Each zone file will also increase the application's RAM requirement by about 2 KB.

DOS Compatibility Card Software Version 1.5 & Mac OS (6/96)

Revised: 6/24/96
Security: Everyone

DOS Compatibility Card Software Version 1.5 & Mac OS (6/96)

=====

Article Created: 24 June 1996

TOPIC -----

What version of the Mac OS is recommended for use with PC Setup Version 1.5 and a DOS Compatibility card?

DISCUSSION -----

PC Setup 1.5 is supported on System 7.1.2 or System 7.5.3 (with either System 7.5 Update 2.0, or pre-installed System 7.5.3). Other versions of the Mac OS may cause unpredictable results. Note that System 7.1.2 is only supported on the Power Macintosh 6100 DOS Compatible. System 7.5.3 can be installed on any Macintosh that supports a DOS Compatibility Card.

RealAudio and the Number of Simultaneous Streams (6/96)

Revised: 6/24/96
Security: Everyone

RealAudio and the Number of Simultaneous Streams (6/96)

Article Created: 24 June 1996

TOPIC -----

This article describes the number of simultaneous streams RealAudio supports on Apple Internet Software Solution server computers.

DISCUSSION -----

The RealAudio software which shipped with the Apple Internet Software Solution has a 5 user license. The following are excerpts from the Administration Guide that come with the product:

Streams

The RealAudio Server and the accompanying encoding application enable you to create and deliver RealAudio content. The number of simultaneous users who can listen to content sent from your server at any given time is referred to as the "number of streams." The number of streams a server can deliver depends upon three factors: the type of RealAudio Server you have, the power of your Server computer, and the bandwidth between your Server and the Internet (each audio stream requires 10 KB per second of network bandwidth).

Maximum Audio Connections

The maximum number of simultaneous audio connections your server can support is five. This entry allows you to set a limit less than or equal to this number. To specify a different value, enter it into the Audio field. The maximum number of connections cannot usefully exceed the maximum number that the bandwidth of your Internet connection will support.

Security: Everyone

Newton Internet Enabler: MP130 update 2.0 (526167) (6/96)

=====

Article Created: 25 June 1996

TOPIC -----

I came across this new system update (526167) while downloading the newest version of the Newton Internet Enabler. I checked my Newton 130 and it is 2.0 (526060). Is this update newer than the one which shipped with the 130 and what is it for?

DISCUSSION -----

The newest Newton system update for the MessagePad 130 (version 526167) is used to correct problems with applications that allocate large chunks of store memory, such as the Newton Internet Enabler (NIE).

Developers of products which use the NIE may also be distributing this update. This update will not be part of any official system update offered to MessagePad owners at this time.

This update is designed for the NIE developers and for customers who purchase a product that uses the NIE software. The update can be found on the Apple Developer Services web site.

For developers, questions on NIE v1.0 will be addressed through the usual channel of support (for US and Canada, DEVSUPPORT@applelink.apple.com). Other users can send mail to NEWTONDEV@applelink.apple.com.

Any particular NIE connectivity issues must be addressed with your Internet Service Provider.

Apple Remote Access 2.1 and Powertalk (6/96)

Revised: 6/25/96
Security: Everyone

Apple Remote Access 2.1 and Powertalk (6/96)

=====

Article Created: 21 June 1996

TOPIC -----

I just installed Apple Remote Access (ARA) 2.1 and the Remote Access Setup Control panel will not open. When launching the Control Panel, I get a dialog box that says something about files not being found and then it exits back to Finder when I click OK. What is wrong?

DISCUSSION -----

Overview

An incompatibility between ARA 2.1 and PowerTalk has been discovered. The incompatibility prevents ARA 2.1 Client and the ARA 2.1 Personal Server from working. This issue does not occur with System 7.5.3.

The CCL scripts for ARA 2.1 are no longer in the Extensions folder. They have been placed into the Modem Scripts folder within the Extensions folder. As a result of this change ARA loads its own Alias Manager, which is shared with the Folder Manager.

Unfortunately, PowerTalk, which loads later than ARA, seems to completely replace the ARA version of the Alias Manager. This renders ARA unusable since neither the Remote Access Setup control panel, nor the underlying ARA driver can locate the Modem Scripts folder.

Workaround

Upgrade to System 7.5.3 which has a new Folder Manager. Both ARA and PowerTalk recognize the Alias Manager they need is already present and do not install their own.

Renaming ARA's extensions in attempt to modify load order will not work because ARA loads code before normal extensions/control panels load.

Power Macintosh 7200: EDO Memory Can Damage Logic Board (6/96)

Article Created: 18 June 1996

TOPIC -----

I have a Power Macintosh 7200 series computer, and I would like to use EDO (Extended Data-Out) memory in my computer because I have heard that it will provide me with increased performance. Are there any issues I should be aware of before doing this?

DISCUSSION -----

You cannot use EDO memory in the Power Macintosh 7200 computer. Using EDO memory in the Power Macintosh 7200 computer can cause damage to the logic board and to the memory. Because of this, Apple does not support using EDO memory in the Power Macintosh 7200 computer. Any damage incurred from using EDO memory in the Power Macintosh 7200 computer may not be covered under Apple Computer's limited hardware warranty.

The Tech Info Library article, "Macintosh Computers: Using EDO Memory" provides you with additional information about using EDO memory with other Power Macintosh computers.

LaserWriter 12/640 PS: Paper Sizes & Imageable Area (6/96)

Article Created: 24 June 1996

TOPIC -----

What is the imageable area for the LaserWriter 12/640 PS printer?

DISCUSSION -----

The LaserWriter 12/640 PS printer supports the following page sizes and imageable areas:

Begin_Table

Paper Type	Physical Page Size (points)	Imageable Area (points)
Letter	612 x 792	587.52 x 767.88
Lettersmall	612 x 792	562 x 742
Legal	612 x 1008	587.52 x 983.88
Legalsmall	612 x 1008	562 x 958
A4	595 x 842	572.16 x 817.8
A4small	595 x 842	545 x 792
A5	420 x 595	399.36 x 570.84
B5 (JIS)	516 x 729	491.52 x 704.88
Executive	522 x 756	499.2 x 732.48
EuroPostCard	284 x 420	272.64 x 391.50

+=====+			
+=====+			
Envelope Type	Physical Size	Imageable Area	
	(points)	(points)	
+=====+			
COM-10	297 x 684	272.64 x 656	
+-----+			
Monarch	279 x 540	257.28 x 512	
+-----+			
C5	459 x 649	433.92 x 621	
+-----+			
DL	312 x 624	288 x 596	
+=====+			

Note:

- The fractions are due to conversion from pixels to points.
- To convert from points to inches divide the number by 72.
(1-in. = 72 points)

End_Table

LaserWriter Printable Area Margins

=====

Left = 4.0 mm (0.157 in or 11.34 points)
Right = 4.0 mm (0.157 in or 11.34 points)
Top = 4.0 mm (0.157 in or 11.34 points)
Bottom = 4.0 mm (0.157 in or 11.34 points)

For heavy paper (Postcard and Envelopes) the top margin is 6.00 mm.

Maximum printable line: 208 mm (8.19 in) standard mode

The default paper size is lettersmall.

Color LaserWriter 12/600: White Areas on Legal Documents (7/96)

Revised: 7/13/96
Security: Everyone

Color LaserWriter 12/600: White Areas on Legal Documents (7/96)

Article Created: 9 July 1996
Article Reviewed/Updated: 13 July 1996

TOPIC -----

Using a Color LaserWriter 12/600 PS, I am printing a color document on legal size paper. When the document prints, some areas of light color appear white, and some portions of the document disappear altogether. What could be causing this?

DISCUSSION -----

In the Color LaserWriter 12/600 PS, the Apple Contone Compression Technology is tuned to print a standard letter-size or A4 page using only 12 MB of RAM on the printer's I/O board. If you attempt to print a legal-size page on a Color LaserWriter 12/600 PS with 12 MB of RAM, some areas of light colors will appear white, and some portions of the document may disappear altogether. The name for this effect is "dropout".

Dropout occurs because the Apple Contone Compression Technology uses a higher compression technique which uses only the C,M, and Y color planes to fit a legal-sized image into the same amount of RAM as a letter-sized image.

To eliminate dropout, add more RAM to the printer's I/O board. Adding 4 MB of RAM (for a total of 16 MB) will allow legal-size pages to print without dropout.

Color LaserWriter 12/600: Error 0x3e7750 with AppleShare (1/97)

Revised: 1/24/97
Security: Everyone

Color LaserWriter 12/600: Error 0x3e7750 with AppleShare (1/97)

Article Created: 25 June 1996
Article Reviewed/Updated: 24 January 1997

TOPIC -----

When trying to capture a Color LaserWriter 12/600 PS printer with our AppleShare Print Server (v3.x or 4.x), the printer restarts and prints a page with the error, "Printer restarted due to error at address 0x3e7550." The printer was working properly with a LocalTalk connection.

I removed the logic board from the printer and let it sit for 10 minutes. Then I replaced the logic board into the printer and restored the printer defaults using the printer utility. This corrected the address problem, but is there any other way of correcting this?

DISCUSSION -----

When TCP/IP is turned off on the Color LaserWriter 12/600 PS or Color LaserWriter 12/660 PS with the Apple Printer Utility, this error occurs when any type of print server (AppleShare, NetWare, Windows NT) attempts to capture the printer by changing the AppleTalk type. You may also see one of the following errors: 0x3EA5B0 or 0x3E9428. You should turn TCP/IP on. The TCP/IP setting can be found under:

Apple Printer Utility
 Communication Configuration
 Port Configuration
 Ethernet Port

This explains why your workaround, of removing the logic board and letting it sit for 10 minutes resolves this issue. Basically, the board is reset to its default settings, where TCP/IP is on.

This issue has been reported, and Apple Engineering is investigating it. We have no information as to when a fix will be available.

Article Change History:

22 Jan 1997 - Added NetWare to the Article.

24 Oct 1996 - Added Color LaserWriter 12/660 and Windows NT information.

At Ease Updater (non-workgroups) 1.0 Read Me (6/96)

Revised: 6/26/96
Security: Everyone

At Ease Updater (non-workgroups) 1.0 Read Me (6/96)

=====

Article Created: 26 June 1996

TOPIC -----

The following article is the ReadMe document for the At Ease Updater (non-workgroups) 1.0.

DISCUSSION -----

This application is a utility that will modify the At Ease Startup system extension for At Ease 2.0 and 3.0, non-workgroup versions. Running this utility eliminates a potential startup hang problem with Mac-OS computers running Open Transport.

WARNING

This utility should be used only on a non-workgroup version of At Ease, (called "At Ease" rather than "At Ease for Workgroups"). If it is used on versions 2.0 or 3.0 of At Ease for Workgroups, network access problems may result and you will need to re-install At Ease for Workgroups on the computer. (Running the utility does nothing on versions 3.0.1 or later of At Ease for Workgroups.)

To use this utility, run it on a computer that has an installed version of At Ease 2.0 or 3.0 (non-workgroups).

If the update is successful, you should restart your machine. This utility will append a "+" character to the version string of the At Ease Startup extension file once it has been updated. You can use the Get Info command of the Finder if you want to know if the file has already been updated.

LaserWriter Toner Cartridges: Covered by Warranty? (7/96)

Revised: 7/16/96
Security: Everyone

LaserWriter Toner Cartridges: Covered by Warranty? (7/96)

=====

Article Created: 9 July 1996

TOPIC -----

Are Apple LaserWriter toner cartridges covered by any warranty?

DISCUSSION -----

As consumables, toner cartridges are not covered by Apple's warranty.

If the toner cartridge worked properly when first installed and developed image quality defects thereafter, the issues are usually caused by the media that was sent through the printer. To avoid potential issues with the toner cartridge, and use only approved paper types and weights for your printer. This information is available in your LaserWriter User's Guide, which was included with your LaserWriter.

Powerbook 500 Brightnss & Contrast Don't Work After Upgrd(10/96)

Revised: 10/8/96
Security: Everyone

Powerbook 500 Brightnss & Contrast Don't Work After Upgrd(10/96)

Article Created: 26 June 1996
Article Reviewed/Updated: 8 October 1996

TOPIC -----

After upgrading my Powerbook 500 series computer with the Power PC upgrade the brightness and contrast buttons no longer have any effect when it is starting up. This only happens when I start from the battery, not when it is plugged into the AC power.

DISCUSSION -----

Issue

=====

When using system software older than 7.5.5 on a Powerbook 500 series computer with the Power PC upgrade, the Display Brightness control push button does not work unless AC Power is connected.

If you adjust the brightness or contrast while the unit is starting up, and running from the battery, those controls will become locked in at the current brightness/contrast setting.

Workaround

=====

Do not adjust brightness or contrast until the unit fully comes up to the desktop. If you wait until the computer is finished starting up to make adjustments, the brightness and contrast buttons will work normally.

Resolution

=====

System Software 7.5.5

System Software 7.5.2 v 1.2 is the version of system software which originally shipped with the Powerbook 500 series computer Power PC upgrade. Installing System Software version 7.5.5 fixes display brightness issue.

Alternate Solution

Newer Technology has created a system extension that corrects this issue. It is called NUpowr Backlight Fix and can be found on the internet at www.newertech.com on the Free Software page.*

*NOTE:

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Newer Technology, for additional information.

PowerBook Duo: Difference In Volume Level After PPC Upgrd (6/96)

Revised: 6/27/96
Security: Everyone

PowerBook Duo: Difference In Volume Level After PPC Upgrd (6/96)

Article Created: 26 June 1996
Article Reviewed/Updated: 27 June 1996

TOPIC -----

I just had an authorized Apple service technician upgrade my PowerBook (Duo) 280c computer to the Power PC (PPC) 2300c logic board. Now my computer is much louder than it was before. Why? Can I reduce the volume to the way it was before the upgrade?

DISCUSSION -----

The sound output level on the PowerBook 2300c logic board is higher than on previous PowerBook 200 series (Duo) computers. The impedance on the PowerBook 270c and 280c computers' speakers is lower than on the speaker in the PowerBook 2300c. When you upgrade from a PowerBook 270c or 280c to the 2300c logic board, you may find that you PowerBook speaker is noticeably louder than it was before.

A PowerBook 270c or 280c computer which has been upgraded to the PPC logic board has the largest range in volume when compared to the PowerBook 200 or 2300 series computers. If it seems that your PPC upgraded PowerBook is too loud, it is possible that you have not adjusted the Sound control panel correctly. By adjusting the Volume and Alert Volume sliders in the Sound control panel, you should be able to match the overall volume level of your PowerBook computer before it was upgraded.

The following table shows the dB levels of the different PowerBook 200 and 2300 series computers using the Simple Beep sound in the Sound control panel. "Max" means the Volume and Alert Volume sliders were set to maximum. "Min" means the Volume and Alert Volume sliders were set to one. The dB meter was placed about one cm from the speaker.

Begin_Table

PowerBook 270c/280c upgraded

PowerBook 2300c	PowerBook 280c	to Power PC
-----	-----	-----
max - 110dB	max - 101dB	max - 116dB
min - 92dB	min - 85dB	min - 80dB

End_Table

This article was published in the Information Alley on 27 June 1996.

QuickTake 150 Camera: 2.0.1 Installer Read Me File (6/96)

Revised: 6/27/96
Security: Everyone

QuickTake 150 Camera: 2.0.1 Installer Read Me File (6/96)

=====

Article Created: 26 June 1996

TOPIC -----

The following is the Installer ReadMe file for the QuickTake software version 2.0.1 for use with the QuickTake 150 digital camera.

DISCUSSION -----

Installation process

The software for the QuickTake 150 digital camera is compressed onto four disks. The process of reading, decompressing, and installing the software can take a while on some Macintosh computers.

Warning about extensions

Some extensions interfere with the QuickTake Installer. To avoid problems, press and hold down the Shift key while you start up your Macintosh. This turns off the extensions temporarily. When QuickTake installation is complete and you restart your Macintosh, the extensions start up as usual.

System 7.5 and Virtual Memory

If you are using System 7.5 or greater with 8 MB of RAM on your Macintosh, it is recommended that you turn on your Virtual Memory from the Control Panel.

Installing on a hard disk that is not currently running your system

You can install this software onto any hard disk that has a System Folder. If the hard disk on which you install the QuickTake software is not the one that is running your system, you will have to select it as your startup disk before you can use your QuickTake camera. To do that, open the Startup Disk control panel and select the hard disk where you have installed the QuickTake software, then restart your computer.

Special Instructions for:

Macintosh IIfx, Quadra 900, and Quadra 950 computers

To use your QuickTake camera with a Macintosh IIfx, a Macintosh Quadra 900, or a Macintosh Quadra 950, the computer's serial switch must be set to "Compatible" rather than "Faster." To set the serial switch, use the Serial Switch control panel.

If you have an old version of Now Utilities installed

If you have a version of Now Software's Now Utilities that is previous to version number 5.0, some of the extensions installed with the QuickTake software may not be loaded. After installing the QuickTake software, open the Now Utilities Startup Manager control panel and make sure that AppleScript and Macintosh Drag and Drop are selected. You may want to upgrade to the latest version of Now Utilities.

If You Use Custom Remove

Custom Remove is designed to delete software that is not needed and leave any software that might be needed by other applications. If you use Custom Remove, you may see a dialog box when your Macintosh starts up telling you that Foreign File Access was not loaded because there is no software that uses it. If you get this message, remove Foreign File Access by dragging its icon from the Extensions folder to the Trash.

Now Utilities is a trademark of Now Software. This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Macintosh Tutorial: Read Me (6/96)

Revised: 6/28/96
Security: Everyone

Macintosh Tutorial: Read Me (6/96)

=====

Article Created: 28 June 1996

TOPIC -----

This article contains the ReadMe file for Macintosh Tutorial.

DISCUSSION -----

Macintosh Tutorial is a training program for new Macintosh users to learn how to use a Macintosh. It is the replacement for Macintosh Basics and requires System 7.5 and Apple Guide.

Installing and Configuring Macintosh Tutorial for 7.5
=====

Install Macintosh Tutorial following these steps:

- * Drag the Tutorial Items folder into the extensions folder of your 7.5 System Folder. (Do not rename the folder).
- * Drag the Macintosh Tutorial file into the extensions folder of your 7.5 System Folder. (Do not drag it into the Tutorial Items folder).
- * Restart your Macintosh.

To view the Tutorial, select Macintosh Tutorial from the Help menu.

Macintosh Tutorial is in two parts:

The first part teaches different pointing skills - mouse, trackball and trackpad - depending on the configuration that has been loaded in the Tutorial Items folder.

You can examine each pointing device path by moving the other pointing devices skills sections out of the Tutorial Items folder. For example, to show the Mouse Skills section, drag Trackpad Skill and Trackball skills out of the Tutorial Items folder. And if you'd like to view the Trackpad Skills, drag the other two out of the folder (replacing the Trackpad Skills section, of course) If you have a PowerBook Duo, leave both the Mouse and Trackball Skills sections in the

folder and when you're docked you will see Mouse Skills and undocked, Trackball Skills. If you leave all three Skills files in the folder, the tutorial will default to the Trackball Skills section.

The second part is an Apple Guide database and leads you through several tasks while you are in the Finder.

Network Assistant: Sys Information Report Maximum Width (7/96)

Revised: 7/11/96
Security: Everyone

Network Assistant: Sys Information Report Maximum Width (7/96)

Article Created: 28 June 1996
Article Reviewed/Updated: 11 July 1996

TOPIC -----

I am using Network Assistant to create a System Information report for the Macintosh computers on my network. I have a maximum of 630 pixels that can be used for the report. How can I efficiently predetermine the items I want to select for a report and stay within the 630 pixel maximum?

DISCUSSION -----

The maximum width of the System Information report is determined by the resolution of your monitor. When the screen resolution is 640 X 480 the maximum width of the report is 630 pixels. If the screen resolution is set to 1024 X 768 the maximum width of the report is 1,014 pixels.

The workstation is always the first field in the report. When you generate a new report, this field along with the report window require 167 pixels. When the monitor resolution is set to 640 x 480, you have 463 Pixels for the remaining fields.

Since you are not going to be able to get all the fields into one report, a good strategy would be to generate reports with like fields. Multiple reports can be left open for on screen viewing.

You can also print or export the report to a text file. If you want to know more about printing or exporting a report please refer to Part 3 in the Apple Network Administrator Toolkit manual page 55 "Printing and Exporting to a text file ".

The table below shows the number of pixels each field uses:

Begin_Table

System SW Version	75	Mouse Connected	75
Built-In Memory	65	Keyboard Connected	75

Apple Media Tool: Making a Compatible ISO 9600 Disc (6/96)

Revised: 7/11/96
Security: Everyone

Apple Media Tool: Making a Compatible ISO 9600 Disc (6/96)

Article Created: 1 July 1996

TOPIC -----

I am using the Apple Media Tool to create Microsoft Windows ISO-9660 formatted CD-ROM discs. However, when I use the media tool converters, I get an error message stating that some of my files have invalid ISO characters. What are the invalid ISO characters?

DISCUSSION -----

In order for your project to run correctly on an ISO 9660 formatted CD-ROM disc, you need to make sure you do the following:

- File names and extensions should be in all capitals.
- File name should not exceed eight characters, and extensions three characters.
- Numbers in file names should be separated from the alpha characters by an underscore. For example MOVIE_1.MOV

Characters Not Allowed include:

- Hypens
- Spaces
- Colons
- Slash
- Backslash

Network Administrator Toolkit: Default Password (7/96)

Revised: 7/15/96
Security: Everyone

Network Administrator Toolkit: Default Password (7/96)

=====

Article Created: 1 July 1996
Article Reviewed/Updated: 11 July 1996

TOPIC -----

I installed the Network Administrator Toolkit, and the first time I tried to launch Network Assistant Security and Network Assistant, each application asks for a password. What is the password?

DISCUSSION -----

The default password is "xyzzy" for both Network Assistant Security and Network Assistant. Apple Computer strongly recommends that you change these passwords in order to ensure complete security.

Color OneScanner 600/27: Troubleshooting error messages (7/96)

Revised: 7/3/96
Security: Everyone

Color OneScanner 600/27: Troubleshooting error messages (7/96)

=====

Article Created: 1 July 1996

TOPIC -----

When I open the Apple Color OneScanner 600/27 Dispatcher software, and click SCAN, an error appears on my screen. The error message states "A scanner error occurred. Please ensure that the scanner is turned on and the carriage is unlocked, then try again. If the feeder is attached, clear the paper jam by following the instructions in the User's Guide." What steps should I follow to correct this problem?

DISCUSSION -----

Here are the steps you should follow to troubleshoot your scanner.

Step 1

Verify that the Scanner extension loads properly.

If an 'X' appears on the scanner icon during startup of your Macintosh, then the Scanner extension did not load properly. The Tech Info Library article titled "Color OneScanner 600/27: ScannerDriver isn't Initializing" provides information on troubleshooting this problem.

Step 2

Verify that the scanner is turned on and the SCSI connections are secure. You should power on the scanner before powering on your Macintosh computer.

Step 3

Verify the proper SCSI ID and termination.

The red ID numbers on the right side of the dial are to be used when termination

is not provided externally--typically when the OneScanner is the only SCSI device. The Tech Info Library article "Apple Color OneScanner 600/27: Terminator isn't required" contains additional information on termination, and how to properly set it.

Note:

Sometimes it is difficult to determine visually which SCSI ID is selected. The Tech Info Library article titled "Color OneScanner 600/27: "SCSI Selector Has Wrong SCSI ID" contains additional information on how to determine the SCSI selection.

Step 4

Verify that the carriage, which is locked during shipment, is unlocked.

The Tech Info Library article "Color OneScanner 600/27: Chattering Sound due to Lock", and page 11 of the Apple OneScanner 600/27 User's Guide contains instructions for unlocking the Scanner.

Step 5

If you have a Feeder attached, check for paper jams. The Apple OneScanner 600/27 User's Guide contains instructions for doing this.

Step 6

Verify the cable on the back of the sheet feeder is securely connected to the serial port (DIN-8 connector) on the OneScanner.

Step 7

Try a different SCSI cable.

Having a faulty SCSI cable does not necessarily produce the same symptoms as having NO SCSI cable. So, the Scanner extension may load without having an 'X' on it when your Macintosh is starting up. When your SCSI cable is faulty, the software may load. However, when you do not have a SCSI cable attached, the Scanner Icon always has an 'X' through it at startup.

Step 8

Use standard software troubleshooting procedures in case the error message is itself erroneous.

Standard Software Troubleshooting Procedures

=====

Step 1

Scan with other applications (For example, TextBridge; Ofoto; or PhotoShop).

Step 2

Disable all non-essential extensions except for system software and the Scanner extension

Step 3

Reset the Parameter RAM (PRAM).

Step 4

Remove and reinstall the Scanner software.

Powerbook 5300 & 190 Series Repair Extension Program (7/96)

Revised: 7/3/96
Security: Everyone

Powerbook 5300 & 190 Series Repair Extension Program (7/96)

=====

Article Created: 2 July 1996

TOPIC -----

Apple Computer, Inc. has announced a Repair Extension Program for PowerBook 5300 and PowerBook 190 computers to address specific quality issues documented below. The program will remain in effect for seven years after manufacturing stops. The computer need not be showing any of the symptoms to be eligible for this program.

The following Program Notice applies to Apple Authorized Service Providers in the United States only.

DISCUSSION -----

MODELS INCLUDED

=====

Apple PowerBook 5300, 5300c, 5300ce, 5300cs
Apple PowerBook 190, 190cs

ISSUES ADDRESSED

=====

PowerBook 5300 and PowerBook 190

- The AC power connector on some systems can become loose or inoperative.
- The display bezel and housing on some systems can crack at the hinge.
- Some systems may freeze when accessing a device in the media bay while using certain PC cards that draw higher levels of power.

PowerBook 5300 only

- Some systems may take twice as long as normal to boot when plugged into AC power.
- Some computers on larger LocalTalk networks may experience devices

dropping off the network.

REPAIRS

=====

The Repair Extension Program includes some or all of the following, as appropriate, for a particular PowerBook 5300 and/or PowerBook 190 system:

- As appropriate, update the logic board to include engineering changes implemented as of April 22, 1996.
- As appropriate, replace display housing to correct cracks in plastic.
- As appropriate, add shielding to improve boot time while connected to AC power.

How to tell if your PowerBook needs the update or has been updated

Any PowerBook 5300 or 190 computer that was in Apple finished goods inventory as of mid-April, 1996 has been updated. These updated computers, and all future 5300 and 190 series computers, can be identified by a "/B" in the finished goods part number and having the letters "AA" appended to the bottom right corner of the serial number label on the PowerBook itself.

After completion of the specific updates mentioned in this Program Notice, a similar sticker will be applied by Apple or an Apple Authorized Service Provider indicating the PowerBook has received the updates associated with this program.

Where to get the repair and how to arrange for it

In the United States, repairs will only be performed at Apple's central repair facility through late summer 1996 due to parts constraints.

To arrange for service related to this program, call 1-800-801-6024 after June 24, 1996. Due to parts constraints, Apple may schedule repair center dispatches out into the future.

By late summer 1996, we expect to have sufficient parts inventory for your local Apple Authorized Service Provider (AASP) to perform the repairs.

IMPORTANT NOTES

=====

Unrelated issues not covered

It is possible some customers may experience issues with PowerBook 5300 or PowerBook 190 computers that may be unrelated to the issues and repairs described above. Any such issues would not be covered by this Repair Extension Program.

System software version will be updated

Apple will update system software on PowerBook 5300 and 190 series computers

that are sent in for the repair program to Mac OS version 7.5.2 with Enabler 1.2.1 if they are running an earlier version. Apple believes this update will enhance the performance and reliability of your PowerBook computer.

PowerBook 5300 & 190 Series Repair Extension Program Q&A (7/96)

=====

Article Created: 2 July 1996
Article Reviewed/Updated: 3 July 1996

TOPIC -----

This article contains Frequently Asked Questions (FAQ) and Answers concerning the PowerBook 190 and 5300 series Repair Extension Program.

The following questions are answered in this article:

- 1) What is a Repair Extension Program?
- 2) Which PowerBook models are included in this Repair Extension Program?
- 3) Is this repair program different from the product recall I heard about recently?
- 4) Are other computers (Performas, Power Macs) included in this program?
- 5) What is the Repair Extension Program for the Apple PowerBook 5300 and 190 computers?
- 6) What are the details of the repair?
- 7) How is Apple notifying customers who may be affected by these quality issues?
- 8) What is the turnaround time on getting my PowerBook repaired?
- 9) If I have to send my PowerBook in to get fixed, is there a chance that I will lose my data, either in the repair or OS upgrade?
- 10) I have already called 1-800-SOS-APPL about getting my computer system repaired under this program. Do I need to call Apple again?
- 11) Are there any known safety issues with these products?

12) Is there a cost to customers to participate in this program?

13) Are these worldwide programs?

14) What if my computer exhibits problems not caused by the components that Apple has identified?

15) Is Apple extending the warranty on my computer?

DISCUSSION -----

1) Question: What is a Repair Extension Program?

Answer: A repair Extension Program is one mechanism Apple uses to correct specific known quality issues exhibited during or after the warranty period. Quality is a top priority at Apple, and this repair program addresses certain specific quality issues that have surfaced with these products. Apple is implementing this repair program as part of the company's goal to provide a high level of customer satisfaction to its customers.

2) Question: Which PowerBook models are included in this Repair Extension Program?

Answer: The models included in this program are Apple PowerBook 5300, 5300c, 5300ce, 5300cs, 190, 190cs.

3) Question: Is this repair program different from the product recall I heard about recently?

Answer: This is the same program. In early May, we alerted Apple resellers about these Repair Extension Programs so that they would have time to prepare for customer calls and questions. Our communications to our resellers received widespread media coverage, which characterized these programs as a recall. But it's the same program; we are in the process now of letting customers know that we're ready to begin repairing affected PowerBook computers. This is a repair extension program, not a product recall.

4) Question: Are other computers (Performas, Power Macs) included in this program?

Answer: We are activating the PowerBook 5300/190 Repair Extension Program this week. In early June, we launched a separate Repair Extension Program for certain Performa and Power Macintosh computers.

5) Question: What is the Repair Extension Program for the Apple PowerBook 5300 and 190 computers?

Answer: The Repair Extension Program for the Apple PowerBook 5300 and PowerBook

190 computers addresses the following potential quality issues:

PowerBook 5300 and PowerBook 190

- * The AC power connector on some systems can become loose or inoperative.
- * The display bezel and housing on some systems can crack at the hinge.
- * Some systems may exhibit problems when accessing a device in the media bay while using certain PC cards that draw higher levels of power.

PowerBook 5300 only

- * Some systems may take twice as long as normal to boot when plugged into AC power.
- * Some computers on larger LocalTalk networks may experience devices dropping off the network.

With this Repair Extension Program, Apple has identified known hardware issues the company will repair * at its cost * for as long as Apple services these products. In the United States, that is seven years after the company stops manufacturing the products. In other countries, the time period is different.

6) Question: What are the details of the repair?

Answer: The following issues will be addressed by this program:

PowerBook 5300 and PowerBook 190 computers

Symptom: The AC power connector on the logic board can become loose or inoperative.

Affected serial numbers: xx605xxxxx and below

Solution: Replace logic board.

Symptom: Using a device in the media bay in combination with certain PC cards that draw higher levels of power can cause the system to freeze at the time the devices are used. When the computer experiences a freeze, you are able to move the pointer on screen, but clicking the mouse button has no effect.

Affected serial numbers: xx605xxxxx and below

Solution: Replace logic board.

Symptom: The display bezel and housing can crack and separate at the hinge.

Affected serial numbers: xx622xxxxx and below.

Solution: Replace display bezel, housing, and screws.

PowerBook 5300 Only

Symptom: Some computers may take twice as long to boot when plugged into AC power as compared to booting from battery only.

Affected serial numbers: xx605xxxxx and below

Solution: Install the power supply shield.

Symptom: Some computers on larger LocalTalk networks may experience devices dropping off the network.

Affected serial numbers: xx622xxxxx and below
Solution: Replace the logic board

7) Question: How is Apple notifying customers who may be affected by these quality issues?

Answer: Many customers heard about this program through media coverage and have already contacted Apple. Apple has begun to contact these customers through phone calls or letters to provide specific details on program participation and/or to schedule a repair. In addition, customers who have mailed in their product registration cards will receive a letter from Apple. Information on the Repair Extension Program is also available on Apple's Web site:
www.info.apple.com.

8) Question: What is the turnaround time on getting my PowerBook repaired?

Answer: It's important to note that because of constrained parts availability, scheduling repairs may be delayed by several weeks. That means that we may have to schedule pickup of a customer's PowerBook several weeks in advance. Once we have picked up a customer's PowerBook, it will take only 5 to 7 days to repair and return the system. For this reason, we are requesting PowerBook customers to wait a couple weeks to schedule a repair if their computer is functioning adequately.

9) Question: If I have to send my PowerBook in to get fixed, is there a chance that I will lose my data, either in the repair or OS upgrade?

Answer: Apple recommends that you backup your hard disk before sending your system in. Under usual circumstances, there should be no problem with the information stored on your PowerBook. But be sure to back up your hard disk before sending your PowerBook in for repair.

10) Question: I have already called 1-800-SOS-APPL about getting my computer system repaired under this program. Do I need to call Apple again?

Answer: No. Apple will be contacting (via phone and/or letter) all customers who have previously expressed interest in participating in this program.

11) Question: Are there any known safety issues with these products?

Answer: No.

12) Question: Is there a cost to customers to participate in this program?

Answer: The specific repairs outlined in this program will be at Apple's cost.

13) Question: Are these worldwide programs?

Answer: These are worldwide programs, but it is important to note that these identified quality issues and their solutions may differ country to country.

14) Question: What if my computer exhibits problems not caused by the components that Apple has identified?

Answer: If a customer is experiencing an issue that has not been identified by Apple as part of this program, the service provider or Apple phone-support representative (1-800-SOS-APPL) will work with the customer to determine an appropriate course of action.

15) Question: Is Apple extending the warranty on my computer?

Answer: Under this Repair Extension Program, Apple, at its option, will repair or replace the specific components the company has identified. This program does not extend the repair of any other systems, parts, or components beyond the warranty period.

Apple Remote Access Client and Internet Access (1/97)

Revised: 1/25/97
Security: Everyone

Apple Remote Access Client and Internet Access (1/97)

=====

Article Created: 2 July 1996
Article Reviewed/Updated: 25 January 1997

TOPIC -----

My computer at work has access the Internet through an Ethernet LAN. Can I call into my computer with Apple Remote Access (ARA) and get on the Internet?

DISCUSSION -----

Yes, you can access the Internet with ARA. Here is a brief explanation of how it can be done.

ARA uses the AppleTalk protocol to communicate with other network resources like file servers, printers, and so on. To obtain Internet access, which uses the TCP/IP protocol, you will need to have a DDP/IP (Datagram Delivery Protocol/Internet Protocol) gateway, for example the Apple IP Gateway, somewhere on your Ethernet LAN.

A DDP/IP gateway is a node that sits on both an AppleTalk and an IP network and translates packets between them. The basic purpose of the DDP/IP gateway is to let Macintosh clients on an AppleTalk only network, like ARA, have access to TCP/IP hosts on an IP network.

NOTE: To connect to the internet, your ARA client computer must have either MacTCP if you are using the Classic AppleTalk networking, or TCP/IP if you are using Open Transport.

PowerBook 5300 & 190 Repair Extension Customer Letter (7/96)

Revised: 7/2/96
Security: Everyone

PowerBook 5300 & 190 Repair Extension Customer Letter (7/96)

=====

Article Created: 2 July 1996

TOPIC -----

The following article contains the letter that was sent out by Apple to owners of Macintosh PowerBook 190 or 5300 series computers.

DISCUSSION -----

An Important Apple Service Notification

Dear Valued Apple Customer,

Apple is committed to providing very high-quality products to our customers. Our commitment to quality is essential for maintaining the loyalty of valued customers like you. Please review this notice concerning quality issues with some PowerBook 5300 and PowerBook 190 models.

The Apple PowerBook Repair Extension Program

(Models 5300, 5300c, 5300ce, and 5300cs; 190 and 190cs)

Apple has identified certain quality issues with PowerBook 5300 and PowerBook 190 computers about which we wish to inform you. Apple has instituted a Repair Extension Program. Under the Repair Extension Program, Apple or an Apple Authorized Service Provider will inspect and, if appropriate, repair any of the specific issues Apple has identified. This will be done at no expense to you for as long as Apple services these products, which in the United States is seven years after we stop manufacturing the product.

Repair Extension Program Quality Issues

To determine whether your PowerBook computer may be affected, please review these questions:

PowerBook 5300 and PowerBook 190 computers:

- Is the plastic housing that holds your video display starting to separate at the seams, most likely in the lower left or lower right corners?
- Is the AC power connector on your PowerBook computer loose or inoperative?
- While using PC cards that may draw higher levels of power, does your system seem to "hang" so that the cursor moves but the mouse button has no effect?

PowerBook 5300 computers only:

- Does your PowerBook computer take almost twice as long to boot when plugged into AC power than when running off the battery alone?
- When connected to large LocalTalk networks does your PowerBook drop off the network?

If any of these conditions apply to your system, Apple encourages you to participate in the Repair Extension Program. If there is an "AA" in the lower right corner of the serial number label on the underside of your PowerBook, you should not be experiencing the issues described in this specific Repair Extension Program.

Repair Process

All you need to do is call 1-800-801-6024. An Apple customer service representative will work with you to schedule an inspection and, if needed, repair for your system. Apple will send you a freight-paid shipping box for your PowerBook computer and inform you of the pick-up time and expected return date. (We will be shipping your PowerBook computer via next-day air to minimize the amount of time you will be without your computer.) Before shipping your PowerBook computer to the Repair Extension Program center, please remember to back up all data on your hard disk drive.

Because of repair center capacity, Apple may be required to schedule repairs several weeks in advance. If your system is functioning adequately, you may wish to wait a few weeks before calling to schedule a repair. The 1 800-801-6024 number provides information on how far in advance we are currently scheduling repairs.

If you believe you are experiencing problems with your PowerBook computer that are unrelated to this special program, please call 1 800-SOS-APPL for assistance.

NOTE: Mac OS UPDATE

If your PowerBook computer is running an earlier version of Mac OS, Apple will automatically update your system software to Mac OS 7.5.2 with Enabler 1.2.1. We believe this update will enhance the performance and reliability of your PowerBook computer.

We regret any inconvenience these quality issues may have caused you and we are dedicated to getting your PowerBook computer repaired and returned to you as quickly as possible.

Thank you for your patience.

Sincerely,

Jackie Whiting
Vice President, Apple Customer Service
Apple Computer, Inc.

LaserWriter Bridge and Setting Ethernet Zone (7/96)

Revised: 7/2/96
Security: Everyone

LaserWriter Bridge and Setting Ethernet Zone (7/96)

=====

Article Created: 2 July 1996

TOPIC -----

How do I change the Ethernet zone my LaserWriter Select 360 is in when using Apple's LaserWriter Bridge? When I use the LaserWriter Utility to change zones, the configuration reads "LocalTalk", and if I use the Apple Printer Utility, the configuration reads "Fixed Settings".

DISCUSSION -----

A LaserWriter Select 360 will appear in the same Ethernet zone as the computer to which it is attached, in other words, only one zone can be assigned to a LocalTalk device. The LaserWriter Bridge software will register LocalTalk devices on the default zone of the EtherTalk segment the bridge device is attached to.

To our knowledge, there is no "printer bridge" hardware or software which lets you register a LocalTalk device on a different zone of an EtherTalk segment. If you desire this level of functionality, you may wish to investigate obtaining a router.

Apple's LaserWriter Bridge shipped with the LaserWriter Select 360 and LaserWriter 4/600 PS printers. The LaserWriter Bridge is available on-line from Apple's software updates locations with the Network Software Installer.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Apple Network Administrator Toolkit & AWS 95 (7/96)

=====

Article Created: 3 July 1996
Article Reviewed/Updated: 13 July 1996

TOPIC -----

Will the At Ease for Workgroups 4.0 package of the Apple Network Administrator Toolkit work on the Apple Workgroup Server (AWS) 95?

DISCUSSION -----

No, the At Ease for Workgroups 4.0 package of the Apple Network Administrator Toolkit is only supported on a Mac OS-based computer that functions as an AppleShare file server.

The At Ease for Workgroups 4.0 package will not work on an A/UX system such as the Workgroup Server 95. It will not work on Windows NT, NetWare or any other AFP compliant server. However, these AFP compliant servers may be used as Document Servers for At Ease for Workgroups.

AICK 1.1: Apple Internet Dialer Configuration Q&A (7/96)

Revised: 7/15/96
Security: Everyone

AICK 1.1: Apple Internet Dialer Configuration Q&A (7/96)

=====

Article Created: 15 July 1996

TOPIC -----

This article is the Apple Internet Connection Kit (AICK) 1.1 Apple Internet Dialer Configuration Q&A.

DISCUSSION -----

Apple Internet Dialer

Question: What is the Apple Internet Dialer?

Answer: The Apple Internet Dialer is an application that uses a suite of helper applications and extensions to enable the user to go online with minimum set-up time or technical knowledge.

Question: What information do AICK users need in order to use the Apple Internet Connection Kit successfully?

Answer: The AICK user will need the following information from the Internet Service Provider (ISP). This information is entered in three different screens within the Apple Internet Dialer. The screens are labeled "Service Provider Account Information", "Server Information", and "Connection Script". In order, the screens require:

"Service Provider Account Information":

- The ISP's name
- The AICK user's login name
- The AICK user's password
- The ISP's modem pool phone number
- The AICK user's e-mail password (if different from their login password)

"Server Information":

- The ISP's NNTP host address

- The ISP's SMTP host address
- The ISP's POP server address
- The AICK user's e-mail address
- The ISP's Domain name
- The ISP's primary DNS address
- The ISP's alternate DNS address

"Connection Script":

The AICK user will not need to enter anything in here if the ISP's service is PAP enabled and compliant. If the ISP's service does require a connection script that is less than eight lines long, the AICK user needs to have the remaining empty lines set to "Wait For" to prevent spurious returns from being sent. There is no facility within the Apple Internet Dialer for entering connection scripts longer than eight lines.

Question: Is there anything else that the ISP needs to know about the requirements for the Apple Internet Dialer?

Answer: Only that the AICK was designed to work with a Dynamic Addressing System as opposed to a Static IP system. If the ISP's system is Static IP only, please contact the Apple Assistance Center's Apple Internet Connection Kit support group at 800-767-2775 for further information.

Question: Do AICK users need to enter data into the ConfigPPP Control Panel?

Answer: No. The Apple Internet Dialer is designed to automatically enter the connection information for the AICK user into the PPP Extension preferences. Also note that with AICK 1.1.x the PPP Extension has been upgraded to version 2.5

Question: Do AICK users need to enter data into the MacTCP or TCP/IP Control Panel?

Answer: No. The Dialer is designed to automatically enter the configuration information into the MacTCP or TCP/IP Control Panel's preferences. Simply fill out the information in the Apple Internet Dialer, and it will atomically configure the MacTCP or TCP/IP Control Panel.

Internet Status

Question: What is the Internet Status application?

Answer: Internet Status is an application that is launched after the Apple Internet Dialer establishes a connection with the ISP. Internet Status is used to hang up after a session complete and can also be used dial a connection after the Apple Internet Dialer has been configured correctly.

Modem configuration

Question: The AICK user's modem does not show up in the modem selections listed in the Apple Internet Dialer. Can the AICK user setup in their own modem description?

Answer: Yes, they can enter the modem information by scrolling all the way to the top of the modem listing to the "Add/Modify modem" selection.

Question: What information does the AICK user need to enter in the Add/Modify modem selection?

Answer: They will need an initialization string for a PPP connection on a Macintosh. They will also need the flow control settings and the preferred modem speed. All of this information they will need to get from the modem manufacturer.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

AICK 1.1: Modem Initialization String Q&A (7/96)

Revised: 7/15/96
Security: Everyone

AICK 1.1: Modem Initialization String Q&A (7/96)

=====

Article Created: 15 July 1996

TOPIC -----

This article is the Apple Internet Connection Kit (AICK) 1.1 Modem Initialization String Q&A.

DISCUSSION -----

Question: What is a modem initialization string?

Answer: A modem initialization string is used to set up your modem to properly communicate with another modem.

Question: Where do you change a modem string in the Apple Internet Dialer?

Answer: Click on the modem pop up menu in the front screen of the Apple Internet Dialer. Then scroll to the top of the list until you see the screen that says add/modify modem. The screen will then change to Modem Options screen and you will be asked to name the modem. Name it "My (modem type) Modem". After you've named your new modem, hit the tab key and the cursor will move down to the field labeled "init string:". Type in the init string you desire to enter. Then select the flow control pop-out menu and set the flow control, then enter the recommended modem speed.

Question: What do I try if it doesn't work with this method?

Answer: You can get a new init string from the following sources:

- The manufacturer of your modem
- The support center for the product you are using
- The Internet service provider
- Your manual that came with your modem

Question: What do I ask for when asking about an init string for my modem?

Answer: If asking for an init string, then it would be helpful if you could ask the following question of your modem manufacturer:

- 1) Could you please give me two init strings you would recommend for making a PPP connection to the Internet on a Macintosh computer?
- 2) I would also like to know what hardware flow control settings you recommend for this modem, and what should I set my modem port speed at in my application?
- 3) Are there any hardware or software upgrades for this modem I need to be aware of? If yes, then how do I get them?

AICK 1.1: Q&A For Internet Service Providers (7/96)

Revised: 7/15/96
Security: Everyone

AICK 1.1: Q&A For Internet Service Providers (7/96)

Article Created: 15 July 1996

TOPIC -----

This article is the Apple Internet Connection Kit (AICK) 1.1 Q&A For Internet Service Providers (ISP).

DISCUSSION -----

Question: What is the Apple Internet Connection Kit?

Answer: The Apple Internet Connection Kit is a collection of commercial and shareware programs compiled into a complete and easy to use package.

Question: What is included in the AICK?

Answer: The major parts of the package include the Apple Internet Dialer, Netscape, Claris EMailer Lite, Fetch, Gopher and Telnet. These programs are linked behind the scenes by the Internet Config application. Also included are a number of common utilities as well as Netscape helper applications.

Question: How do I configure the Apple Internet Connection Kit for my clients who are dialing in to my server using the AICK?

Answer: Configuration that normally takes place in ConfigPPP, MacTCP (or TCP/IP) now takes place entirely in the Apple Internet Dialer. When first launched, the Apple Internet Dialer is ready to connect to a "Registration Server". This server advertises a number of national Internet Service Providers for AICK owners to use if they desire. To configure the AICK to work with an Internet Service Provider not on this Registration Server, the user must select "Define Provider Information" from the "Provider" menu of the Apple Internet Dialer.

This action opens up the first of a number of screens prompting the user for his or her Internet Service Provider's connection information. The first screen is

just an instruction screen.

When the user clicks the "Next" button, a Service Provider Account Information screen appears prompting the user to enter the provider name and phone number along with the user's login name and passwords.

The following Server Information screen prompts the user for server addresses. Each of these items must be filled out in full.

The final Connect Script screen prompts the user for a connection script. This screen only needs to be used if your server requires a connection script, otherwise PAP and CHAP protocol calls are active in the kit and will establish the connection. In this screen, the "send" buttons may be pulled down to select "wait for." It is also noteworthy that a "send" line in the script is automatically followed by a carriage return. Once each of these screens is filled out, the user is brought back to the main screen of the Apple Internet Dialer.

From the main screen of the Apple Internet Dialer, the user may select the proper modem from an extensive Modem pop-up list. If the modem is not on the list, the user may select "Generic High Speed," or "Default Modem," or "Add/Modify Modem." The "Add/Modify" selection (found at the very top of the list) brings up a dialog box prompting the user for the modem name, init string, flow control and port speed.

When all is configured, the user needs to press the "Dial" button to dial out and connect to the Internet Service Provider.

If modifications need to be made to the provider file, the user must pull down the Provider menu and select "Modify Current Provider."

NOTE: The Apple Internet Dialer was designed to work with dynamically addressed servers. If your server is not dynamically addressed, the Apple Internet Dialer will not work correctly and the user may need to continue using ConfigPPP to connect.

Question: Why does the connection drop the line at the "Establishing communications phase"

Answer: This usually signals the need for a connection script.

Fax Terminal Will Not Launch with Type 1 Error (12/96)

Revised: 12/3/96
Security: Everyone

Fax Terminal Will Not Launch with Type 1 Error (12/96)

=====

Article Created: 3 July 1996
Article Reviewed/Update: 3 December 1996

TOPIC -----

When I launch Fax Terminal, my computer crashes with a Type 1 error, and I cannot receive faxes, the modem never answers on the incoming calls. I am able to send faxes by selecting Fax Sender from the Chooser, and printing from within applications.

I have already re-installed the Telecom software, reset PRAM, thrown away all of the associated preference files, thrown away and re-installed the Fax Terminal software.

DISCUSSION -----

Here are some troubleshooting tips to try:

- There is an issue with the Fax Terminal quitting with a Type 1 error when using System 7.5 Update 2.0 and Apple Guide 2.0.2. Allegedly, Apple Guide 2.0.2 can be installed on a computer with System 7.1 which may be distributed with some software packages like Newton Press and Quicken. Also, the Apple Internet Connection Kit (AICK) 1.1.1 comes with Apple Guide 2.0.2. If the user has this extension installed, try removing it from the Extensions folder.
 - If the above is not affecting the users computer, try performing a clean system installation since the user has already threw away the preferences files. We have find corrupt preference files may also cause this.
 - Try removing previously sent or received faxes from the folder. A corrupted file in the files sent or received folders may be causing this.
 - Try using only Apple extensions in the Extensions Manager control panel.
- NOTE: Were any software or hardware changes made just before the issue started.

PC Exchange: Max of All Partition Names is 32 Characters (7/96)

=====

Article Created: 8 July 1996

TOPIC -----

I partitioned my hard drive, and now when I open PC Exchange and select the Option button, a system error occurs. What is wrong?

DISCUSSION -----

If the number of characters in the names of all the partitions is greater than 32, PC Exchange will crash when the Option button is selected.

The workaround is to either use fewer partitions or rename the partitions with smaller names.

This issue will be corrected in a future version of PC Exchange.

LW 16/600 PS: Setting Subnet Mask & Gateway Remotely (7/96)

Revised: 7/8/96
Security: Everyone

LW 16/600 PS: Setting Subnet Mask & Gateway Remotely (7/96)

Article Created: 2 July 1996

TOPIC -----

I have a LaserWriter 16/600 PS Printer. I can configure the IP address using the Apple Printer Utility, but not the subnet mask or gateway.

This means that if I am on another part of my TCP/IP intranet, I can configure the IP address using AppleTalk, but cannot complete the configuration unless I telnet from a computer that is physically on the local TCP/IP subnet.

Is there any way I can complete this configuration without having to go on site to each printer?

DISCUSSION -----

The LaserWriter 16/600 PS subnet mask and gateway are Configurable only using the telnet facility. Newer versions of Apple Printer Utility support configuration of these values in the Apple Color LaserWriter 12/600 PS and LaserWriter 12/640 PS printers. However, with the LaserWriter 16/600 PS printer, you can configure only the IP address.

If you have a UNIX workstation in the local IP subnet or the local router supports telnet, you can use a two-step process to remotely configure the printer.

Step 1

Configure TCP/IP using AppleTalk

Use any version of Apple Printer Utility to set the IP address, and restart the printer.

At this point, the printer can accept telnet connections from local hosts only.

Step 2

Configure subnet mask and gateway address

Telnet to a UNIX workstation or router. Telnet back out from the UNIX workstation or router to the printer. The second telnet session goes from the local device to the LaserWriter 16/600 PS printer, so it should be accepted.

Configure the subnet mask and gateway address as described in the LaserWriter 16/600 PS User's Guide.

PC Compatibility Card: MS Office Pro 95 CD (7/96)

Revised: 7/9/96
Security: Everyone

PC Compatibility Card: MS Office Pro 95 CD (7/96)

=====

Article Created: 9 July 1996

TOPIC -----

When I insert the Microsoft Office 95 Professional Edition CD-ROM in the CD-ROM drive, I get an error that says, "The disk <volume name> cannot be used, because it cannot be found." However, other CD-ROMs can be read fine, including the Microsoft Office 95 Standard Edition. What's wrong?

DISCUSSION -----

This CD-ROM disc cannot be mounted on the Macintosh desktop. It is not designed for use in the Macintosh environment. However, if you have a PC Compatibility Card, this CD-ROM is readable in the PC environment. You will have to switch to the PC environment to use this CD-ROM disc.

PowerBook Duo Computers: Battery Reconditioner Compat (7/96)

Revised: 7/11/96
Security: Everyone

PowerBook Duo Computers: Battery Reconditioner Compat (7/96)

=====

Article Created: 9 July 1996

TOPIC -----

I am trying to use the battery reconditioner utility for the PowerBook Duo and I get the message:

"There is something wrong with the application file. Please replace it from the original disk."

DISCUSSION -----

There are two versions of the Battery Reconditioner program, 1.1 and 1.3. To use the Battery Reconditioner program on a PowerBook (Duo) 2300c you must have version 1.3. This version came pre-installed in the Utilities folder on PowerBook Duo 2300c computers. Version 1.3 is backward compatible with previous PowerBook Duo computers, thus it can be used on any PowerBook (Duo) computer even though it was specifically created for the PowerBook 2300c.

Battery Reconditioner version 1.1 shipped with the PowerBook (Duo) 280c and is backward compatible with PowerBook (Duo) computers that were released before the 280c (210, 230, 270c). It is not compatible with the PowerBook 2300c or any PowerBook Duo computer that has been upgraded with a Power PC logic board.

Macintosh Performa 6400/180 & 6400/200: Description (9/96)

=====

Article Created: 9 July 1996
Article Reviewed/Updated: 19 September 1996

TOPIC -----

This article contains a description of the Macintosh Performa 6400/180 and 6400/200 computers.

DISCUSSION -----

The Apple Macintosh Performa 6400/180 and 6400/200 computers are two of the most powerful, expandable, and easy-to-use multimedia computers you can get for your home. Continuing Apple's multimedia leadership, their robust features and high-quality pre-installed software make them an ideal system on which your whole family can learn, create, and communicate.

A state-of-the-art RISC-based PowerPC 603e processor running at up to 180 or 200 megahertz delivers the performance you need to run an abundance of powerful multimedia applications.

The Performa 6400/180 and 6400/200 computers also include a host of features. A built-in 8x-speed CD-ROM drive delivers smooth video and audio. A 64-bit video architecture and 1 megabyte of video memory provide high-quality video and realistic graphics on monitors up to 17 inches (diagonal measurement) in size. The systems also feature 16-bit CD-quality stereo input and output, SRS surround sound, and a subwoofer speaker--a combination that will add a whole new audio dimension to your multimedia experience.

With 16 megabytes of RAM (expandable to 136 megabytes), the Macintosh Performa 6400/180 and 6400/200 have the memory to run powerful multimedia applications. And their 1.6 gigabyte and 2.4 gigabyte hard drives give you all the storage you'll need for a long time to come.

For connecting to the Internet, the Performa 6400/180 and 6400/200 offer easy access either through America Online (in the United States) or directly through the Apple Internet Connection Kit, which features Netscape Navigator software.

And with the built-in 28.8-kilobit-per-second modem*, exchanging e-mail and browsing the World Wide Web can be fast.

If you need compatibility with MS-DOS or Windows software-based computers, the Performa 6400/180 and 6400/200 systems give you several choices. You can share floppy disks and files by using Macintosh PC Exchange and Macintosh Easy Open software (both included). SoftWindows from Insignia Solutions (available separately) lets you run Windows applications right on your Performa system. For the ultimate in compatibility, Apple's optional PC Compatibility Card puts a 100-mega-hertz 586-class processor right in your computer.

The Macintosh Performa 6400/180 and 6400/200 computers: High-performance multimedia for your home.

* Fax speeds up to 14.4 Kbit/s, data speeds up to 28.8 Kbit/s

Features

=====

High performance

- * 180-MHz PowerPC 603e processor (Macintosh Performa 6400/180)
- * 200-MHz PowerPC 603e processor (Macintosh Performa 6400/200)
- * Internal fax modem supports speeds up to 28.8-Kbit/s data and 14.4-Kbit/s electronic fax send/receive as well as speakerphone and digital answering machine capabilities
- * Built-in 8x-speed, tray-loading CD-ROM drive

Rich multimedia

- * Support for up to 32,768 colors and moni-tors up to 17 inches (diagonal measurement)
- * 16-bit CD-quality stereo sound with SRS surround sound and integrated subwoofer

Expandability and flexibility

- * Two industry-standard PCI expansion slots for 6.88-inch cards
- * Support for up to five external SCSI devices, such as hard disk drives and scanners
- * SCSI expansion bay for additional internal storage device
- * Optional Apple TV/FM Radio System, Avid Cinema, and PC Compatibility Card

Ease of use

- * Macintosh System 7.5 software, including Apple Guide software for step-by-step help with basic system operation
- * Apple Internet Connection Kit software for quick, easy access to global resources, including the World Wide Web
- * Plug-and-play installation of expansion cards, storage devices, scanners, printers, digital cameras, and other accessories

Preinstalled software

=====

- * Macintosh System 7.5
- * ClarisWorks
- * Apple Internet Connection Kit
- * America Online
- * Adobe Photo Deluxe
- * Web Workshop
- * At Ease
- * MacLinkPlus and Easy Open Translators
- * Quicken Special Edition
- * MegaPhone for Performa
- * NOW TouchBase and DateBook Pro
- * The American Heritage Dictionary
- * Click Art Performa Collection
- * MacGALLERY Clip Art Treasure Pak
- * SurfWatch
- * DOGZ Adoption Kit

CD-ROM titles

=====

- * Descent
- * The Grolier Multimedia Encyclopedia
- * Our Times
- * 3D Atlas
- * Mayo Clinic Family Health
- * Amazing Writing Machine
- * The American Heritage Children's Dictionary
- * Club KidSoft CD
- * Blockbuster Guide to Movies and Videos
- * Thinkin' Things Collection 2

Software titles may vary and may be modified versions of commercially available products.

Ordering Information

=====

Macintosh Performa 6400/180

Order No. M5167LL/A

Computer with 180-MHz PowerPC 603e processor, 28.8-Kbit/s modem, 1.6 GB hard disk drive, 8x-speed CD-ROM drive, and 1.4 MB floppy disk drive. Mouse, keyboard, and cables also included.

Macintosh Performa 6400/200

Order No. M5168LL/A

Computer with 200-MHz PowerPC 603e processor, 28.8-Kbit/s modem, 2.4 GB hard disk drive, 8x-speed CD-ROM drive, and 1.4 MB floppy disk drive. Mouse, keyboard, and cables also included.

Optional Enhancements

* High Performance Module

(256K level 2 cache)

Order No. M4505LL/A

(Note: The 256K Level 2 cache is included with the Macintosh Performa 6400/200, but is available as a separate enhancement for the Macintosh Performa 6400/180.)

* Apple Video System

Order No. M2894LL/D

* Apple TV/FM Radio System

Order No. M4586LL/A

(Requires the Apple Video System)

* Apple Presentation System

Order No. M2895LL/A

* PC Compatibility Card

(with 586-class processor)

Order No. M4091LL/C

* Avid Cinema

Order No. M4561LL/A

(Requires the Apple Video System)

Part numbers and specifications mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Macintosh Performa 6400/180 & 6400/200: Specifications (11/96)

=====

Article Created: 9 July 1996
Article Reviewed/Updated: 15 November 1996

TOPIC -----

This article contains the technical specifications for the Macintosh Performa 6400/180 and 6400/200 computers.

DISCUSSION -----

Microprocessor

=====

- * PowerPC 603e processor running at 180 MHz (Macintosh Performa 6400/180)
- * PowerPC 603e processor running at 200 MHz (Macintosh Performa 6400/200)
- * Integrated floating-point unit
- * 40-MHz, 64-bit bus
- * 32K internal cache
- * 256K level 2 cache (included with Macintosh Performa 6400/200; optional enhancement available separately for use with the Macintosh Performa 6400/180)

Memory

=====

- * Two DIMM expansion slots
- * Comes with 16 MB of RAM (8 MB on logic board and 8 MB in one DIMM socket)
- * Can be expanded to 136 MB
- * Uses 64-bit-wide, 168-pin, noncomposite, 70-nanosecond or faster DIMMs (1K or 2K refresh)

Disk drives

=====

- * Internal 1.6 GB IDE hard disk drive (Macintosh Performa 6400/180)
- * Internal 2.4 GB IDE hard disk drive (Macintosh Performa 6400/200)
- * Internal Apple SuperDrive floppy disk drive
 - Uses high-density, 1.4MB floppy disks
 - Reads, writes, and formats Macintosh, Windows, MS-DOS, OS/2, and ProDOS disks

- * Internal AppleCD 8x drive

Modem

=====

- * 28.8-Kbit/s data/voice/fax modem*
- * Built-in error correction and compression (MNP4, V.42, MNP5, V.42bis)

Sound

=====

- * Stereo 16-bit sound
- * SRS surround-sound enhancement
- * Subwoofer speaker
- * Sound-input port (for an Apple PlainTalk microphone, other microphone, or standard mini-plug audio cable)
- * Sound-output port
- * Front headphone jack and volume control

Interfaces

=====

- * SCSI interface port for connecting as many as five external SCSI devices, such as disk drives, CD-ROM drives, and scanners (multiple devices can be connected to each other from one port)
- * Pre-cabled SCSI expansion bay for additional 5.25-inch internal SCSI device
- * Apple Desktop Bus port for mouse, keyboard, and other devices (multiple devices can be connected to each other from one port)
- * Two serial ports (RS-232/RS-422) for an AppleTalk network connection, other network connections, communications equipment (including GeoPort compatible devices), or a printer
- * Video-output port
- * Two PCI expansion slots (require PCI cards that come with a Macintosh driver and are PCI 2.0-compliant; NuBus cards cannot be used in these slots)
- * Communications (Comm II) slot for a 28.8-Kbit/s modem (used by built-in modem*)
- * Video input slot for optional Apple Video System (supports NTSC, PAL, and SECAM video formats)
- * Expansion bay for optional Apple TV/FM Radio System
- * Infrared receiver for remote control (provided with Apple TV/FM Radio System)

Display support

=====

- * 1 MB of video RAM
- * 16-bit color for display of up to 32,768 colors on monitors using 640- by 480-pixel or 800- by 600-pixel resolution
- * 8-bit color for display of 256 colors on monitors using 832- by 624-pixel or 1,024- by 768-pixel resolution

Electrical requirements and compliance

=====

- * Line voltage: 100 to 125/200 to 240 V AC, RMS, single phase
- * Frequency: 47 to 63 Hz
- * Power: 220 W maximum (continuous)
- * Includes low-power sleep mode
- * Energy saving in sleep mode.

Size and weight

=====

- * Height: 16 in. (40.6 cm)
- * Width: 7.8 in. (19.8 cm)
- * Depth: 16.9 in. (42.8 cm)
- * Weight: 44.5 lb. (20.18 kg)

Operating environment

=====

- * Operating temperature: 50 to 97 degrees F (10 to 35 degrees C)
- * Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- * Relative humidity: 5% to 95%, noncondensing
- * Maximum altitude: 10,000 ft. (3,048 m)

Disability access

=====

- * CloseView software magnifies screen image up to 16 times
- * Easy Access software permits combination keys to be pressed sequentially and enables cursor control from the numeric keypad instead of the mouse
- * Visual beep replaces audible system alerts

LaserWriter Printers: TCP/IP Solutions Guide (3/97)

Revised: 3/20/97
Security: Everyone

LaserWriter Printers: TCP/IP Solutions Guide (3/97)

Article Created: 9 July 1996
Article Reviewed/Updated: 20 March 1997

TOPIC -----

This article provides solutions for printing to an Apple LaserWriter printer using TCP/IP.

DISCUSSION -----

Although UNIX workstations are the traditional source of LPR printing, LPR is defined in Internet RFC 1179, and can be implemented on any computer using TCP/IP networking. The growth of Internet, intranet and Open Systems environments means Apple customers will see increasing need to support TCP/IP printing from all computer systems, including mainframes, mini computers, DOS/Windows, and Mac OS systems.

Since most Apple LaserWriter printers accept print jobs transmitted only by AppleTalk, customers often need solutions for getting their print job from a TCP/IP based computer to an AppleTalk-only printer.

There are three possible solutions for printing to an Apple LaserWriter printer using TCP/IP:

- 1 - Configure the LaserWriter for TCP/IP printing (LPR)
- 2 - TCP/IP - AppleTalk conversion (LPR-PAP)
- 3 - Direct Serial or parallel connections

This article also contains a list of LaserWriter printers which cannot be used with a TCP/IP connection.

Solution: Configure the LaserWriter for TCP/IP Printing (LPR)

Apple has provided TCP/IP support in recent, high-end printers. The following

models are designed to support TCP/IP printing:

LaserWriter Pro 810
LaserWriter 16/600 PS
Color LaserWriter 12/600 PS
LaserWriter 12/640 PS

TCP/IP jobs are received through the Ethernet port. These printers support PostScript, PCL and/or text. Your LaserWriter User's Guide contains complete configuration information.

Some TCP/IP software requires you to enter a socket number. Apple LaserWriters use 515, which is the default number specified by RFC 1179.

The LaserWriter Pro 810 also accepts jobs to arbitrarily defined port numbers.

Solution: TCP/IP - AppleTalk Conversion (LPR-PAP)

=====

If you have a non-TCP/IP LaserWriter, you can translate LPR print jobs to PAP sessions in AppleTalk. This allows you to print with a TCP/IP based system and the printer to receive an AppleTalk print job.

Translation of TCP/IP to AppleTalk is available in several types of products:

Network Hardware

Several vendors have made network hardware products that accept LPR jobs using TCP/IP and forward them as PAP jobs using AppleTalk. Most of these products are no longer manufactured, although you may find them installed in established sites. The only shipping product that Apple is aware of is GatorPrint by Cayman Systems. This package is software that is installed on Cayman routers.

AppleTalk for UNIX Systems

Most AppleTalk software for UNIX systems include print spooling and conversion utilities. Here is a partial list of products:

- Helios Ethershare
- K-Spool from Mt. Xinu.
- uShare from Information Presentation Technologies, Inc.
- CAP (Columbia AppleTalk Package) from Columbia University.
- netatalk from the University of Michigan

AppleTalk on Other Advanced Server Operating Systems

In theory, multi-protocol operating systems such as Novell NetWare, Windows NT, and OS/2 can receive jobs with a TCP/IP spooler and forward them to an AppleTalk based print spooler. We have seen few customers sites with this configuration.

This solution works for the following LaserWriter models:

Begin_Table

LaserWriter Model	Port	Notes
LaserWriter (original)	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
LaserWriter Plus	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
LaserWriter IINT	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
LaserWriter IINTX	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
LaserWriter IIIf	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
LaserWriter IIg	Ethernet	
Personal LaserWriter NT	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
Personal LaserWriter NTR	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
Personal LaserWriter 320	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
LaserWriter Select 360	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet bridge
LaserWriter Pro 600	LocalTalk	
LaserWriter Pro 630	Ethernet	
LaserWriter 4/600	LocalTalk	Must be connected to Ethernet using a LocalTalk-Ethernet

		bridge
+	+	+

End_Table

Note:

AppleTalk printing is traditionally define as PostScript only, Apple recommends sending only PostScript over AppleTalk to printers.

Solution: Direct Serial or Parallel Connections

=====

Most Apple LaserWriter models have serial and parallel ports for Windows printing. UNIX (and to a lesser degree Windows NT and Novell NetWare) servers can be configured to receive TCP/IP jobs and spool using a direct connection to the printer.

Connection configuration (serial and parallel) and page description language (text, PostScript, and PCL) vary by LaserWriter model.

Although Apple serial and parallel ports conform to industry standards, these configurations are not supported by Apple Computer, Inc. Apple Technical support may include articles that describe sample configurations for illustrative purposes only.

This class of solutions applies to all the LaserWriters listed in the previous table, as well as the LaserWriter Select 310 printer.

No Solution Available

=====

The following Apple LaserWriter printers do not have a TCP/IP printing solution, due to lack of PostScript and/PCL support.

LaserWriter IISC

Personal LaserWriter LS

Personal LaserWriter SC

Personal LaserWriter 300

LaserWriter Select 300

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

Color OneScanner Dispatcher Software: Image Cropping (7/96)

Revised: 7/9/96
Security: Everyone

Color OneScanner Dispatcher Software: Image Cropping (7/96)

=====

Article Created: 9 July 1996

TOPIC -----

With both v1.0 and v1.0.2 of the Apple Color OneScanner Dispatcher Software, When I select Preview after selecting Straighten Automatically, the automatic option Suggest Crop is also selected. Why?

DISCUSSION -----

You are seeing the normal operation of the OneScanner Dispatcher Software. If you do not want to use the suggested crop, you should use the selection marquee prior to crop your image prior to selecting Scan.

Color OneScanner Dispatcher Software: Auto Straighten Issue 7/96

Revised: 7/9/96
Security: Everyone

Color OneScanner Dispatcher Software: Auto Straighten Issue 7/96

=====

Article Created: 9 July 1996

TOPIC -----

Scanning with Automatic Straighten feature does not always give good results. The scanned image is sometimes rotated 30-45% or more, and the scaling may be incorrect.

DISCUSSION -----

Both the v1.0 and v1.0.2 versions of the Apple Color OneScanner Dispatcher Software sometimes do not perform the Automatic Straighten function correctly. One workaround that sometimes helps is not to place the original image adjacent to the alignment mark and rulers. The other workaround is not to use the Automatic Straighten feature if you encounter this problem.

Color STW 2200 & 2400: Differences in v.2.1.1 vs 2.1.2 (7/96)

=====

Article Created: 10 July 1996

TOPIC -----

What differences between the Color StyleWriter v2.1.1 on the System Update 2.0 CD and v2.1.2 posted to Apple Software Updates?

DISCUSSION -----

The only differences between the Color StyleWriter 2200 and Color StyleWriter 2400 v2.1.1 and v2.1.2 are:

Begin_Table

+=====+			
	Version 2.1.1		Version 2.1.2
+=====+			
Desktop Printing	v1.0.1		v1.0.3
+-----+			
ColorSync	v2.0		v2.0.1
+-----+			

End_Table

There were also some changes in the Watermark file sizes and modification dates.

All other files on the disks are the same, including the Printer drivers and PrinterShare.

MacDNS and AIMS setup (7/96)

Revised: 7/15/96
Security: Everyone

MacDNS and AIMS setup (7/96)

Article Created: 10 July 1996

TOPIC -----

I am setting up Apple Internet Mail Server (AIMS) and MacDNS on the same machine for my domain, company.com. I have given the server itself the name 'mail.company.com', but I would like my users to be able to receive email '@company.com' instead of '@mail.company.com'. How can I achieve this?

DISCUSSION -----

Because 'company.com' represents the whole domain, not a single machine in that domain, you do not need to enter it as a permanent host with a unique IP address. You just want to assign a mail exchanger to it. When e-mail is to be delivered to 'user@company.com', the sending mailserver will query for the mail exchanger of 'company.com' and get the address of 'mail.company.com'.

Here is how to accomplish this:

Step 1

In MacDNS, create a permanent host for the server itself (if you have not already done so), giving it whatever name you like, such as "mail.company.com". You may want to make some aliases to it, if it runs other services as well, such as "ftp.company.com" and/or "www.company.com". Also add a mail exchanger for the server, which would just point back to itself (example: 10 mail.company.com)

Step 2

In MacDNS, create an 'MX-only host' record, for host 'company.com'. Type in the appropriate numeric preference and hostname in Mail Exchanger field, such as "10 mail.company.com".

Step 3

In AIMS, under 'Server:Preferences' menu in "Server names", add both of these domains (for example, 'company.com' <default> and 'mail.company.com').

Apple Printers: lpi for QuickDraw Printers (7/96)

Revised: 7/23/96
Security: Everyone

Apple Printers: lpi for QuickDraw Printers (7/96)

Article Created: 10 July 1996
Article Reviewed/Updated: 23 July 1996

TOPIC -----

PostScript LaserWriter printers have lpi (lines per inch) values. However, I would like this information for the Color StyleWriter printers, and non-PostScript LaserWriter printers. In particular, I would like to get the Color StyleWriter 2400 lpi value.

DISCUSSION -----

The lpi for the Color StyleWriter 2400 in Pattern mode is 64 lpi, and allows for approximately 160 levels of gray/colors. The best output from that printer can actually be obtained from using the Scatter mode as a different rendering technique is used (instead of a line screen) that allows for the highest resolution of the image to be utilized -- up to 360 dpi.

Q&A for lpi using QuickDraw Printers
=====

Question: Is lpi a valid measurement/specification for Ink Jet printers?

Answer: Yes it is. Inkjet printer drivers also use halftoning.

Question: How does lpi specifications differ from a laser printer?

Answer: The halftoning concept is the same, however, it generally is not "adjustable" on the fly like PostScript laser printers. To adjust lpi on a PostScript laser printer, all you do is to change the parameters provided with the halftone PostScript commands. For QuickDraw printers, the lpi is a set value determined by the driver engineer. Although the lpi value can be changed, this requires recompilation of the driver source code.

Question: Is there a comprehensive list of all Apple printers and related specifications such as lpi, shades of gray, and number of colors?

Answer: There is not a comprehensive list available, and creating one is not possible since some of these printers are quite old and the original engineers and/or documentation is not available. Here is some information on some Apple Printers, which should help you.

Begin_Table

Printer	Technique	lpi	Levels of Gray/Color	Notes
StyleWriter I	Pattern	64	approx 160	1
StyleWriter II	Pattern	64	approx 160	1
StyleWriter 1200	Pattern	64	approx 160	
	Scatter	*	*	2
StyleWriter 1500	Pattern	64	approx 160	
	Scatter	*	*	2
Apple Color Printer	Pattern	64	approx 160	1
Color StyleWriter Pro	Pattern	64	approx 160	
	Scatter	*	*	2
Color StyleWriter 2200	Pattern	64	approx 160	
	Scatter	*	*	2
Color StyleWriter 2400	Pattern	64	approx 160	
	Scatter	*	*	2
Color StyleWriter 2500	Pattern	64	approx 160	
	Scatter	*	*	2
Personal LaserWriter LS	Pattern	64	approx 160	1
LaserWriter Select 300	Pattern	64	approx 160	1
Personal LaserWriter 300	Pattern	64	approx 160	1

+=====+		
	Notes	
+=====+		
1	Use a different pattern technique than the current implementation	
	used in the Color StyleWriter Printers such as the Color	
	StyleWriter 1200 and the Color StyleWriter 1500 Printers.	
+-----+		
2	The Scatter technique (recommended for best output) does not use	
	halftoning techniques and allows for use of the highest	
	resolution of an image, up to the 360 dpi of the printer.	
+=====+

LaserWriter Pro 810: Common RCF Errors (7/96)

Article Created: 11 July 1996

TOPIC -----

This article describes the most common errors that can appear on the Remote Control Facility (RCF) when the LaserWriter Pro 810 printer is powered on.

DISCUSSION -----

The following error appears when the LaserWriter Pro 810 printer has a thinnet Ethernet connector, and is not connected to a properly terminated thinnet network:

LAN XLP FAIL Error Level = 03

Server -910- Ethernet cable possibly open at 0 ns (0 ft thin, 0 ft thick)
Server -922- Non-fatal error detected by selftest, code = ++++2

This error does not affect other forms of networking or printing.

The following error appears when the LaserWriter Pro 810 printer has a twisted pair Ethernet connector, and is not connected to a properly terminated twisted pair network:

LAN XLP FAIL Error Level = 08
Server -922- Non-fatal error detected by selftest, code = ++++2

LaserWriter Driver: PPD file Determines Imageable Area (7/96)

=====

Article Created: 11 July 1996

TOPIC -----

I am using an Hewlett-Packard (HP) 4M printer with my Macintosh computer. I have connected them using an Ethernet connection, and I am using the Apple LaserWriter 8.3.4 printer driver. When I set the margin to 0 and click Larger Print Area in the Print Setup dialog, I still get a large margin. Also, the text on the edges is being cut off, so it is trying to print to the edges of the paper.

Using this printer with UNIX workstations, or MS-Windows computers, I can printer almost edge-to-edge. Is there something in the Macintosh LaserWriter driver that is not allowing me to print to the edge?

DISCUSSION -----

The maximum printable area is defined in the PPD supplied by the printer manufacturer. If you are not using the correct HP PPD file or the PPD does not accurately represents the printer engines maximum print area, then the print job could request the PostScript interpreter to create a raster image that extends beyond the engines physical margins and ability to print it. This could result in the symptoms you are describing, in that the image area is getting clipped.

You should contact Hewlett-Packard Tech Support to obtain the appropriate PPD file.

Network Assistant: Talk - Requires Dual Channel Sound (8/96)

Revised: 8/22/96
Security: Everyone

Network Assistant: Talk - Requires Dual Channel Sound (8/96)

Article Created: 12 July 1996
Article Reviewed/Updated: 22 August 1996

TOPIC -----

Will the "Talk" feature in the Network Assistant work with all Macintosh computers?

DISCUSSION -----

The "Talk" feature in the Apple Network Administrator Toolkit requires a Macintosh with dual channel sound capabilities. In other words, a computer that can record and playthrough sound at the same time.

The "Talk" feature will not work with the systems listed below :

Macintosh Classic
Macintosh Classic II
Macintosh Color Classic
Macintosh Color Classic II
Macintosh SE/30
Macintosh IIfx
Macintosh IIfx
Macintosh IIfx
Macintosh LC
Macintosh LC II
Macintosh LC III
Macintosh LC 475
Macintosh LC 520
Macintosh LC 550
Macintosh LC 575
Macintosh Quadra 605

Macintosh Performa 200
Macintosh Performa 250
Macintosh Performa 275

Macintosh Performa 400
Macintosh Performa 405
Macintosh Performa 410
Macintosh Performa 430
Macintosh Performa 450
Macintosh Performa 460 Series
Macintosh Performa 475
Macintosh Performa 476
Macintosh Performa 520
Macintosh Performa 550
Macintosh Performa 560
Macintosh Performa 570 Series
Macintosh Performa 600 Series

Macintosh PowerBook Duo 200 Series
Macintosh PowerBook Duo 2300*
Macintosh Duo MiniDock
Macintosh Duo Dock
Macintosh Duo Dock II
PowerBook Duo Dock Plus

* Although the Macintosh PowerBook Duo 2300 is able to record and playthrough sound simultaneously, the Talk feature is disabled on this system due to a software issue discovered late in the process.

Color StyleWriter 2500: Premium Coated Paper Available (7/96)

=====

Article Created: 12 July 1996

TOPIC -----

The Apple finished goods price list states that the Apple Color Ink-Jet Premium Plus Coated Paper (M4792G/A) is only compatible with the Color StyleWriter 2500 printer. Will it harm my other StyleWriter printers if I try to use it?

DISCUSSION -----

The Apple Color Ink-Jet Premium Plus Coated Paper is optimized for use only on the higher-resolution 720 DPI Color Ink-Jet printers. The Color StyleWriter 2500 is the only Apple color ink-jet printer currently available that can take advantage of the paper's special coated surface which controls ink flow and maximizes print quality. The Premium Plus paper will not harm other ink-jet printers if it is used, however, there is no advantage to upgrading to the more expensive Premium Plus paper stock unless it is used with the Color StyleWriter 2500.

Apple Remote Access Personal Server For Macintosh ReadMe (7/96)

=====

Article Created: 15 July 1996

TOPIC -----

The following article is the Read Me document for the Apple Remote Access (ARA) Personal Server version 2.1.

DISCUSSION -----

APPLE REMOTE ACCESS PERSONAL SERVER FOR MACINTOSH READ ME

=====

This document provides late-breaking news about the Apple Remote Access Personal Server that is not covered in the "Apple Remote Access Personal Server User's Guide." You may need to refer to that guide to understand the use of several terms in this document, and you may want to print this document to keep with your user's guide.

Modems Supported by the Apple Remote Access Personal Server

=====

Scripts that support most popular modems are provided on the Remote Access Personal Server installation disks. The scripts include:

- 3Com Impact Analog 14.4
- 3Com Impact ISDN 56K
- 3Com Impact ISDN 64K
- Apple Modem 2400
- AT&T Dataport 288
- AT&T KeepInTouch
- Dayna CommuniCard 28800
- Farallon Netopia 56K
- Farallon Netopia 64K
- GeoPort/Express Modem
- GeoPort/Express Modem CNG
- Global Village Gold/Silver/Mercury

Global Village Platinum
Hayes Accura 288
Hayes Optima 14.4
Hayes Optima 288
Megahertz CruiseCard 14.4
Megahertz CruiseCard 28.8
Metricom Ricochet Wireless
Microcom MicroPorte 4232bis
Microcom QX/4232bis
Motorola 326xV34
Motorola BitSURFR 56K
Motorola BitSURFR 64K
Motorola Power/Lifestyle 28.8
Practical Peripherals V.34
Prometheus ProModem 144e
Prometheus ProModem 96
PSI PowerModem II
PSI PowerModem III/IV
Supra 144
Supra 288
TDK DF2814
Telebit QBlazer
Telebit T3000
Telebit Worldblazer
US Robotics Universal
Zoom V-series

Beginning with version 2.1 of the Apple Remote Access Personal Server and the companion Client product, modem scripts are no longer stored in the Extensions Folder. A new folder called "Modem Scripts" within the Extensions Folder is created by Apple Remote Access to hold modem scripts.

The Apple Remote Access Installer will move any existing scripts you may already have in your Extensions Folder to the new Modem Scripts folder in addition to placing scripts for all the modems listed above into the Modem Scripts folder.

Future remote access products from Apple will also use the Modem Scripts folder. However, there will be a transition period before other products are updated to use the new folder. Some existing products may install modem scripts into the Extensions Folder. If such a product is installed after Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the script.

You can use modem scripts included with the Apple Remote Access MultiPort Server (any version) with version 2.1 of Apple Remote Access Personal Server. You can also use AppleTalk Remote Access version 1.0 modem scripts with version 2.1 of the Personal Server, but certain new features, such as Ignore Dial Tone, Manual Dialing, and MNP 10 support, will not be available. Additionally, you will be able to use scripts from future Apple dial-up products with version 2.1 of Apple Remote Access. But, see the note below on some issues related to manual dialing.

Apple Remote Access and System 7.5.3

=====

The Read Me documents for System 7.5.3 and System Update 2.0 suggest that Apple Remote Access should be installed before System 7.5.3. This is not necessary. Beginning with version 2.1, Apple Remote Access should be installed after System 7.5.3.

Installing ARA X.25 Client over Apple Remote Access 2.1

=====

The Apple Remote Access X.25 Client installer places X.25 scripts into the Extensions folder. If you install the X.25 additions after installing Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the X.25 scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the scripts.

If you use the Apple Remote Access 2.1 installer to upgrade your existing Remote Access 2.0.1 and X.25 Client, the installer will move the scripts for you.

Compatibility with AppleTalk Remote Access 1.0

=====

Version 2.1 of the Apple Remote Access Personal Server will successfully connect to both AppleTalk Remote Access 1.0 compatible servers and Apple Remote Access 2.x compatible servers. The compatibility setting in the connection document of earlier version 2.0 and 2.0.1 has been removed. Since connection to either style server is automatic, the setting is no longer necessary.

The next major upgrade to Apple Remote Access will no longer support ARA 1.0 clients or servers.

Using an MNP 10 Modem

=====

MNP 10 is an error-correction protocol that allows for more reliable data connections over cellular modems. Clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window puts MNP 10 modems into cellular mode. Do not click the "Use MNP 10 error correction in modem" checkbox to use MNP 10 over land lines.

To establish an MNP 10 connection, both your modem and the modem you are calling must support MNP 10; clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window is not by itself sufficient to establish an MNP 10 connection.

Manual Dialing

=====

The method used to do manual dialing in Apple Remote Access 2.0/2.0.1 has not worked well. Apple Remote Access presents a dialog asking you to dial, wait for the phone to ring, and then press OK. Often the user has to experiment to determine exactly when to press OK to dismiss the dialog.

To improve manual dialing, a new dialog has been incorporated into the modem scripts installed along with version 2.1 of Apple Remote Access. Two dialogs are now displayed when doing manual dialing. This first dialog is still present to provide backwards compatibility with the wide variety of existing modem scripts. When using newer scripts, the first dialog box should be dismissed before dialing, and you will be prompted by the modem script when to actually dial the phone. If you are using a modem script not included with this product, you may have to experiment to determine if the first dialog box should be ignored.

Future remote access and dial-up products from Apple will require the new style scripts and will not present two dialog boxes.

Using the Redialing Feature

=====

If the redialing option is selected, the Remote Access Personal Server attempts redialing only when the phone number that has been dialed is busy. If the connection attempt fails for any other reason including a failed callback attempt, Remote Access stops redialing so that you can correct any problems.

If you use the Redialing option, set the "Time between retries" number to five seconds or greater. Anything less than five seconds may not give your modem sufficient time to reset.

When using the Redialing Alternate Number option, the main number is dialed once and then redialing sequence alternates between the alternate and main numbers.

Using DialAssist

=====

If you are calling within a country with no city or area codes, and you encounter problems using DialAssist, try entering a space in the "Connect To City/Area Code" box in your connection document.

Serial Port Arbitration

=====

When a Remote Access connection is established, Remote Access prevents other application programs from using the serial port selected in the Remote Access Setup control panel. Most programs will inform you that the port is in use.

Apple Remote Access Personal Server provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect that a program is not compatible with the Serial Port Arbitrator:

1. Remove the Serial Port Arbitrator file from the Extensions folder.
2. Restart your Macintosh.
3. Try the program again.

NOTE: The Serial Port Arbitrator will not work on a Macintosh if Remote Access Personal Server has not been installed.

High Speed Serial Connections

=====

Both Apple Remote Access Personal Server 2.1 and Client 2.1 support specifying a serial connection speed of 115200 bps in a modem script. Not all Macintosh built-in serial ports support connection speed of 115200 bps. Here is a list of Macintoshes that do.

Centris/Quadra 660AV, Quadra 840AV

Macintosh Performa 61xx

Power Macintosh 61xx, 71xx, 72xx, 75xx, 76xx, 81xx, 85xx, 95xx

Workgroup Server 6150, 7250, 8150, 8550, 9150

In order to use the serial port at 115200 bps on one of these computers, you need a new serial extension called SerialDMA. System 7.5.3 or later incorporates this driver into the operating system.

If you use a modem script that specifies 115200 bps, and your computer does not support this data rate, Apple Remote Access will automatically fall back to 57600 bps.

Using a Local Printer

=====

If you are using a non-networked printer connected to the printer port of your Macintosh, you may get an error dialog when trying to initiate a connection or when trying to print while connected saying that one of your serial ports is already in use. You may need to select Remote Only in the Network Control Panel (AppleTalk Control panel for Open Transport-based machines).

Apple Remote Access Personal Server and the Apple Internet Router

=====

Apple Remote Access Personal Server should not be installed on the same Macintosh as the Apple Internet Router.

Using ARA Security Modules (like SecurID) with Virtual Memory

=====

There is an incompatibility between some ARA security modules (like SecurID) and Virtual Memory. This bug has been fixed in the latest system release (7.5.3).

Changes in version 2.1 of the Apple Remote Access Personal Server

=====

Modem scripts have been moved to a new Modem Scripts folder within the Extensions Folder.

The compatibility option in the connection document is no longer necessary and has been removed.

The method of manual dialing has been changed. See the section above.

Interoperability with some non-Apple Remote Access Servers has been improved.

The installer has been upgraded from version 3.4 to version 4.0.3.

There is no longer a separate Remote Access Aliases extension.

The installer is now on a single high-density diskette.

A bug that caused machines with certain extensions to crash during boot has been fixed in the Serial Port Arbitrator.

Serial port rates of up to 115,200 bps are now supported in modem scripts. If the computer doesn't support 115,200, Apple Remote Access will use 57,600 bps instead.

Apple Remote Access 2.1 Client For Macintosh Read Me (7/96)

Revised: 7/15/96
Security: Everyone

Apple Remote Access 2.1 Client For Macintosh Read Me (7/96)

Article Created: 15 July 1996

TOPIC -----

The following article is the ReadMe document for the Apple Remote Access (ARA) Client version 2.1.

DISCUSSION -----

APPLE REMOTE ACCESS CLIENT FOR MACINTOSH READ ME

=====

This document provides late-breaking news about the Apple Remote Access Client that is not covered in the "Apple Remote Access Client User's Guide." You may need to refer to that guide to understand the use of several terms in this document, and you may want to print this document to keep with your user's guide.

Modems Supported by the Apple Remote Access Client

=====

Scripts that support most popular modems are provided on the Remote Access Client installation disks. The scripts include:

- 3Com Impact Analog 14.4
- 3Com Impact ISDN 56K
- 3Com Impact ISDN 64K
- Apple Modem 2400
- AT&T Dataport 288
- AT&T KeepInTouch
- Dayna CommuniCard 28800
- Farallon Netopia 56K
- Farallon Netopia 64K
- GeoPort/Express Modem
- GeoPort/Express Modem CNG
- Global Village Gold/Silver/Mercury

Global Village Platinum
Hayes Accura 288
Hayes Optima 14.4
Hayes Optima 288
Megahertz CruiseCard 14.4
Megahertz CruiseCard 28.8
Metricom Ricochet Wireless
Microcom MicroPorte 4232bis
Microcom QX/4232bis
Motorola 326xV34
Motorola BitSURFR 56K
Motorola BitSURFR 64K
Motorola Power/Lifestyle 28.8
Practical Peripherals V.34
Prometheus ProModem 144e
Prometheus ProModem 96
PSI PowerModem II
PSI PowerModem III/IV
Supra 144
Supra 288
TDK DF2814
Telebit QBlazer
Telebit T3000
Telebit Worldblazer
US Robotics Universal
Zoom V-series

Beginning with version 2.1 of the Apple Remote Access Client and the companion Personal Server product, modem scripts are no longer stored in the Extensions Folder. A new folder called "Modem Scripts" within the Extensions Folder is created by Apple Remote Access to hold modem scripts.

The Apple Remote Access Installer will move any existing scripts you may already have in your Extensions Folder to the new Modem Scripts folder in addition to placing scripts for all the modems listed above into the Modem Scripts folder.

Future remote access products from Apple will also use the Modem Scripts folder. However, there will be a transition period before other products are updated to use the new folder. Some existing products may install modem scripts into the Extensions Folder. If such a product is installed after Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the script.

You can use modem scripts included with the Apple Remote Access MultiPort Server (any version) with version 2.1 of Apple Remote Access Client. You can also use AppleTalk Remote Access version 1.0 modem scripts with version 2.1 of the Client, but certain new features, such as Ignore Dial Tone, Manual Dialing, and MNP 10 support, will not be available. Additionally, you will be able to use scripts from future Apple dial-up products with version 2.1 of Apple Remote Access. But, see the note below on some issues related to manual dialing.

Apple Remote Access and System 7.5.3

=====

The Read Me documents for System 7.5.3 and System Update 2.0 suggest that Apple Remote Access should be installed before System 7.5.3. This is not necessary. Beginning with version 2.1, Apple Remote Access should be installed after System 7.5.3.

Installing ARA X.25 Client over Apple Remote Access 2.1

=====

The Apple Remote Access X.25 Client installer places X.25 scripts into the Extensions folder. If you install the X.25 additions after installing Apple Remote Access 2.1, you will have to open your Extensions Folder and drag the X.25 scripts into the Modem Scripts folder in order for Apple Remote Access to recognize the scripts.

If you use the Apple Remote Access 2.1 installer to upgrade your existing Remote Access 2.0.1 and X.25 Client, the installer will move the scripts for you.

Compatibility with AppleTalk Remote Access 1.0

=====

Version 2.1 of the Apple Remote Access Client will successfully connect to both AppleTalk Remote Access 1.0 compatible servers and Apple Remote Access 2.x compatible servers. The compatibility setting in the connection document of earlier version 2.0 and 2.0.1 has been removed. Since connection to either style server is automatic, the setting is no longer necessary.

The next major upgrade to Apple Remote Access will no longer support ARA 1.0 clients or servers.

Using an MNP 10 Modem

=====

MNP 10 is an error-correction protocol that allows for more reliable data connections over cellular modems. Clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window puts MNP 10 modems into cellular mode. Do not click the "Use MNP 10 error correction in modem" checkbox to use MNP 10 over land lines.

To establish an MNP 10 connection, both your modem and the modem you are calling must support MNP 10; clicking the "Use MNP 10 error correction in modem" checkbox in the Remote Access Setup window is not by itself sufficient to establish an MNP 10 connection.

Manual Dialing

=====

The method used to do manual dialing in Apple Remote Access 2.0/2.0.1 has not worked well. Apple Remote Access presents a dialog asking you to dial, wait for the phone to ring, and then press OK. Often the user has to experiment to determine exactly when to press OK to dismiss the dialog.

To improve manual dialing, a new dialog has been incorporated into the modem

scripts installed along with version 2.1 of Apple Remote Access. Two dialogs are now displayed when doing manual dialing. This first dialog is still present to provide backwards compatibility with the wide variety of existing modem scripts. When using newer scripts, the first dialog box should be dismissed before dialing, and you will be prompted by the modem script when to actually dial the phone. If you are using a modem script not included with this product, you may have to experiment to determine if the first dialog box should be ignored.

Future remote access and dial-up products from Apple will require the new style scripts and will not present two dialog boxes.

Using the Redialing Feature =====

If the redialing option is selected, the Remote Access Client attempts redialing only when the phone number that has been dialed is busy. If the connection attempt fails for any other reason including a failed callback attempt, Remote Access stops redialing so that you can correct any problems.

If you use the Redialing option, set the "Time between retries" number to five seconds or greater. Anything less than five seconds may not give your modem sufficient time to reset.

When using the Redialing Alternate Number option, the main number is dialed once and then redialing sequence alternates between the alternate and main numbers.

Using DialAssist =====

If you are calling within a country with no city or area codes, and you encounter problems using DialAssist, try entering a space in the "Connect To City/Area Code" box in your connection document.

Serial Port Arbitration =====

When a Remote Access connection is established, Remote Access prevents other application programs from using the serial port selected in the Remote Access Setup control panel. Most programs will inform you that the port is in use.

Remote Access Client provides this port arbitration through a system extension called the Serial Port Arbitrator located in the Extensions folder. Some programs that use the serial port may not be compatible with this extension. If you suspect that a program is not compatible with the Serial Port Arbitrator:

1. Remove the Serial Port Arbitrator file from the Extensions folder.
2. Restart your Macintosh.
3. Try the program again.

NOTE: The Serial Port Arbitrator will not work on a Macintosh if Remote Access Client has not been installed.

High Speed Serial Connections

=====

Both Apple Remote Access Personal Server 2.1 and Client 2.1 support specifying a serial connection speed of 115200 bps in a modem script. Not all Macintosh built-in serial ports support connection speed of 115200 bps. Here is a list of Macintoshes that do.

Centris/Quadra 660AV, Quadra 840AV
Macintosh Performa 61xx
Power Macintosh 61xx, 71xx, 72xx, 75xx, 76xx, 81xx, 85xx, 95xx
Workgroup Server 6150, 7250, 8150, 8550, 9150

In order to use the serial port at 115200 bps on one of these computers, you need a new serial extension called SerialDMA. System 7.5.3 or later incorporates this driver into the operating system.

If you use a modem script that specifies 115200 bps, and your computer does not support this data rate, Apple Remote Access will automatically fall back to 57600 bps.

Using a Local Printer

=====

If you are using a non-networked printer connected to the printer port of your Macintosh, you may get an error dialog when trying to initiate a connection or when trying to print while connected saying that one of your serial ports is already in use. You may need to select Remote Only in the Network Control Panel (AppleTalk Control panel for Open Transport-based machines).

Apple Remote Access Client and the Apple Internet Router

=====

Apple Remote Access Client should not be installed on the same Macintosh as the Apple Internet Router.

Using ARA Security Modules (like SecurID) with Virtual Memory

=====

There is an incompatibility between some ARA security modules (like SecurID) and Virtual Memory. This bug has been fixed in the latest system release (7.5.3).

Changes in version 2.1 of the Apple Remote Access Client

=====

Modem scripts have been moved to a new Modem Scripts folder within the Extensions Folder.

The compatibility option in the connection document is no longer necessary and has been removed.

The method of manual dialing has been changed. See the section above.

Interoperability with some non-Apple Remote Access Servers has been improved.

The installer has been upgraded from version 3.4 to version 4.0.3.

There is no longer a separate Remote Access Aliases extension.

The installer is now on a single high-density diskette.

A bug that caused machines with certain extensions to crash during boot has been fixed in the Serial Port Arbitrator.

Serial port rates of up to 115,200 bps are now supported in modem scripts. If the computer does not support 115,200, Apple Remote Access will use 57,600 bps instead.

Text Clippings and Screen Redraw (7/96)

Revised: 7/15/96
Security: Everyone

Text Clippings and Screen Redraw (7/96)

=====

Article Created: 15 July 1996

TOPIC -----

Sometimes I see an open text clipping window that does not redraw correctly. It appears that some text is missing or partially cropped from the window. However, the missing text is redrawn in a separate window smaller window in the upper left corner of the desktop. Why is this happening?

DISCUSSION -----

This is a known issue that is purely cosmetic. Apple is currently investigating the problem. There is a rare circumstance in which an open text clipping window will not redraw correctly, such that the included text will be absent or partially cropped, but redrawn in a separate window fragment in the upper left corner of the desktop.

Steps To Reproduce
=====

Step 1

Open SimpleText or any other drag and drop capable application.

Step 2

Drag a text selection to the desktop to create a clipping file, then open that file.

Step 3

Bring SimpleText, or anything but the Finder, to the front.

Step 4

If you then double-click on the clipping file again (even though its window is already open), whatever portion of the CONTENTS of that window

that was obscured by another window (even a Finder window) will be cropped out. However, the complete contents of that clipping file window WILL be displayed in another separate white box in the upper left corner of the desktop, below the menu bar. This box will have no borders or scroll bars, and will not be redrawn if another window is moved over it then moved away.

- This will not occur if, in the previous step, the Finder was allowed to come completely to the front and finish its redraws before double-clicking on the clipping file.

- Even if the clipping window is NOT obscured by any other window in step 4, if you simply move the clipping window anywhere after double-clicking its icon, the effect will be reproduced.

Macintosh Computers: Options for lpr Printing Available (7/95)

Revised: 7/15/96
Security: Everyone

Macintosh Computers: Options for lpr Printing Available (7/95)

=====

Article Created: 15 July 1996

TOPIC -----

How can I print from my Macintosh computer to a printer connected to the Ethernet using lpr/lpd?

DISCUSSION -----

There are several third-party products that can help you print using Berkeley Line Printer Protocols (lpr/lpd) as described in RFC1179.

Public Domain/ShareWare
=====

lpDaemon (description from lpDaemon readme file)

LPR is an lpDaemon client that submits jobs to a printer queue. Typically a text file is sent to a unix print queue. If the file is of type TEXT the end of lines are converted to unix style end of lines before sending, otherwise files are sent as is and marked with the 'literal' flag.

lpr (description from lpr1.2 readme file)

lpr is used to print Macintosh files by sending them to a remote lpd daemon. The files may be preformatted, formatted on the Macintosh, or formatted by lpd.

Public Domain and Shareware applications can be found on various online services, and the Internet.

Commercial Product
=====

InterPrint by Intercon (description from www.intercon.com web page)

InterPrint is the industry's first commercial implementation of an LPR client for the Apple Macintosh, and the only bi-directional printing software package that allows TCP/IP users to print cross-platform. It operates as a Chooser-selectable printer driver and runs transparently in the background. InterPrint can be used as an LPR client and/or an LPR server. Once installed, the server portion of the software operates as an extension. InterPrint Monitor mimics the UNIX LPQ command and allows users to easily check the status of print jobs. Users can print documents to a UNIX- or LPR-based printer without giving up the familiar Macintosh interface.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

QuickTake Cameras: Aren't Supported Using Windows 95 (7/95)

Revised: 7/15/96
Security: Everyone

QuickTake Cameras: Aren't Supported Using Windows 95 (7/95)

=====

Article Created: 15 July 1996

TOPIC -----

Are either of the QuickTake digital cameras (QuickTake 100, QuickTake 150) compatible with Microsoft Windows 95?

DISCUSSION -----

Windows 95 has not been officially tested using the Apple QuickTake Camera software, so it is not supported by Apple Computer, Inc. When Apple has completed testing and has finished qualifying products for Windows 95, there will be an announcement from Apple.

Unofficial testing with the QuickTake Software and Windows 95 did not present any problems on the computers we used. The QuickTake 150 software and QuickTake 100 software installed easily and functioned correctly. However, each system that you install the QuickTake software on may have different issues to deal with depending on the number of communication ports in use.

Power Macintosh 7600: Power Supply Fan Speed Fluctuations (7/96)

Revised: 7/16/96
Security: Everyone

Power Macintosh 7600: Power Supply Fan Speed Fluctuations (7/96)

=====

Article Created: 16 July 1996

TOPIC -----

I have noticed that the speed of the fan used in the power supply of my Power Macintosh 7600 series computer seems to change as the temperature in my office fluctuates. Is this considered normal?

DISCUSSION -----

The change in the speed of the fan that you are noticing is normal. The power supply used in the Power Macintosh 7200/7500/7600 series computers' enclosures contains a fan speed control circuit. The circuit is designed to monitor the temperature inside of the power supply and adjust the speed of the fan as the temperature of rises and lowers to compensate for the temperature change.

This fan speed control feature is not unique to this particular power supply. A similar fan speed control circuit is used in other desktop Macintosh computers as well.

ADDmotion Technical Support (7/96)

Revised: 7/16/96
Security: Everyone

ADDmotion Technical Support (7/96)

=====

Article Created: 16 July 1996

TOPIC -----

ADDmotion II is bundled with HyperCard 2.3. When you call the technical support number listed in the manual you are referred to another phone number.

DISCUSSION -----

Motion Works Group provides technical support for the product that ships with HyperCard. The number on the sticker of the ADDmotion manual, 415-541-9333 is no longer valid.

If customers dial 800-541-9333 they will reach an entirely different company.

To find the current phone number for the vendor use the search string "Motion Works Group".

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

MacIPX and Comm Slot II Ethernet Errors (4/97)

Revised: 4/23/97
Security: Everyone

MacIPX and Comm Slot II Ethernet Errors (4/97)

Article Created: 16 July 1996
Article Reviewed/Updated: 23 April 1997

TOPIC -----

The following two errors may be encountered when using version 5.11 of Novell's NetWare Client for Mac OS with Macintoshes that utilize the Apple Comm Slot II Ethernet adapter.

1) When attempting to configure MacIPX on a Power Macintosh 5400, 6400 or 6360, the following error is reported:

"Network interface Ethernet could not be selected due to error: -43 (0xffd5) please configure the Ethernet interface to ensure that the network driver can open properly."

2) When attempting to log in to the NetWare file server via the Novell Login Menu or mount a volume through the NetWare Directory Browser the following error is reported:

"There may be a problem with your network connection or MacIPX may not be configured properly. Use the MacIPX control panel to configure MacIPX."

DISCUSSION -----

Apple has developed the Power Macintosh or Performa 6360/64xx/54xx Update disk which will install the necessary "Ethernet shim" support to use MacIPX and DEC's LAT tool as a solution to problem #1 (above). This update is available for users to download from Apple's Software Update sites. Users should be sure they are running the latest versions of MacIPX or LAT Tool before installing the this update.

The 6360/64xx/54xx Update fixes have been rolled into Mac OS 7.6. If you have installed Mac OS 7.6, you do not need the 6360/64xx/54xx Update.

The error message returned in problem #2 (above) indicates that the MacIPX driver has not been opened. If you open the MacIPX control panel, you will see the Network Number and Node Number displayed as "N/A (driver not open)", which is normal after a restart.

Novell has updated the MacIPX Ethernet extension to allow MacIPX to initialize normally when attempting to log in to the the NetWare file server via the Novell Login Menu or mounting a volume through the NetWare Directory Browser. Be sure to read the "Update.TXT" text file that is included with the update for other fixes to the Mac Client Update.

This update can be downloaded from Novell's FTP site. The path is:

```
pub
  updates
    mac
      nwcmc511
      mclupd.bin
```

The update is also available from Novell's WWW site at the following URL's:

```
ftp://ftp.novell.com/pub/updates/nwos/iwsb411/mclupd.bin
ftp://137.65.2.100/pub/updates/nwos/iwsb411/mclupd.bin
```

Here are the installation steps for the MacIPX Ethernet Extension:

- 1) Delete old MacIPX Ethernet extension from Extensions folder.
- 2) Delete MacIPX Preferences in the Preferences folder, if it exists.
- 3) Copy new MacIPX Ethernet extension (1.3.1 (970404) PTF) into Extensions folder.
- 4) Restart Macintosh.

Note: The updated MacIPX Ethernet extension should be used with all Comm Slot II equipped Macintoshes.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

23 Apr 1997 - Updated with new information.
08 Apr 1997 - Article available to all.
25 Feb 1997 - Added Mac OS 7.6 information.

AppleShare 4.2.1 and ARA Multiport Server (7/96)

Revised: 7/18/96
Security: Everyone

AppleShare 4.2.1 and ARA Multiport Server (7/96)

=====

Article Created: 17 July 1996

TOPIC -----

I recently obtained the AppleShare 4.2.1 upgrade, which includes Apple Remote Access (ARA) Multiport Server 2.1. I cannot find the ARA Client software nor the four port serial card, both of which are mentioned in the ARA Multiport Server manual included with the upgrade. Where are those items?

DISCUSSION -----

The version of ARA Multiport server that is included with AppleShare 4.2.1 is a special version that does not contain the card or any client software. Those items need to be purchased separately.

StyleWriter EtherTalk Adapter: Troubleshooting Steps (8/96)

Revised: 8/8/96
Security: Everyone

StyleWriter EtherTalk Adapter: Troubleshooting Steps (8/96)

Article Created: 17 July 1996
Article Reviewed/Updated: 8 August 1996

TOPIC -----

This article contains several steps to help you troubleshoot issues you may be having with your StyleWriter EtherTalk Adapter.

The StyleWriter EtherTalk Adapter allows many Apple inkjet printers to be used over an EtherTalk based network, including as of the date this article was written: Color StyleWriter 1200, 1500, 2200, 2400, and 2500.

The StyleWriter EtherTalk Adapter requires the StyleWriter 2.2 driver, which shipped with the StyleWriter 1500. This software, for owners of other StyleWriter printers using the EtherTalk Adapter, is available electronically at Apple Software Update locations.

DISCUSSION -----

This article contains the following issues:

- No EtherTalk Adapter in Chooser
- Color StyleWriter Stops Printing in Mid-Job
- Desktop Print Monitor Status Reports Incorrect Information
- Macintosh "Crashed" or "Hung" During Print Job
- Ethernet Activity LED Blinks, But Not Printer Activity LED
- General Information About Using the StyleWriter EtherTalk Adapter
- StyleWriter EtherTalk Adapter LED Locations

No EtherTalk Adapter in Chooser
=====

PROBLEM:
Cannot see StyleWriter EtherTalk Adapter in the Chooser.

SOLUTION:

Check the following:

Ensure the Proper Printer is Being Accessed

The default name for the adapter is StyleWriter EtherTalk Adapter; however, you should determine whether the adapter was renamed. The easiest way to do this is to send a print job to a printer then verify the printer used to print the document.

You can also note what printer names appear in the Chooser, close the Chooser, and unplug the power cord from the EtherTalk Adapter connected to your printer, then check the Chooser again to see which printer is no longer listed. Restore power to the adapter once you identify the missing printer. After power is restored, verify in the Chooser that the printer reappears.

Rename Printer if Default Printer has Number Appended to It

The default name may have a number appended to it; that is, one may be named StyleWriter EtherTalk Adapter 1, another might read StyleWriter EtherTalk Adapter 2, if more than one unit with the default name resides in the same Ethernet zone. Each may be given unique names to work around this.

Use the Correct Ethernet Zone

Make sure that you are checking the proper zone for the printer in the Chooser.

Apply Power to Printer Before EtherTalk Adapter

Make sure the printer is powered on and is connected to the EtherTalk Adapter prior to supplying power to the EtherTalk Adapter.

Check the LED Lights on the EtherTalk Adapter

Check the LED lights on the EtherTalk Adapter after it is connected and powered on:

Begin_Table

+=====+			
LED		Normal Color	Notes
+=====+			
Test/Power		Green	
+-----+			
Printer Activity		Yellow	May blink if an incoming job is
			received.
+-----+			
Link		Green	Green if Ethernet is used.
+-----+			
Ethernet activity		Yellow	Blinks rapidly processing a job.
+=====+			

End_Table

Restart Ethernet Adapter if Test/Power LED is RED

If the Test/Power LED is red (the normal state is green), attempt to restart the adapter by unplugging then replugging the power to the unit. If this does not work, check with your service provider as there is likely a hardware failure.

Verify You Are Using the Correct Printer Driver

Verify you are using the proper driver for the printer. You should be using the driver that came on your Color StyleWriter software disks when you purchased your printer, or an updated version of that printer driver found at Apple Software Update sites.

Verify the Link LED is on when using 10Base-T

When you are using 10Base-T, make sure the Link indicator LED is on. If it is not, there is a problem with the 10Base-T line. Perhaps the network is not properly set up or terminated: check with your network support provider.

Restart the StyleWriter EtherTalk Adapter

Restart the StyleWriter EtherTalk Adapter.

- 1) Unplug the StyleWriter EtherTalk adapter from the power source.
- 2) Reconnect the StyleWriter EtherTalk adapter to the power source.

Make sure the Test/Power led is green, the Printer activity LED is yellow, and if 10Base-T is used, that the Link LED is green

Note:

It takes 20 or more seconds after power-on to go from red to green.

Color StyleWriter Stops Printing in Mid-Job

=====

PROBLEM:

The printer attached to the StyleWriter EtherTalk Adapter has stopped printing, in mid-job.

SOLUTION:

Check the LED Status on the StyleWriter EtherTalk Adapter

Under normal operation, the Test/Power LED is green, the Printer activity LED should be yellow, or blinking if it is processing a job, and if connected to 10Base-T, the Link light should be green. If data is being sent to the adapter, the yellow Ethernet activity LED will blink rapidly.

Check the Activity of the Printer and Ethernet LEDs

The yellow Printer activity LED should blink slowly. The yellow Ethernet activity LED should blink rapidly. If no printer activity is indicated, check if the device appears in the Chooser. If the device is not present in the Chooser, restart the StyleWriter EtherTalk Adapter.

Verify the StyleWriter EtherTalk Adapter Appears in the Chooser

If the StyleWriter EtherTalk Adapter is not in the Chooser, restart the StyleWriter EtherTalk Adapter by unplugging then replugging the power supply to the StyleWriter EtherTalk Adapter.

Verify That There Are No Macintosh System Dialogs

Check for error messages displayed on the Macintosh sending the print job, including paper out, door open, or other similar types of messages.

Desktop Print Monitor Status Reports Incorrect Information

PROBLEM:

The Desktop Print Monitor's status display reports incorrect information after the StylWriter EtherTalk Adapter is restarted.

SOLUTION:

Wait 2 minutes for the problem to clear. If it does not, restart your Macintosh. Prior to restarting, place the print job on hold. Once the Macintosh is restarted, take the job off of hold and printing will resume normally.

Macintosh "Crashed" or "Hung" During Print Job

PROBLEM:

The Macintosh "crashed" or "hung" during the print job. After restarting the Macintosh, the Macintosh is "frozen" and the print job is not completed but the Ethernet activity LED is blinking, indicating that data is being received.

SOLUTIONS:

Restart the StyleWriter EtherTalk Adapter by unplugging then replugging the power supply to the StyleWriter EtherTalk Adapter. Printing will resume normally.

Ethernet Activity LED Blinks, But Not Printer Activity LED

PROBLEM:

The Ethernet activity LED on the StyleWriter EtherTalk Adapter blinks but the Printer activity LED does not.

SOLUTION:

Restart the StyleWriter EtherTalk Adapter by unplugging then replugging the power supply to the StyleWriter EtherTalk Adapter.

General Information About Using the StyleWriter EtherTalk Adapter

=====

Names of the Color StyleWriter Printers

When using the CSW 2500 or CSW 1500 drivers with StyleWriter EtherTalk Adapter, the print dialog box indicates the driver name of either "Color StyleWriter 2500" or "Color StyleWriter 1500" followed by the name StyleWriter EtherTalk Adapter is currently assigned.

Rename the StyleWriter EtherTalk Adapter if you wish to reflect the type of printer connected it. For example, a StyleWriter EtherTalk Adapter connected to a Color StyleWriter 2500 could be named "StyleWriter EtherTalk 2500". In the Chooser you would see "StyleWriter EtherTalk 2500". When printing to the chosen printer the dialog would read Color StyleWriter 2500 "StyleWriter EtherTalk...".

Using QuickDraw GX version of Color StyleWriter Drivers

When using the CSW 2500 GX v1.0 or CSW 1500 GX v1.0 drivers, the CSW 2400 GX and the CSW 2200 GX drivers must be removed or disabled using the Extensions Manager Control Panel. You must restart your Macintosh after removing or disabling the old drivers.

LED Information in StyleWriter EtherTalk Adapter User's Guide

Refer to the StyleWriter EtherTalk Adapter user guide for additional information regarding the function of the LED's.

StyleWriter EtherTalk Adapter LED Locations

=====

LED are located on the top of the StyleWriter EtherTalk Adapter, and indicate:

Begin_Graphic

Power connetor, serial port

/		\	
	o		--> Test/Power (orange/green)
	o		--> Printer activity (yellow)
	o		--> Collision (orange)

End_Graphic

Article Change History:

08 Aug 1996 - Added information on proper printer driver.

Energy Saver Control Panel: Preferences Aren't in PRAM (7/96)

Revised: 7/18/96
Security: Everyone

Energy Saver Control Panel: Preferences Aren't in PRAM (7/96)

=====

Article Created: 18 July 1996

TOPIC -----

When I reset the Parameter RAM (PRAM) on a Macintosh computer that supports the Energy Saver control panel, what is the default sleep state? It is reset to shutdown in 25 minutes?

DISCUSSION -----

The Energy Saver sleep settings are not stored in PRAM, they are stored in the Energy Saver Preferences file, located in the Preferences folder within the System Folder. Moving or throwing the Energy Saver Preferences file away, and restarting your Macintosh resets the Energy Saver control panel back to the default sleep time of 30 minutes.

When the Macintosh restarts, if there is no preference file found, the control panel creates an alias to itself in the startup items folder so that each time you power on your Macintosh, the initial Energy Saver welcome screen displays. This screen explains the function of the Energy Saver control panel and provides you with an opportunity to modify the control panel default settings. Once you open the control panel, the alias is removed from the startup items folder and a preference file is created.

PowerBook 5300 Series: Determining Logic Board (7/96)

Article Created: 18 July 1996

TOPIC -----

How can I tell determine which PowerBook 5300 Logic Board I have?

DISCUSSION -----

Look at the serial number on the PowerBook 5300 logic board and use the chart below to determine which version of the logic board you have.

Begin_Table

Apple Svc. Part Number	RAM	VRAM	Description	Clock Speed	Logic Board Serial Number
661-0989	8 MB	512K	No chip on top, just sockets	100 MHz	FCXXXXXX55Y
661-0990	16 MB	512K	4 RAM chips on top, one VRAM socket	100 MHz	FCXXXXXX4VX
661-0991	16 MB	1 MB	No sockets	100 MHz	FCXXXXXX68J
661-0992	16 MB	1 MB	No sockets	117 MHz	FCXXXXXX55S

End_Table

Energy Saver Modes: Different Sleep Modes Explained (7/96)

Article Created: 18 July 1996

TOPIC -----

If I select Sleep from the Special Menu on my Power Macintosh 7200, it powers down my monitor and the monitor cools down. However, if I used the timed delay sleep mode in the Energy Saver control panel, the video signal disappears, but the monitor never cools. Why?

DISCUSSION -----

There is a difference in the way the two sleep functions work. Using the Sleep mode from the Special menu puts the monitor into a low-power state, but using the Energy Saver software just blanks the video with composite and vertical sync. still present.

The Energy Saver Control Panel was designed this way so that customers would not have to wait a long time for the display to warm-up from a cold start if the Display sleep was set separately at under 30 minutes.

Below is a table showing the video signals in the various modes.

Begin_Table

Pin	Signal	Description	W/Video	Sleep Menu	Energy Saver
1	RED.GND	Red vid. ground	GND	GND	GND
2	RED.VID	Red vid. signal	Video	No video	No video
3	/CSYNC	Comp. sync. signal	•Sync.	No sync.	Sync.
4	SENSE0	Monitor sense 0	--	--	--

5	GRN.VID	Green vid. signal	Video	No video	No video	
+-----+	+-----+	+-----+	+-----+	+-----+	+-----+	+-----+
6	GRN.GND	Green vid. ground	GND	GND	GND
